Radiotélégramme commence: de ... (nom du navire ou de l'aéronef);
Numéro ... (numéro de série du radiotélégramme);
Nombre de mots ...;
Date ...;
Heure ...(heure à laquelle de radiotélégramme a été déposé à bord du navire ou de l'aéronef);
Indications de service, s'il y a lieu;
Adresse ...;
Texte ...;
Signature ... (le cas échéant);
Transmission du radiotélégramme terminée, à vous.

MOD 8803 1281 5046 (2) En règle générale, les radiotélégrammes de toute nature transmis par les stations de navire sont numérotés par séries quotidiennes, en donnant le numéro 1 au premier radiotélégrammes transmis chaque jour à chaque station différente.

NOC 8804 1282 5047 (3) Il convient qu'une série de numéros commencée en radiotélégraphie soit continuée en radiotéléphonie et inversement.

NOC 8805 1283 5048 (4) Chaque radiotélégramme est transmis une seule fois par la station transmettrice. Toutefois, il peut en cas de nécessité être répété intégralement ou en partie par la station réceptrice ou par la station transmettrice.

NOC 8806 1285 5049 (5) Lors de la transmission de groupes de chiffres, chaque chiffre est transmis séparément et la transmission de chaque groupe ou série de groupes doit être précédée des mots «en chiffres».

NOC 8807 1286 5050 (6) Les nombre écris en lettres sont prononcés comme ils sont écrits ne faisant précéder leur transmission par les mots «en toutes lettres».

NOC 5051 **B3) Accusé de réception**

NOC 8808 1287 5052 § 33. (1) L'accusé de réception d'un radiotélégramme ou d'une série de radiotélégrammes est donnée sous la forme suivante:

L'indicatif d'appel ou tout autre signal d'identification de la station transmettrice;
Le mot ICI (ou DE épelé à l'aide des mots de code DELTA ECHO en cas de difficultés de langage);
L'indicatif d'appel ou toute autre signal d'identification de la station réceptrice;
«Reçu votre N°..., à vous» [ou R épélé à l'aide du mot de code ROMEO ... (nombre), K épelé à l'aide du mot de code KILO en cas de difficultés de langage]; *ou*
«Reçu vos N°... à N°... à vous» [ou R épelé à l'aide du mot de code ROMEU... (nombre), K épelé à l'aide du mot de code KILO en cas de difficultés de langage].

NOC 8809 1288 5053 (2) La transmission ne doit pas être considérée comme terminée en ce qui concerne un radiotélégramme, ou une série de radiotélégrammes, tant que cet accusé de réception n'a pas été dûment reçu.

NOC 8810 1289 5054 (3) La fin du travail entre deux stations est indiquée par chacune d'elles au moyen du mot «terminé» (ou $\overline{VA}$ épelé à l'aide des mots de code VICTOR ALFA en cas de difficultés de langage).

SECTION VI

Durée et direction du travail

NOC

MOD **8811** 1290 **5055** § 34. (1) La transmission de l'appel et des signaux préparatoires au trafic sur la fréquence porteuse 2182 kHz ou sur la fréquence 156,8 MHz ne doit pas dépasser une minute, sauf dans les cas de détresse, d'urgence ou de sécurité, auxquels s'appliquent les dispositions du chapitre IX.

MOD **8812** 1291 **5056** (2) Dans les communications entre station côtière et station de navire, la station de navire se conforme aux instructions données par la station côtière pour tout ce qui a trait à l'ordre et à l'heure de transmission, au choix de la fréquence, à la durée et à la suspension du travail.

MOD **8813** 1292 **5057** (3) Dans les communications entre stations de navire, la station appelée a la direction du travail selon les conditions indiquées au numéro **5056.** Cependant, si une station côtière estime nécessaire d'intervenir, les stations de navire se conforment à ses instructions.

SECTION VII

Essais

NOC

MOD **8814** 1293 **5058** § 35. Lorsqu'il est nécessaire pour une station de navire d'émettre des signaux d'essais ou de réglage susceptibles de brouiller le travail des stations côtières voisines, le consentement de ces stations doit être obtenu avant d'effectuer de telles émissions.

NOC **8815** 1294 **5059** § 36. (1) Lorsq'il est nécessaire pour une station de faire des signaux d'essais soit pour le réglage d'un émetteur avant de transmettre un apple, soit pour le réglage d'un récepteur, ces signaux ne doivent pas durer plus de dix secondes et doivent comprendre l'indicatif d'appel ou tour autre signal d'identification de la station qui émet pour essais: cet indicatif ou ce signal d'identifcation doit être prononcé lentement et distinctement.

MOD **8816** 1295 **5060** (2) Les émissions d'essai doivent être réduites au minimum en particulier:

Sur la fréquence porteuse 2182 kHz;
Sur la fréquence 156,8 MHz;
Sur la fréquence porteuse 4125 kHz dans la zone des Régions 1 et 2 située au sud du parallèle 15° Nord, y compris le Mexique, et dans la zone de la Région 3 située au sud du parallèle 25° Nord;
Sur la frequence porteuse 6215,5 kHz dans la zone de la Région 3 située au sud du parallèle 25° Nord.

NOC **8817** 1295A **5061** (3) Il est interdit de faire des émissions d'essai du signal d'alarme radiotéléphonique sur la fréquence porteuse 2182 kHz et sur la fréquence 156,8 MHz, sauf s'il s'agit d'un matériel de secours qui ne peut émettre que sur ces fréquences; dans ce cas, il y a lieu de prendre les mesures qui s'imposent pour éviter les rayonnement.Il faut également prendre des mesures visant à empêcher le rayonnement provenant des essais du signal d'alarme radiotéléphonique sur les fréquences autres que les fréquences 2182 kHz et 156,8 MHz.

5062 à **5084** *(Non attribués.)*

ADD **N62A**

ARTICLE 66

Correspondance publique dans le service mobile maritime et dans le service mobile maritime par satellite (1)

SECTION I

Généralités

8900 5085 § 1. Les dispositions du Règlement télégraphique et celles du Règlement téléphonique, compte tenu des Avis du CCITT, sont applicables aux radiocommunications tant que le présent Règlement n'en dispose pas autrement.

A.N62A **A.66** (1) Voir Résolution **201.**

SECTION II

Autorité chargée de la comptabilité

8901 **5086** § 2. Les taxes pour les radiocommunications dans le sens navire-terre doivent en principe, et conformément à la législation et à la pratique nationale, être perçues auprès du détenteur de la licence de station mobile maritime:

8902 **5087** *a*) Par l'administration qui a délivré la licence; *ou*

8903 **5088** *b*) Par une exploitation privée reconnue; *ou*

8904 **5089** *c*) Par tout (ou tous) autre(s) organisme(s) désigné(s) par l'administration mentionnée dans le numéro **5087.**

8905 **5090** § 3. Dans le présent article, l'administration ou l'exploitation privée reconnue ou l'(les) organisme(s) designé(s) sont dénommés «autorité chargée de la comptabilité».

8906 **5091** § 4. Le(s) nom(s) et adresse(s) de l'(des) autorité(s) chargée(s) de la comptabilité doivent être notifiés au Secrétaire général en vue de leur publication dans la Nomenclature des stations de navire; le nombre de ces noms et adresses doit être aussi réduit que possible, compte tenu des Avis du CCITT.

SECTION III

Comptabilité

8907 **5092** § 5. L'échange et la vérifications des comptes doivent être effectués conformément au Règlement télégraphique et au Règlement téléphonique, compte tenu des Avis du CCITT.

8908 **5093** § 6. Les comptes sont envoyés aussi rapidement que possible et tout cas avant la fin du troisième mois suivant celui auquel ils se rapportent.

8909 **5094** § 7. En principe, un compte doit être considéré comme accepté sans qu'il soit nécessaire d'en notifier explicitement l'acceptation à l'administration (ou exploitation privées reconnue) qui l'a présenté.

8910 **5095** § 8. Cependent, toute autorité chargée de la comptabilité a le droit de contester les éléments d'un compte dans un délai de six mois à compter de sa date d'envoi.

8911 **5096** § 9. Tous les comptes radiomaritimes doivent être réglés sans retard par l'autorité chargée de la comptabilité eu au plus tard six mois après l'envoi du compte.

8912 **5097** § 10. Si les comptes radiomaritimes internationaux ne sont pas réglés au bout de six mois, l'administration qui a délivré une licence à une station mobile doit, sur demande, prendre toutes les mesures possibles, dans les limites de la législation nationale en vigueur, pour obtenir du détenteur de la licence le règlement des comptes en souffrance.

8913 **5098** § 11. Dans le cas signalé au numéro **5095,** si le compte subit un retard important en cours d'acheminement, il convient que l'autorité chargée de la comptabilité qui attend le compte informe immédiatement l'administration (ou exploitation privée reconnue) d'origine que les demandes de renseignements éventuelles et le règlement sont susceptibles de subir des retards. Toutefois, le retard ne doit pas dépasser trois mois à partir de la date de réception du compte.

8914 **5099** § 12. L'autorité débitrice chargée de la comptabilité peut refuser le règlement et la rectification des comptes présentés plus de dix-huit mois après la date de dépôt des radiotélégrammes ou après la date d'établissement des communications radiotéléphoniques ou des communications radiotélex auxquels ces comptes se rapportent.

SECTION IV

Paiement des soldes

8915 **5100** § 13. Le paiement des soldes doit être effectué conformément au Règlement télégraphique et au Règlement téléphonique, compte tenu des Avis pertinents du CCITT.

SECTION V

Archives

8916 **5101** § 14. Les originaux des radiotélégrammes et les documents y relatifs, ainsi que ceux concernant les communications radiotéléphoniques et les communications radiotélex doivent être conservés par les administrations (ou exploitations privées reconnues), avec

toutes les précautions nécessaires à la sauvegarde du secret, jusqu'au règlement des comptes qui s'y rapportent et, en tout cas, pendant six mois à dater du mois au cours duquel les comptes ont été envoyés. Les administrations (ou exploitations privées reconnues) peuvent conserver ces informations par tout autre moyen, tel que enregistrements magnétiques ou électroniques.

8917 **5102** § 15. Toutefois, si une administration (ou exploitation privée reconnue) juge utile de détruire les originaux des radiotélégrammmes ou de n'importe quel autre document ou enregistrement mentionées dans le numéro **5101** avant l'expiration des délais indiqués ci-dessus et si, de ce fait, elle ne se trouve pas en mesure d'effectuer une enquête concernant des prestations dont elle est responsable, cette administration (ou exploitation privée reconnue) doit en supporter toutes les conséquences, aussi bien pour le remboursement des taxes que pour les différences qui pourraient être constatées dans les comptes en cause.

ARTICLE 69

Entrée en vigueur du Règlement des radiocommunications

MOD **9357** **5187**
1629

§ 1. Le présent Règlement des radiocommunications, qui est annexé à la Convention internationale des télécommunications, entrera en vigueur le 1er janvier 1982, à l'exception des dispositions des numéros **5188** et **5189**.

ADD **9357A** **5188**

§ 2. L'article 25 et l'appendice **43** — mais non les appendices **42** et **44** relatifs à cet article — et l'article 66 du présent Règlement entreront en vigueur le 1er janvier 1981.

ADD **9357B** **5189**

§ 3. Le «Plan d'allotissement de fréquences pour le service mobile aéronautique (R)» ainsi que les dispositions de l'appendice 27 Aer2 (*) au présent Règlement qui s'y rapportent directement entreront en vigueur à 00.01 heure UTC le 1er février 1983.

ADD **9357C** **5190**

§ 4. A la date d'entrée en vigueur de l'article 25 et le l'article 66 du présent Règlement, spécifiée au numéro **5188** (1er janvier 1981), les dispositions révisées du Règlement des radiocommunications (Genève, 1959):

a) Article 19, à l'exception des dispositions des numéros **745** à **747** et des appendices qui s'y rapportent; et

b) Les articles 38, 39, 40 et 40A, y compris les appendices 21, 21A et 22 y relatifs, ainsi que le Règlement additionel des radiocommunications,

seront abrogées et remplacées respectivement par les dispositions des articles 25 et 66 du présent Règlement.

MOD **9358** **5191**
1630

§ 5. A la date spécifiée au numéro **5187** (1er janvier 1982), toutes les autres dispositions du Règlement des radiocommunications (Genève, 1959), révisées en partie par:

a) La Conférence administrative extraordinaire des radiocommunications chargée d'attribuer des bandes de fréquences pour les radiocommunications spatiales (Genève, 1963);

b) La Conférence administrative extraordinaire des radiocommunications chargée d'élaborer un Plan d'allotissement révisé pour le service mobile aéronautique (R) (Genève, 1966);

c) La Conférence administrative mondiale des radiocommunications chargée de traiter de questions concernant le service mobile maritime (Genève, 1967);

d) La Conférence administrative mondiale des télécommunications spatiales (Genève, 1971);

e) La Conférence administrative mondiale des radiocommunications maritimes (Genève, 1974), et par

f) La Conférence administrative mondiale des radiocommunications du service aéronautique (R) (Genève, 1978),

seront abrogées et remplacées par les dispositions du présent Règlement.

ADD **9358A** **5192**

§ 6. Conformément à l'invitation formulée par la Conférence administrative mondiale des radiocommunications chargée d'établir un Plan pour le service de radiodiffusion par satellite dans les bandes de fréquences 11,7-12,2 GHz (Régions 2 et 3) et 11,7-12,5 GHz

(*) Note du Secrétariat général: voir le numéro **1314** et la Résolution **400**.

(Région 1) (Genève, 1977), les dispositions et le Plan associé adoptés par cette Conférence sont annexés, sous une forme appropriée qui n'altère ni leur contenu ni leur intégrité, en tant qu'appendice 30 au présent Règlement dont ils font partie intégrante.

MOD **API**

APPENDICE 1

(Voir l'article 12)

Introduction — L'appendice 1 se compose de six sections et d'une annexe:

Section A — Caractéristiques fondamentales à fournir dans le cas d'une notification aux termes des numéros **1214** à **1217** du Règlement des radiocommunications;

Section B — Caractéristiques fondamentales à fournir dans le cas d'une notification aux termes du numéro **1219** du Règlement des radiocommunications;

Section C — Caractéristiques fondamentales à fournir dans le cas d'une notification aux termes des numéros **1223** à **1227** du Règlement des radiocommunications;

Section D — Renseignements à communiquer pour une notification aux termes du numéro **1218** du Règlement des radiocommunications;

Section E — Modèle de fiche de notification;

Section F — Instructions générales:

I) Notes générales;

II) Notes concernant les reiseignements à insérer dans la fiche en vue de leur inscription dans les diverses colonnes du Fichier de référence;

Annexe — Carte des zones géographiques pour la radiodiffusion.

(MOD)

SECTION A

Caractéristiques fondamentales à fournir dans le cas d'une notification aux termes des numéros 1214 à 1217 du Règlement des radiocommunications

Colonne 1 Fréquence assignée.

Colonne 2c Date de mise en service.

Colonne 3 Indicatif d'appel (signal d'identification).

N'est pas une caractéristique fondamentale dans le cas des stations dont il est question au numéro **2055.1.**

Colonne 4a Nom de la station d'émission.

Colonne 4b Pays ou zone géographique où est située la station d'émission.

Colonne 4c Longitude et latitude de l'emplacement de l'émetteur.

Colonne 5a Nom de la station de réception.

N'est pas une caractéristique fondamentale dans le cas des stations de radiodiffusion, des stations terrestres, des stations terrestres de radionavigation, des stations terrestres de radiolocalisation, des stations de fréquences étalon et de signaux horaires et des stations à terre du service des auxiliares de la météorologie.

Colonne 5b Pays ou zone géographique où est située la station de réception.

N'est pas une caractéristique fondamentale dans le cas des stations de radiodiffusion, des stations terrestres, des stations terrestres de radionavigation, des stations terrestres de radiolocalisation, des stations de fréquences étalon et de signaux horaires et des stations à terre du service des auxiliaires de la météorologie.

Colonne 5c Longitude et latitude de l'emplacement de la station de réception.

N'est pas une caractéristique fondamentale dans le cas des stations de radiodiffusion, des stations terrestres, des stations terrestres de radionavigation, des stations terrestres de radiolocalisation, des stations de fréquences étalon et de signaux horaires et des stations à terre du service des auxiliaires de la météorologie.

Colonne 5d Localité ou zone(s) dans laquelle (lesquelles) sont situées les stations de réception.

N'est pas une caractéristique fondamentale que dans le cas des stations de radiodiffusion, des stations terrestres, des stations terrestres de radionavigation, des stations terrestres de radiolocalisation et des stations de fréquences étalon et de signaux horaires.

À utiliser seulement si la zone n'est pas suffisamment bien définie dans la colonne 5d.

Colonne 5e Longitude et latitude du centre de la zone circulaire de réception.

N'est une caractéristique fondamentale que dans le cas des stations terrestres, des stations terrestres de radionavegation, des stations terrestres de radiolocalisation et des stations de fréquences étalon et de signaux horaires.

A utiliser seulement si la zone n'est pas suffisamment bien définie dans la colonne 5d.

Colonne 5f Rayon nominal (km) de la zone circulaire de réception.

N'est une caractéristiques fondamentale que dans le cas des stations terrestres, des stations terrestres de radionavegation, des stations terrestres de radiolocalisation et des stations de fréquences étalon et de signaux horaires.

A utiliser seulement si la zone n'est pas suffisamment bien définie dans la colonne 5d.

Colonne 6 Classe de la station et nature du service effectué.

Colonne 7a Classe d'émission, largeur de bande nécessaire et nature de la transmission.

Colonne 7b Classe de fonctionnement de l'assignation.

N'est une caractéristique fondamentale que dans le cas des assignations aux stations du service fixe dans les bandes attribuées à ce service entre 3000 kHz et 27 500 kHz.

Colonne 8 Puissance (dBW).

Colonne 9a Azimut du rayonnement maximum.

Colonne 9b Angle de site pour lequel la directivité est maximale.

N'est une caractéristique fondamentale que pour les stations fonctionnant dans les bandes supérieures à 1 GHz attribuées en partage aux services de radiocommunication spatiale et aux services de radiocommunication de Terre; il doit être fourni avec une précision d'un dixième de degré (1).

Colonne 9c Angle d'ouverture du lobe principal de rayonnement.

N'est pas une caractéristique fondamentale si les données de la colonne 9j sont indiquées.

Colonne 9d Polarisation.

N'est une caractéristique fondamentale que pour les stations fonctionnant dans les bandes supérieures à 1 GHz attribuées en portage aux services de radiocommunication spatiale et de radiocommunication de Terre et pour les stations de radiodiffusion fonctionnant dans les bandes d'ondes décimétriques et métriques, dans Zones africaine et européenne de radiodiffusion.

Colonne 9e Hauteur d'antenne (mètres) pour une antenne verticale simple.

Ce renseignement est une caractéristique fondamentale pour les stations de radiodiffusion fonctionnant dans les bandes d'ondes kilométriques et hectométriques, dans la Région 1 et dans les bandes d'ondes hectométriques dans la Région 3.

Colonne 9f Hauteur maximale équivalente de l'antenne.

Ce renseignement est une caractéristique fondamentale pour les stations de radiodiffusion à ondes métriques et décimétriques dans les Zones africaine et européenne de radiodiffusion. Il est défini dans les Actes finals des conférences appropriées.

Ce renseignements est une caractéristique fondamentale pour les stations de Terre fonctionnant dans les bandes supérieures à 1 GHz qui sont partagées entre services spatiaux et services de Terre. Il doit être indiqué en mètres au-dessus du niveau moyen de la mer.

Colonne 9g Gain d'antenne maximal (isotrope, par rapport à une antenne verticale courte ou par rapport à un doublet demi-onde, selon le cas).

N'est pas une caractéristique fondamentale si la puissance apparente rayonnée, ou la p. i. r. e., est notifiée dans la colonne 8 ou si les données de la colonne 9j sont indiquées.

Colonne 9h Azimuts définissant les secteurs de rayonnement limité, en degrés (dans le sens des aiguilles d'une montre) par rapport au Nord vrai.

Ce renseignement est une caractéristique fondamentale pour les stations de radiodiffusion fonctionnant dans les bandes d'ondes kilométriques et hectométriques, dans la Région 1 et dans les bandes hectométriques dans la Région 3.

---

(1) Ce renseignement ne sera fourni avec une précision d'un dixième de degré que si la station est située dans la zone de coordination d'une station terrienne ou si la direction du rayonnement maximal ne s'écarte pas de plus de trois degrés de l'orbite des satellites geostationnaires.

Colonne 9i Rayonnement maximal admis dans les secteurs.

Ce renseignement est une caractéristique fondamentale pour les stations de radiodiffusion fonctionnant dans les bandes d'ondes kilométriques et hectométriques, dans la Région 1 et dans les bandes d'ondes hectométriques dans la Région 3.

Colonne 9j Type d'antenne (voir le Manuel du CCIR intitulé *Diagrammes d'antennes*).

N'est pas une caractéristique fondamentale si les données des colonnes 9c et 9g sont indiquées.

Colonne 10b Horaire normal (UTC) de fonctionnement de l'assignation de fréquence.
Colonne 11 Coordination avec d'autres administrations.

Ce renseignement est une caractéristique fondamentale pour les bandes et services concernés.

Renseignements supplémentaires:

a) Indiquer la ou les *fréquences de référence* chaque fois qu'une émission déterminée en comporte, par exemple la fréquence de l'onde porteuse réduit d'une émission à bande latérale unique ou à bandes latérales indépendantes, ou les fréquences des ondes porteuses du son et de l'image d'une émission de télévision;
b) Toute coordination requise aux termes des numéros **1148 à 1154;**
c) Nom de toute administration avec laquelle un accord a été conclu en vue de dépasser les limites prescrites dans le présent Règlement, et contenu de cet accord.

SECTION B

Caractéristiques fondamentales à fournir dans le cas d'une notification aus termes du numéro 1219 du Règlement des radiocommunications

Colonne 1 Fréquence assignée.
Colonne 2c Date de mise en service.
Colonne 4a Nom de la station d'émission: inscrire la lettre «M» (pour mobile).
Colonne 4b Indiquer le pays ou la zone géographique où sont situées les stations mobiles d'émission.
Colonne 4c Indiquer les coordonnées géographiques (longitude et latitude en degrés et minutes) du centre de la zone circulaire d'émission.
Colonne 4d Indiquer le rayon nominal (km) de la zone circulaire d'émission.
Colonne 4e Indiquer une zone pour laquelle il existe une définition normalisé au moyen des symboles contenus dans les références normalisées, par exemple ZLAMP, ZLARN, zones géographiques, etc. (voir également la Préface à la Liste internationale des fréquences).
Colonne 5a Nom de la station de réception.
Colonne 5b Pays ou zone géographique où est située la station de réception.
Colonne 5c Indiquer les coordonnées géographiques (longitude et latitude en dégres et en minutes) de l'emplacement de la station de réception.
Colonne 6 Classe des stations mobiles et nature du service effectué.
Colonne 7a Classe d'émission des stations mobiles, largeur de bande nécessaire et nature de la transmission.
Colonne 8 Puissance (dBW).
Colonne 10b Horaire normal (UTC) de fonctionnement de l'assignation de fréquence.

Renseignements supplémentaires:

a) Toute coordination requise aux termes des numéros **1148 à 1154;**
b) Nom de toute administration avec laquelle un accord a été conclu en vue de dépasser les limites prescrites dans le présent Règlement, et contenu de cet accord.

SECTION C

Caractéristiques fondamentales à fournir dans le cas d'une notification aux termes des numéros 1223 à 1227 du Règlement des radiocommunications

Colonne 1 Fréquence assignée.
Colonne 2c Date de mise en service.
Colonne 4b Indiquer le pays ou la zone géographique où est située la station d'émission.

Pour le reste de la colonne *4*, remplir soit *4e* seulement, soit *4c* et *4d*.

Colonne 4c Indiquer les coordonnées géographiques (longitude et latitude en degrés et minutes) du centre de la zone circulaire d'émission.
Colonne 4d Indiquer le rayon nominal (km) de la zone circulaire d'émission.
Colonne 4e Indiquer une zone pour laquelle il existe une définition normalisée, en utilisant les symboles indiqués dans la Préface à la Liste internationale des fréquences.
Colonne 6 Classe de la station et nature du service effectué.
Colonne 7a Classe d'émission, largeur de bande nécessaire et nature de la transmission.
Colonne 8 Puissance (dBW).

Colonne 10b Horaire normal (UTC) de fonctionnement de l'assignation de fréquence.

Renseignements supplémentaires:

Nom de toute administration avec laquelle un accord a été conclu en vue de dépasser les limites prescrites dans le présent Règlement, et contenu de cet accord.

SECTION D

Renseignements à communiquer pour une notification aux termes du numéro 1218 du Règlement des radiocommunications

1. *Instructions générales:*

a) L'assistance de l'IFRB porte sur le choix d'une ou de plusieurs fréquences pour une assignation à une station du service fixe, dans les bandes de fréquence comprises entre 3000 kHz et 27 500 kHz attribuées à ce service;

b) L'administration fournira:

Une description générale des difficultés rencontrées;

Les renseignements techniques et tous autres renseignements pouvant orienter les recherches ultérieures de l'IFRB;

c) Les instructions données la section F peuvent également s'appliquer.

2. *Renseignements à fournir pas l'administration:*

Colonne 1 Fréquence.

1) Laisser cette colonne en blanc ou indiquer la bande préférée si la demande porte sur le choix d'une fréquence ou d'un jeu fréquences pour la liaison en question;
2) Si la demande porte sur une fréquence déterminée, spécifier cette fréquence.

Colonne 2c Date de mise en service.

Indiquer la date proposée pour la mise en service de l'assignation de fréquence.

Colonne 3 Indicatif d'appel (signal d'identification).

Colonne 4 Caractéristique de la station d'émission.

Colonne 4a Indiquer le nom de la localité par lequel la station d'émission est désignée ou dans laquelle elle est située.

Colonne 4b Indiquer le pays ou la zone géographique où est située la station. Il convient d'utiliser à cet effet les symboles figurant dans la Préface à la Liste internationale des fréquences.

Colonne 4c Indiquer les coordonnées géographiques (longitude et latitude en degrés et minutes) de l'emplacement de l'émetteur.

Colonne 5 Caractéristiques de la station de réception.

Colonne 5a Nom de la station de réception. Indiquer le nom de la localité par lequel la station de réception est désignée ou dans laquelle elle est située. A condition que, dans une zone donnée, la zone de réception soit bien définie et suffisamment réduite pour prévoir aisément les conditions d'utilisation de la fréquence du point de vue de la propagation, il suffit de notifier un nombre de stations suffisant pour délimiter la zone de réception.

Colonne 5b Pays ou zone géographique où est située la station de réception.

Colonne 5c Indiquer les coordonnées géographiques (longitude et latitude en degrés et minutes) de l'emplacement de la station de réception.

Colonne 6 Classe de la station et nature du service effectué.

Au moyen des symboles figurant à l'appendice **10**, indiquer la classe de la station et la nature du service effectué.

Colonne 7a Classe d'émision, largeur de bande nécessaire et nature de la transmission.

Indiquer, pour chacune des localités ou zones de réception mentionnées dans la colonne *5a*, la classe de l'émission, la largeur de bande nécessaire et la nature de la transmission, conformément à l'article 4 et à l'appendice **6**.

Colonne 8 Puissance (dBW).

1) Selon la classe d'émission, indiquer de la façon suivante la puissance fournie à la ligne d'alimentation de l'antenne (dBW):

a) Puissance moyenne (PY) s'il s'agit d'une émission à modulation d'amplitude à onde porteuse complète non manipulée ou d'une émission à modulation de fréquence (voir le numéro **152**);

b) Puissance en crête (PX) s'il s'agit d'une émission autre que celles dont il est question en *a*) ci-dessus (voir le numéro **151**);

c) Laisser en blanc si la puissance doit être calculée par l'IFRB;

2) Indiquer la puissance normalement utilisée vers chacune des localités ou zones de réception mentionnées dans la colonne *5a*.

Colonne 9 Caractéristiques de l'antenne d'émission (indiquer tous les reinseignements disponibles).
Colonne 9a Azimut du rayonnement maximum.

1) Si l'on utilise une antenne d'émission à effet directif, indiquer l'azimut du rayonnement maximum de cette antenne, en degrés, à partir du Nord vrai dans le sens des aiguilles d'une montre;
2) Si l'on utilise une antenne d'émission sans effet directif, inscrire «ND» dans cette colonne.

Colonne 9c Si les caractéristiques de rayonnement de l'antenne concernée diffèrent des caractéristiques recommandées par le CCIR, inscrire les renseignements demandés dans les colonnes *9c* et *9g*. Lorsque les caractéristiques de rayonnement se trouvent dans le manuel *Diagrammes d'antennes* du CCIR, indiquer la référence dans la colonne *9j*.
Colonne 9c Angle d'ouverture du lobe principal de rayonnement.

Il convient d'indiquer l'angle total mesuré en projection horizontale dans un plan contenant la direction du rayonnement maximal, en degrés, à l'intérieur duquel la puissance rayonnée dans une direction quelconque n'est pas inférieure de plus de 3 dB à la puissance rayonnée dans la direction du rayonnement maximum.

Colonne 9g Gain d'antenne.

Il convient d'indiquer le gain relatif de l'antenne dans la direction du rayonnement maximum pour la fréquence assignée (voir le numéro **154**).

Colonne 9j Type d'antenne (voir le Manuel *Diagrammes d'antennes* du CCIR).

Indiquer la reférence appropriée au Manuel *Diagrammes d'antennes* du CCIR. Voir ci-dessus les colonnes *9c* et *9g*.

Colonne 10 Horaire de fonctionnement.
Colonne 10a Horaire maximum (UTC) de fonctionnement de la liaison vers chaque localité ou zone.

A titre de reiseignement supplémentaire, indiquer par la lettre «I» les périodes pendant lesquelles le fonctionnement de la liaison est intermittent.

Colonne 10b Horaire normal (UTC) de fonctionnement de l'assignation de fréquence.

Indiquer l'horaire en temps universel coordonné (UTC) au moyen d'un groupe de quatre chiffres (0000 à 2359). Sinon, indiquer les heures de fonctionnement diurne (HJ), nocturne (HN) ou l'horaire de service en période de transition (HT).

Colonne 11 Coordination avec d'autres administrations.

Le cas échéant, indiquer le pays ou la zone géographique avec lequel la coordination pertinent a été effectuée avec succès.

Colonne 12a Administration ou compagnie exploitante.
Colonne 12b Adresse postale et adresse télégraphique de l'administration dont relève la station.

Renseignements supplémentaires:

Indiquer tous les renseignements disponibles concernant l'antenne de réception.

MOD

SECTION E

Modèle de fiche de notification

Le Comité établit et tient à jour un modèle de fiche de notification de manière à respecter la totalité des dispositions réglementaires du présent appendice et les décisions connexes des conférences futures.

SECTION F

Instructions générales

1. Une fiche distincte doit être envoyées au Comité international d'enregistrement des fréquences pour notifier:

Chaque nouvelle assignation de fréquence;
Toute modification aux caractéristiques d'une assignation de fréquence inscrite dans le Fichier de référence international des fréquences, dénommé ci-aprés *Fichier de référence;*
Toute annulation totale d'une assignation de fréquence inscrite dans le Fichier de référence.

2. Lorsqu'une assignation de fréquence est utilisée par une station pour assurer différents services, une fiche distincte doit être envoyée pour chaque type de service (par exemple FA, FB, FC, FX, etc.).

3. Les fréquences prescrites dans le présent Règlement comme devant être utilisées en commun conformément à la Préface à la Liste internationale des fréquences ne font pas l'objet de notification (voir le numéro **1220**).

4. Dans les colonnes *5a* à *10*, il convient d'inscrire séparément les caractéristiques lorsqu'elles ne sont pas valables pour la totalité de l'assignation, par exemple lorsque la classe d'émission ou la puissance diffèrent selon les localités ou zones de réception.

5. En ce qui concerne les stations de télévision de la Région 1, des fiches de notification distinctes doivent être présentées pour la voie son et la voie image respectivement. En pareil cas, les fréquences à indiquer sont celles des ondes porteuses du son et de l'image.

NOC

1. Notes générales

a) Indiquer le nom de l'administration dont émane la fiche de notification.

b) Porter la lettre «X» dans cette case lorsque la fiche a trait à:

La première utilisation d'une fréquence par une station;
Ou la première utilisation d'une fréquence supplémentaire par une station.

c) Porter la lettre «X» dans cette case lorsque la fiche a trait à une modification aux caractéristiques d'une assignation de fréquence inscrite dans le Fichier de référence:

1) Au cas où des caractéristiques existantes (y compris la fréquence) sont modifiées, il convient d'indiquer, à l'emplacement approprié, les nouvelles caractéristiques, de les souligner et de mentionner au-dessous ou à côté, entre parenthèses, les caractéristiques originales qui sont modifiées;
2) Au cas où la modification consiste en une adjunction aux caractéristiques existentes, il convient d'indiquer, à l'emplacement approprié, les caractéristiques ajoutées et de les souligner;
3) Au cas où la modification consiste en l'annulation d'une ou de plusieurs caractéristiques, il convient d'indiquer ceci par un trait à l'emplacement approprié et de mentionner au-dessous ou à côté de ce trait, entre parenthèses, la ou les caractéristiques annulées.

d) Porter la lettre «X» dans cette case lorsque la fiche a trait à l'annulation de la totalité des caractéristiques notifiées d'une assignation.

e) Le numéro de série de la fiche et la date de son envoi au Comité doivent être indiqués ici.

II. Notes concernant les renseignements à insérer dans la fiche en vue de leur inscription dans les diverses colonnes du Fichier de référence

Colonne 1 Fréquence assignée.

1) Indiquer la fréquence assignée (1) (2) (3) telle qu'elle est définie à l'article 1: en kWz jusqu'à 28 000 kHz compris, en MHz au-dessus de 28 000 kHz et jusqu'à 10 500 MHz compris et en GHz au-dessus de 10 500 MHz;
2) *Ce renseignement est une caractéristique fondamentale.*

Colonne 2c Date de mise en service.

1) Dans le cas d'une nouvelle assignation, indiquer la date de mise en service effective ou prévue, selon le cas, de l'assignation de fréquence;
2) Lors d'une modification de l'une quelconque des caractéristiques fondamentales d'une assignation, telles qu'elles sont définies dans le présent appendice, à l'exception de celles qui figurent dans les colonnes *3*, *4a*, *10a* ou *11*, la date à inscrire dans cette colonne doit être celle de la dernière modification effective ou prévue, selon de cas;
3) *Ce renseignement est une caractéristique fondamentale.*

Colonne 3 Indicatif d'appel (signal d'identification).

1) Inscrire l'indicatif d'appel ou tout autre signal d'identification utilisé aux termes de l'article 25;
2) *Ce renseignement est une caractéristique fondamentale, sauf dans les cas dont il est question aux numéros* **1224** *à* **1227** *et* **2055.1** *ou lorsqu'il s'agit d'une fréquence utilisée à la réception dans les circonstances spécifiées au numéro* **1219.**

(1) En ce qui concerne les stations de télévision de la Région 1, les fréquences à notifier sont celles des ondes porteuses du son et de l'image.
(2) En ce qui concerne les stations radiotéléphoniques du service mobile maritime, voir le numéro **4194**.
(3) En ce qui concerne les stations du service mobile aéronautique (R), voir le paragraphe 27/72 révisé de l'appendice 27 Aer2.

Colonne 4 Caractéristiques de la station d'émission.

Si l'assignation de fréquence est utilisée dans les circonstances spécifiées aux numéros **1214** *à* **1217** *les caractéristiques fondamentales à inscrire dans la colonne 4 sont les suivantes:*

Colonne 4a Indiquer le nom de la localité par lequel la station d'émission est désignée ou dans laquelle elle est située.

Colonne 4b Indiquer le pays ou la zone géographique où est située la station. Il convient d'utiliser à cet effet les symboles figurant dans la Préface à la Liste internationale des fréquences.

Colonne 4c Indiquer les coordonnées géographiques (longitude et latitude en degrés et minutes) de l'emplacement de l'émetteur. Lorsqu'il s'agit d'assignations de fréquence au-dessus de 1 GHz dans les bandes utilisées en partage par les services de radiocommunication de Terre et de radiocommunication spatiale, indiquer les coordonées géographiques (longitude et latitude en degrés, minutes et secondes à un dixième de minute près (1); on peut aussi indiquer la longitude et la latitude en degrés et minutes et, dans la colonne *9a*, l'azimut du rayonnement maximum de l'antenne à un dixième de degré près).

Si l'assignation de fréquence est utilisée à la réception dans les circonstances spécifiées au numéro **1219**, *les caractéristiques fondamentales à inscrire dans la colonne 4 sont les suivantes:*

Colonne 4a Nom de la station d'émission: inscrire la lettre «M» (pour mobile).

Colonne 4b Indiquer le pays ou la zone géographique où sont situées les stations mobiles d'émission. Si les stations ne sont pas situées dans un pays, indiquer le pays responsable. Il convient d'utiliser à cet effet les symboles figurant dans la Préface à la Liste internationale des fréquences.

Colonne 4c Indiquer les coordonnées gépgraphiques (longitude et latitude en degrés et minutes) du centre de la zone circulaire d'émission.

Colonne 4d Indiquer le rayon nominal (km) de la zone circulaire d'émission.

Colonne 4e Indiquer une zone pour laquelle il existe une définition normalisée au moyen des symboles contenus dans les références normalisées, par exemple, ZLAMP, ZLARN, zones géographiques, etc. (voir également la Préface à la Liste internationale des fréquences).

Si l'assignation de fréquences est utilisée dans les circonstances spécifiées aux numéros **1223** *à* **1227**, *les caractéristiquies fondamentales à inscrire dans la colonne 4 sont les suivantes:*

Colonne 4b Indiquer le pays ou la zone géographique où est située la station. Il convient d'utiliser à cet effet les symboles figurant dans la Préface à la Liste internationale des fréquences.
Le reste de la colonne *4* se compose soit de *4e* seulement, soit de *4c* et *4d*.

Colonne 4c Indiquer les coordonnées géographiques (longitude et latitude en degrés et minutes) du centre de la zone circulaire d'émission.

Colonne 4d Indiquer le rayon nominal (km) de la zone circulaire d'émission.

Colonne 4e Indiquer une zone pour laquelle il existe une définition normalisée, en utilisant les symboles figurant dans la Préface à la Liste internationale des fréquences.

Colonne 5 Caractéristiques de la station de réception.

Si l'assignation de fréquence est utilisée dans les circonstances spécifiées aux numéros **1214** à **1217**, *les caractéristiques fondamentales à inscrire dans la colonne 5 sont les suivantes:*

Colonne 5a Nom de la station de réception. Indiquer le nom de la localité par lequel la station de réception est désignée ou dans laquelle elle est située.

1) A condition que, dans le service fixe, la zone de réception soit bien définie et suffisamment réduite pour prévoir aisément les conditions d'utilisation de la fréquence du point de vue de la propagation, il suffit de notifier un nombre de stations suffisant pour délimiter la zone de réception;
2) Toutefois, dans le cas des stations de radiodiffusion, des stations terrestres de radionavigation, des stations terrestres de radiolocalisation, des stations de fréquences étalon et de signaux horaires et des stations à terre du service des auxiliaires de la météorologie, il n'est pas nécessaire d'inscrire quoi que ce soit dans cette colonne;
3) Dans le cas d'un réseau de stations communiquant entre elles sur la même fréquence inscrire dans la colonne *5a* le symbole ZN. Lorsque la même fréquence est utilisée par plusieurs réseaux relevant de la même administration, il convient de désigner chaque réseau par une lettre distincte placée à la suite du symbole ZN, par exemple ZN-A, ZN-B, etc.;
4) Dans le cas d'un réseau, de même que dans le cas où de nombreuses stations relevant d'une même administration utilisent la même fréquence dans une zone déterminée, il est nécessaire de notifier seulement un nombre de stations suffisant pour dèlimiter la zone d'utilisation de la fréquence, pourvu que cette zone soit bien définie et suffisamment réduite pour que, compte tenu des conditions de propagation, on puisse aisément prévoir les conditions d'utilisation de la fréquence.

---

(1) Les seconds ne seront notifiées avec une précision d'un dixième de minute que dans le cas où la station est située dans la zone de coordination d'une station terrienne.

Colonne 5b Pays ou zone géographique où est située la station de réception. Il convient d'utiliser à cet effet les symboles figurant dans la Préface à la Liste internationale des fréquences.

Toutefois, dans le cas des stations de radiodiffusion, des stations terrestres, des stations terrestres de radionavigation, des stations de fréquences étalon et de signaux horaires et des stations à terre du service des auxiliaires de la météorologie, il n'est pas nécessaire d'inscrire quoi que ce soit dans cette colonne.

Colonne 5c Indiquer les coordonnées géographiques (longitude et latitude en degrés et en minutes) de l'emplacement de la station de réception.

Toutefois, dans le cas des stations de radiodiffusion, des stations terrestres, des stations terrestres de radiolocalisation, des stations de fréquences étalon et de signaux horaires et des stations à terre du service des auxiliaires de la météorologie, il n'est pas nécessaire d'inscrire quoi que ce soit dans cette colonne.

Colonne 5d Localité ou zone(s) dans laquelle (lesquelles) la (les) station(s) de réception est (sont) située(s).

1) Pour les stations de radiodiffusion, il convient d'indiquer la zone de réception. Chaque zone doit être caractérisée de la manière suivante:

Intérieure (INTR);
Ou symbole désignant un ou des pays ou zone(s) géographique(s) (Préface à la Liste internationale des fréquences);
Ou l'une des zones géographiques délimitées sur la carte annexée au présent appendice. Si la zone de réception ne peut être définie de la manière ci-dessus, il faut remplir les colonnes *5e* et *5f*.

N'est pas une caractéristique fondamentale dans le cas des stations de radiodiffusion fonctionnant dans les bandes d'ondes kilométriques/hectométriques ou métriques/décimétriques, sauf spécification dans un accord régional pertinent.

2) Pour les stations terrestres, les stations terrestres de radionavigation, les stations terrestres de radiolocalisation, les stations de fréquences étalon et de signaux horaires et les stations à terre du service des auxiliaires de la météorologie, n'indiquer une zone de réception que si elle fait l'objet d'une description normalisée. Si tel n'est pas le cas, inscrire les renseignements relatifs à cette zone dans les colonnes *5e* et *5f*.

Colonne 5e Longitude et latitude du centre de la zone circulaire de réception.

1) Indiquer les coordonnées géographiques (degrés et minutes);
2) Cette colonne n'est pas à utiliser si la zone de réception est suffisamment bien définie dans la colonne *5d*. Si la colonne *5e* est utilisée, une inscription correspondante doit être faite dans la colonne *5f*.

Colonne 5f Rayon nominal de la zone circulaire de réception.

1) Indiquer la rayon (km) de la zone circulaire de réception;
2) Cette colonne n'est pas à utiliser si la zone de réception est suffisamment bien définie dans la colonne *5d*. Si la colonne *5f* est utilisée, une inscription correspondante doit être faire dans la colonne *5e*.

Si l'assignation de fréquence est utilisée dans les circonstances spécifiées au numéro **1219**, *les caractéristiques fondamentales à inscrire dans la colonne 5 sont les suivantes:*

Colonne 5a Nom de la station de réception. Indiquer le nom de la localité par lequel la station de réception est désignée ou dans laquelle elle est située.

Colonne 5b Pays ou zone géographique où est située la station de réception. Il convient d'utiliser, à cet effet, les symboles figurant dans la Préface à la Liste internationale des fréquences.

Colonne 5c Indiquer les coordonnées géographiques (longitude et latitude en degrés et en minutes) de l'emplacement de la station de réception.

Si l'assignation de fréquence est utilisée dans les circonstances spécifiées aux numéros **1223** *à* **1227**, *il n'est pas nécessaire d'inscrire quoi que ce soit dans la colonne 5.*

Colonne 6 Classe de la station et nature du service effectué.

1) Au moyen des symboles figurant à l'appendice **10**, indiquer la classe de la station et la nature du service effectué;
2) Lorsqu'il s'agit d'une fréquence utilisée à la réception dans les circonstances spécifiées au numéro **1219**, c'est la classe des stations mobiles et la nature du service qu'elles effectuent qu'il convient d'indiquer;
3) *Ces renseignements sont des caractéristiques fondamentales.*

Colonne 7 Classe d'émission et classe de fonctionnement.
Colonne 7a Classe d'émission, largeur de bande nécessaire et nature de la transmission.

1) Indiquer pour chacune des localités ou zones de réception mentionnées dans la colonne *5a*, la classe de l'émission, la largeur de bande nécessaire et la nature de la transmission, conformément à l'article 4 et à l'appendice **6**;
2) Lorsqu'il s'agit d'une fréquence utilisée à la réception dans les circonstances spécifiées au numéro **1219**, les caractéristiques à indiquer sont celles des stations mobiles;
3) *Ces renseignements sont des caractéristiques fondamentales.*

Colonne 7b Classe de fonctionnement de l'assignation.

Ce renseignement est une caractéristique fondamentale. Pour les assignations à des stations du service fixe dans les bandes de fréquences attribuées à ce service entre 3000 kHz et 27 500 kHz, indiquer la classe de fonctionnement de l'assignation au moyen des symboles A, B ou C comme suit:

Symbole A — Assignation destinée à être utilisée pour exploitation régulière qui n'est pas assurée par un autre moyen satisfaisant de télécommunication;
Symbole B — Assignation destinée à être utilisée comme assignation de réserve pour un autre moyen de télécommunication;
Symbole C — Assignation pour utilisation occasionnelle en réserve n'exigeant pas de protection internationalement reconnue contre les brouillages préjudiciables.

Colonne 8 Puissance (dBW).

1) Selon la classe d'émission, indiquer de la façon suivante la puissance, en dBW, fournie à la ligne d'alimentation de l'antenne:
   a) Puissance de la porteuse (PZ) s'il s'agit d'une émission de radiodiffusion sonore de classe A3E (voir le numéro **153**);
   b) Puissance moyenne (PY) s'il s'agit d'une émission à modulation d'amplitude à onde norteuse complète non manipulée, autre qu'une émission de radiodiffusion sonore, ou d'une émission à modulation de fréquence (voir le numéro **152**);
   c) Puissance en crête (PX) s'il s'agit d'une émission autre que celles dont il est question en *a*) et *b*) ci-dessus, y compris les émissions de télévision (image) de classe C3F (voir le numéro **151**).
2) Dans les bandes supérieures à 28 000 kHz qui ne sont pas attribués sur la base du partage aux services de radiocommunication spatiale et aux services de radiocommunication de Terre exception faite des fiches de notification visées aux numéros **1223** à **1227**, il convient de notifier la puissance apparente rayonnée (voir le numéro **156**);
3) Dans les bandes supérieures à 1 GHz, attribuées sur la base du partage aux services de radiocommunication spatiale et aux services de radiocommunication de Terre, il convient de notifier la puissance isotrope rayonnée équivalente (p. i. r. e.) (voir le numéro **155**);
4) Le symbole approprié PZ, PY ou PX doit suivre l'indication de la valeur de la puissance. S'il s'agit de la puissance apparente rayonnée, ce symbole doit être suivi de la lettre «e». S'il s'agit de la p. i. r. e., ce symbole doit être suivi de la lettre «i»;
5) Indiquer la puissance normalement utilisée vers chacune des localités ou zones de réception;
6) Lorsqu'il s'agit d'une fréquence utilisée à la reception dans les circonstances spécifiés au numéro **1219**, il convient d'indiquer la puissance des stations mobiles. Si celles-ci ne sont pas toutes de même puissance, c'est la puissance la plus élevée qu'il convient d'indiquer;
7) *Ce renseignement est une caractéristique fondamentale.*

Colonne 9 Caractéristiques de l'antenne d'émission.
Colonne 9a Azimut du rayonnement maximum.

1) Si l'on utilise une antenne d'émission à effet directif, indiquer l'azimut du rayonnement maximum de cette antenne, en degrés, à partir du Nord vrai dans le sens des aiguilles d'une montre;
2) Si l'on utilise une antenne d'émission sans effet directif, inscrire «ND» dans cette colonne;
3) Pour les assignations de fréquence supérieures à 1 GHz dans les bandes partagées entre services de radiocommunication de Terre et services de radiocommunication spatiale, indiquer l'azimut avec une précision d'un dixième de degré (1) dans le cas où la précision avec laquelle les coordonnnées géographiques doivent être indiquées [un dixième de minute (2)] n'a pas été spécifiée dans la collone *4c*;
4) *Ce renseignement est une caractéristique fondamentale sauf lorsqu'il s'agit de stations dont il est question aux numéros* **1223** *à* **1227** *ou d'une fréquence utilisée à la réception dans les circonstances spécifiée au numéro* **1219.**

---

(1) Ce renseignement ne sera fourni avec une précision d'un dixième de dégre que si la station est située dans la zone de coordination d'une station terrienne ou si la direction du rayonnement maximal ne s'écarte pas de plus de trois degrés de l'órbite des satellites géostationnaires.

(2) Les secondes ne seront notifiées avec une précision d'un dixième de minute que dans le cas où la station est située dans la zone de coordination d'une station terrienne.

Colonne 9b Agle de site pour lequel la directivité est maximale.

N'est une caractéristique fondamentale que pour les stations fonctionnant dans les bandes superieures à 1 GHz attribuées en partage aux services de radiocommunication spatiale et aux services de radiocommunication de Terre; il doit être fourni avec une précision d'un dixième de degré (1).

Collone 9c et 9g Si les caractéristiques de rayonnement de l'antenne concernée diffèrent des caractéristiques recommandées par le CCIR, inscrire les renseignements demandés dans les colonnes *9c* et *9g*. Lorsque les caractéristiques de rayonnement se trouvent dans le Manuel du CCIR intitulé Diagrammes d'antennes, indiquer la réference dans la colonne *9j*.

Colonne 9c Angle d'ouverture du lobe principal de rayonnement.

Il convient d'indiquer l'angle total mésure en projection horizontale dans un plan contenant la direction du rayonnement maximal, en degrés, à lintérieur duquel la puissance rayonnée dans une direction quelconque n'est pas inférieure de plus de 3 dB á la puissance rayonnée dans la direction du rayonnement maximum.

Colonne 9d Polarisation.

Ce renseignement est une caractéristique fondamentale pour les stations fonctionnant dans les bandes supérieures à 1 GHz attribuées en partage aux services de radiocommunication spatiale et de radiocommunication de Terre et pour les stations de radiodiffusion fonctionnant dans les bandes d'ondes métriques et décimétriques dans les Zones africaine et européenne de radiodiffusion.

Colonne 9e Hauteur d'antenne (mètres) pour une antenne verticale simple.

Ce renseignement est une caractéristique fondamentale pour les stations de radiodiffusion fonctionnant dans les bandes d'ondes kilométriques et hectométriques dans la Région 1 et dans les bandes d'ondes hectométriques dans la Région 3.

Colonne 9f Hauteur équivalent maximale de l'antenne.

Ce renseignement est une caractéristique fondamentale pour les stations de radiodiffusion fonctionnant dans les bandes d'ondes métriques et décimétriques dans les Zones africaine et européene de radiodiffusion. Cette hauteur est définie dans les Actes finals des conférences correspondantes;

Ce renseignement est une caractéristique fondamentale pour les stations de Terre fonctionnant dans les bandes supérieures à 1 GHz qui sont partagées entre services de radiocommunication spatiale et services de radiocommunication de Terre. Cette hauteur doit être indiquée en mètres au-dessus du niveau moyen de la mer.

Colonne 9g Gain d'antenne maximal (isotrope, par rapport à une antenne verticale courte ou par rapport à un doublet demi-onde, selon le cas).

1) Il convient d'indiquer le gain relatif de l'antenne dans la direction du rayonnement maximum pour la fréquence assignée (voir le numéro **154**);
2) *N'est pas une caractéristique fondamentale si la puissance apparente rayonnée ou la p. i. r. e. est notifiée dans la colonne 8.*

Colonne 9h Azimuts définissant les secteurs de rayonnement limité en degrés à partir du Nord vrai dans le sens les aiguilles d'une montre.

1) Indiquer les azimuts définissant les secteurs de rayonnement limité en degrés à partir du Nord vrai dans le sens des aiguilles d'une montre;
2) *Ce renseignement est une caractéristique fondamentale pour les stations de radiodiffusion fonctionnant dans les bandes d'ondes kilométriques et hectométriques dans la Région 1 et dans les bandes d'ondes hectométriques dans la Région 3.*

Colonne 9i Rayonnement maximal dans les secteurs.

1) Indiquer le rayonnement maximal admis dans le secteur, en dB, par rapport à une force cymo motrice (f. c. m.) de 300 V ou à une puissance apparente rayonnée sur une antenne verticale courte (p. a. r. v.) de 1 kW, déterminé d'après la puissance nominale de l'émetteur et le gain théorique de l'antenne, sans marge pour les diverses pertes;
2) *Ce renseignement est une caractéristique fondamentale pour les stations de radiodiffusion fonctionnant dans les bandes d'ondes kilométriques et hectométriques dans la Région 1 et dans les bandes hectométriques dans la Région 3.*

---

(1) Ce renseignement ne sera fourni avec une précision d'un dixième de dégre que si la station est située dans la zone de coordination d'une station terrienne ou si la direction du rayonnement maximal ne s'écarte pas de plus de trois degrés de l'órbite des satellites géostationnaires.

Colonne 9j Type d'antenne (voir le Manuel *Diagrammes d'antennes* du CCIR).

Indiquer la référence appropriée du Manuel *Diagrammes d'antennes* du CCIR. Voir les colonnes 9c et 9g ci-dessus.

Colonne 10 Horaire de fonctionnement.

Colonne 10a Horaire maximum (UTC) de fonctionnement de la liaison vers chaque localité ou zone.

1) Dans le cas où il s'agit d'une fréquence utilisée à la réception dans les circonstances spécifiés au numéro **1219** l'horaire maximum de fonctionnement à indiquer est celui des stations mobiles;
2) A titre de renseignement supplémentaire, indiquer par la lettre «I» les périodes pendant lesquelles le fonctionnement de la liaison est intermittent;
3) *N'est pas une caractéristique fondamentale.*

Colonne 10b Horaire normal (UTC) de fonctionnement de l'assignation de fréquence.

1) Indiquer, si on le connaît, l'horaire normal (UTC) de fonctionnement de l'assignation de fréquence. Si l'on ignore cet horaire, indiquer l'horaire de fonctionnement comme suit: service de jour (HJ), service de nuit (HN) ou service de transition (HT);
2) *Ce renseignement est une caractéristique fondamentale.*

Colonne 11 Coordination avec d'autres administrations.

1) Indiquer le pays ou la zone géographique avec lequel (ou laquelle) la coordination a été effectuée avec succès et indiquer la disposition qui requiert cette coordination (numéro du Règlement des radiocommunications, accord régional ou autre);
2) *Ce renseignement est une caractéristique fondamentale pour les bandes et les services concernés.*

Colonne 12a Administration ou compagnie exploitante (1).

Ce renseignement n'est pas une caractéristique fondamentale, mais il est recommandé de le fournir lorsqu'il s'agit d'une organisation qui exploite des stations dans plusieurs pays.

Colonne 12b Adresse postale et adresse télégraphique de l'administration dont relève la station (1).

1) Ces adresses sont celles auxquelles il convient d'envoyer toute communication urgente concernant les brouillages, la qualité des émissions et les questions relatives à l'exploitation technique de la liaison (voir l'article 22);
2) *Ce renseignement n'est pas une caractéristique fondamentale.*

Renseignements supplémentaires:

Tout renseignement supplémentaire fourni par l'administration doit figurer dans le cadre prévu à cet effet dans la fiche:

1) Si l'assignation est faite en exécution d'un accord régional ou de service, mentionner cet accord à l'emplacement approprié de la fiche; dans le cas contraire, inscrire l'indication «Nil»;
2) Indiquer à la suite du symbole «COORD» le nom de toute administration avec laquelle une coordination a été effectuée pour l'utilisation de la fréquence; si aucune coordination n'a lieu, inscrire l'indication «Nil». Dans le cas d'une notification aux termes des numéros **1223** à **1227** dans une bande de fréquences au-dessus de 28 000 kHz, indiquer, le cas échéant, la ou les zones dans lesquelles il a été convenu, à l'issue de la coordination, que la fréquence en question serait utilisée;
3) Indiquer la ou les fréquences de référence chaque fois qu'une émission déterminée en comporte, par exemple la fréquence de l'onde porteuse réduite d'une émission à bande latérale unique ou à bandes latérales indépendantes, ou les fréquences des ondes porteuses du son et de l'image d'une émission de télévision. En ce qui concerne les stations de télévision de la Région 1, chaque fiche de notification doit indiquer, à titre de renseignement supplémentaire, à la fois la fréquence de l'autre onde porteuse et la fréquence assignée;
4) Ajouter tout autre renseignement que l'administration juge pertinent, par exemple, l'indication que l'assignation en question sera utilisée conformément au numéro **342** du présent Règlement, ou bien des renseignements concernant l'utilisation de la fréquence notifiée, si cette utilisation est restreinte ou si la fréquence n'est pas utilisée pendant tout le temps où cela est possible d'après les conditions de propagation;
5) *Seuls les renseignements spécifiés au paragraphe 3 ci-dessus sont des caractéristiques fondamentales, mais il est recommandé de donner ceux dont il est question dans les paragraphes 1 et 2 ci-dessus. Cependent, dans les cas de des stations des services de radiocommunications de Terre dont il est question aux numéros **1148** à **1154**, le nom de toute administration auprès de laquelle une coordination a été recherchée en vue de l'utilisation de la fréquence et le nom de toute administration avec laquelle cette coordination a été effectuée sont des caractéristiques fondamentales.*

---

(1) Lorsque ces renseignements figurent déjà dans la Préface à la Liste internationale des fréquences, il convient d'utiliser le nombre ou la lettre de référence appropriés.

SECTION B

Instructions générales

1. Une fiche distincte doit être envoyée à l'IFRB pour notifier:

Chaque assignation de fréquence à mettre en service au cours d'une saison déterminée;
Toute modification aux caractéristiques d'une assignation de fréquence figurant dans l'Horaire de radiodiffusion à ondes décamétriques d'une saison;
Toute annulation d'une assignation de fréquence figurant dans l'Horaire de radiodiffusion à ondes décamétriques d'une saison.

2. Dans les collones *5a* et *8* à *11*, il convient d'inscrire séparément les caractéristiques lorsqu'elles ne sont pas valables pour la totalité de l'assignation, par exemple lorsque la puissance, les caractéristiques de l'antenne ou l'horaire de fonctionnement diffèrent selon les zones ou régions de réception.

I. Notes générales

a) Indiquer le nom de l'administration notificatrice.

b) Porter la lettre «X» dans cette case lorsque la fiche a trait à la première utilisation d'une fréquence par une station pendant une saison donnée.

c) Porter la lettre «X» dans cette case lorsque la fiche a trait à une modification aux caractéristiques d'une assignation de fréquence inscrite dans l'Horaire de radiodiffusion à ondes décamétriques d'une saison:

1) Au cas où des caractéristiques existants sont modifiées, il convient d'indiquer, à l'emplacement appropriée, les nouvelles caractéristiques, de les souligner et de menctionner au-dessous ou à côte, entre parenthèses, les caractéristiques originales qui sont modifiées;
2) Au cas où la modification consiste en une adjonction aux caractéristiques existantes, il convient d'indiquer, à l'emplacement appropriée, les caractéristiques ajoutées et de les souligner;
3) Au cas où la modification consiste en l'annulation d'une ou de plusieus caractéristiques, il convient d'indiquer ceci par un trait à l'emplacement approprié et de mentionner au-dessous ou à côte de ce trait, entre parenthèses, la ou les caractéristiques annulées.

d) Porter la lettre «X» dans cette case lorsque la fiche a trait à l'annulation, au cors de la saison, de la totalité des caractéristiques notifiées d'une assignation.

e) Le numéro de série de la fiche et la date de son envoi au Comité doivent être indiqués ici.

II. Notes concernant les renseignements à insérer dans les diverses colonnes de la fiche

Colonne 1 Fréquence.

Colonne 1a Indiquer la fréquence assignée en lHz, conformément à la définition figurant à l'article 1.

Colonne 1b Indiquer toute autre fréquence proposée, en kHz;

Colonne 1c ou bien la bande de fréquences désirée en MHz, si aucune fréquence n'est indiquée aux termes des paragraphes la et *1b* ci-dessus.

Colonne 2c Data de mise en service pendant la saison.

1) Si l'assignation est à mettre en service à la date de mise en application de l'horaire saisonnier, inscrire les deux derniers chiffres de l'année dans la ou les cases qui correspondent à la ou aux saisons pendant lesquelles l'assignation sera utilisée;
2) Si l'assignation est à mettre en service ou est modifiée à toute date autre que la date de mise en application de l'horaire saisonnier, cette date doit être inscrite à l'emplacement prévu à cet effet.

Colonne 3 Indicatif d'appel (signal d'identification).

Inscrire l'indicatif d'appel ou tout autre signal d'identification utillisé aux termes de l'article 25.

Colonne 4 Nom et remplacement de la station d'émission.

Colonne 4a Indiquer le nome de localité par lequel la station d'émission est designée ou dans laquelle elle est située.

Colonne 4b Indiquer le pays où la station est située. Il convient d'utiliser à cet effet les symboles figurant dans le Préface à la Liste internationale des fréquences.

Colonne 4c Indiquer les coordonnées géographiques (en degrés et minutes) de l'emplacement de l'émetteur.

Colonne 5a Zone(s) ou région(s) de réception.

1) Indiquer la ou les zones de réception telles qu'elles sont délimitées sur la carte annexé à l'appendice **1**;
2) Si la région de réception est moins étendue qu'une zone entière, il convient qu'elle corresponde à un pays ou à une partie d'un pays et qu'elle soit désignée, dans la mesure du possible, au moyen des symboles qui figurent dans la Préface à la Liste internationale des fréquences;
3) Indiquer à titre de renseignement supplémentaire la distance maximum de service en kilomètres, lorsque ce renseignement est tenu pour nécessaire.

Colonne 7 Classe d'émission et largeur de bande nécessaire.

Indiquer la classe d'émission et largeur de bande nécessaire, conformément à l'article 4 et à l'appendice **6.**

Colonne 8 Puissance (en kW).

Indiquer la puissance de l'onde porteuse fournie par l'émetteur à la ligne d'alimentation de l'antenne.

Caractéristiques de l'antenne d'émission:

Colonne 9a Azimut du rayonnement maximum.

1) Si l'on utilise une antenne d'émission à effet directif, indiquer l'azimut du rayonnement maximum de cette antenne, en degrés, à partie du Nord vrai dans le sens des aiguilles d'une montre;
2) Si l'on utilise une antenne d'émission sans effet directif, inscrire «ND» dans cette colonne.

Colonne 9b Angle d'ouverture du lobe principal de rayonnement.

Il convient d'indiquer l'angle total en projection sur le plan horizontal, en degrés, à l'intérieur duquel la puissance rayonnée dans une direction quelconque n'est pas inférieure de plus 6 dB à la puissance rayonnée dans la direction du rayonnement maximum.

Colonne 9c Gain de l'antenne (dB).

Il convient d'indiquer le gain relatif de l'antenne dans la direction du rayonnement maximum pour la fréquence assignée.

Colonne 9d Angle de site.

Il convient d'indiquer, en degrés, l'angle de la direction du rayonnement maximum avec le plan horizontal.

Colonne 9e Type d'antenne.

Utiliser, lorsque c'est possible, la nomenclature des *Diagrammes d'antenne* du CCIR. Les différentes types d'antenne sont énumérés à la fin des présentes instructions (voir la sous-section III de la présente section).

Colonne 10 Horaire de fonctionnement (UTC).

Colonne 11 Autres fréquences utilisées simultanément pour le même programme à destination de la ou des même(s) région(s).

1) Si la fréquence notifiée est la seule fréquence utilisée pour l'horaire en question, incrire «Nil» dans cette colonne;
2) Dans le cas contraire, indiquer les autres fréquences utilisée simultanément pour le même programme à destination de la même région.

Colonne 12b Adresse postale et adresse téléphonique de l'administration dont relève la station ([1]).

Ces adresses sont celles auxquelles il convient d'envoyer toute communication urgente concernant les brouillages, la qualité des émissions et les questions relatives à exploitation technique (voir l'article 22).

Renseignements supplémentaires:

Tout renseignement supplémentaire fourni par l'administration doit figurer dans le cadre prévu à cet effet dans la fiche:

1) Indiquer à la suite du symbole «COORD» le nom de toute administration avec laquelle une coordination a été effectuée pour l'utilisation de la fréquence; si aucune coordination n'a été effectuée, inscrire l'indication «Nil»;

([1]) Lorsque ces renseignements figurent déjà dans la Préface à la Liste internationale des fréquences, il convient d'utiliser le nombre ou la lettre de référence appropriés.

2) Ajouter tout autre renseignement que l'administration juge pertinent, par example la distance maximum de service, lorsque celle-ci est inférieure à 2000 kilomètres, ou des renseignements concernant l'utilisation de la fréquence notifiée, si cette utilisation est restreinte ou si la fréquence n'est pas utilisée pendant tout l'horaire indiqué dans la colonne *10*, ou n'est utilisée que certains jours de la semaine, ou si la technique de synchronisation est appliquée.

III. Symboles correspondant aux différents types d'antenne

HOR Antenne non directive horizontale.
VER Antenne non directive verticale.
DP Dipôle.
H Horizontal.
V Verticale.
R Avec réflecteur.

(Exemple: DPHR signifie: dipôle horizontal avec réflecteur.)

H Antenne-rideau en dipôles horizontaux.
R Avec réflecteur.
S Antenne décalée.
/.. Nombre d'elements demi-ondes par rangée horizontale.
/.. Nombre d'elements demi-onde par rangée verticale.
/.. Hauter au-dessus du sol de la rangée d'elements la plus basse (en longeurs d'onde.)
S.. Angle de décalage, le cas échéant.

(Exemple: HRS/4/3/2S15 signifie: système horizontal avec réflecteur, 4 rangées horizontales, 3 rangées verticales de dipôles, rangée horizontal inférieure située à 2 longueurs d'onde au-dessus du sol, décalage 15°.)

RHO Antenne en losange.
/.. Longueur du côte du losange (en longueurs d'onde).
/.. Hauteur du losange au-dessus du sol (en longueurs d'onde).
/.. Moitié de l'angle intérieur du losange.

(Exemple: RHO/2,5/0,4/65 signifie: antenne en losange, longueur d'un côté 2,5 longueurs d'onde, hauteur au-dessus du sol 0,4 longueur d'onde, demi-angle intérieur 65°.)

TRO Antenne pour la radiodiffusion dans la Zone tropicale.
/.. Nombre de rangées.
/.. Hauteur au-dessus du sol (en longueurs d'onde).

(Exemple: TRO/4/0,2 signifie: antenne pour la radiodiffusion tropicale à quatre rangées (et 4 dipôles par rangée) à une hauteur de 0,2 longueur d'onde au-dessus du sol.)

MOD **AP1A**

APPENDICE 3

Fiches de notification relatives aux stations de radiocomunications spatiale et de radioastronomie

(Voir les articles 11 et 13)

SECTION A

Instructions générales

1. Une fiche de notification distincte doit être envoyée au Comité international d'enregistrement des fréquences pour notifier:

Chaque nouvelle assignation de fréquence à une station terrienne, pour l'émission ou la réception, ou à une station spatiale, pour l'émission ou la réception;
Toute modification aux caractéristiques d'une assignation de fréquence inscrite dans le Fichier de référence international des fréquences, dénommé ci-après *Fichier de référence;*
Toute annulation totale d'une assignation de fréquence inscrite dans le Fichier de référence.

2. En ce qui concerne les assignations de fréquence aux stations terriennes et spatiales notifiées aux termes des numéros **1488** à **1491** selon qu'il s'agit de fréquences d'émission ou de réception, une fiche de notification distincte doit être présentée au Comité pour chaque assignation à une station terrienne ou spatiale. Dans chacun de ces cas, lorsque les caractéristiques fondamentales sont identiques, à l'exception de la fréquence, une seule fiche de notification peut être soumise, cette fiche

indiquant toutes les caractéristiques fondamentales et donnant la liste des fréquences assignées. Dans le cas d'une système à satellites réflecteurs, seules les assignations aux stations terriennes pour l'émission ou la réception doivent faire l'objet d'une notification.

3. Dans le cas d'un système à satellites comportant plusieurs stations spatiales de mêmes caractéristiques générales, une fiche distincte doit être présentée au Comité pour chaque station spatiale, pour les assignations de fréquences d'émission et de réception:

Si elle est placée à bord d'un satellite géostationnaire;

Si elle est placée à bord d'un satellite non géostationnaire, sauf si plusieurs satellites ont les mêmes caractéristiques aux fréquences radioélectriques et les mêmes caractéristiques d'orbite (à l'exclusion de la position du nœud ascendant); en pareil cas, une fiche unique valable pour toutes ces stations spatiales peut être présentée au Comité.

4. Chaque fiche de notification doit contenir les renseignements de base suivants:

a) Le numéro de série de la fiche et la date de son envoie au Comité;
b) Le nom de l'administration dont elle émane;
c) Des données suffisantes pour permettre d'identifier le réseau à satellite particulier dans lequel fonctionnera la station terrienne ou spatiale, y compris la position orbitale dans le cas d'un satellite géostationnaire;
d) L'indication de la fiche a trait:

1) À la première utilisation d'une fréquence par une station;
2) À une modification aux caractéristiques d'une assignation de fréquence inscrite dans le Fichier de réference (indiquer si cette modification consiste en un remplacement, une adjonction ou une annulation des caractéristiques existantes);
3) À l'annulation de la totalité des caractéristiques notifiées d'une assignation;

e) Une réference à la circulaire hebdomadaire de l'IFRB contenant la publication anticipée requise aux termes du numéro **1042;**
f) Les caractéristiques fondamentales définies dans les sections B, C, D, E ou F selon le cas;
g) Tout autre renseignement que l'administration juge pertinent, par exemple tout facteur pris en considération lors de l'application des dispositions de l'appendice **28** pour déterminer la zone de coordination, ainsi que l'indication éventuelle que l'assignation sera utilisée conformément au numéro **342**, des renseignements concernant l'utilisation de la fréquence notifiée dans le cas où cette utilisation est restreinte ou, lorsqu'il s'agit d'une fiche de notification relative à une station spatiale, si les émissions de celle-ci seront définitivement interrompues au terme d'une période déterminée.

SECTION B

Caractéristiques fondamentales à fournir dans la cas de la notification d'une fréquence d'émission d'une station terrienne

Point 1 Fréquence(s) assignée(s).

Indiquer la (les) fréquence(s) assignée(s) selon la définition de l'article 1 (voir le numéro **142**), en kHz jusqu'à 28 000 kHz inclus, en MHz au-dessus de 28 000 kHz jusqu'à 10 500 MHz inclus et en GHz au-dessus de 10 500 MHz.

Point 2 Bande de fréquences assignée.

Indiquer la largeur de la bande de fréquences assignée en kHz (voir le numéro **141**).

Point 3 Date de mise en service.

a) Dans le cas d'une nouvelle assignation, indiquer la date de mise en service effective ou prévue, selon le cas, de l'assignation de fréquence;
b) Lors d'une modification de l'une quelconque des caractéristiques fondamentales d'une assignation, telles qu'elles sont spécifiées dans la présente section, à l'exception de celle qui figure au *point 4, a)*, la date à indiquer doit être celle de la dernière modification effective ou prèvue, selon le cas.

Point 4 Identité et emplacement de la station terrienne d'émission.

a) Indiquer le nom sous lequel la station est désignée ou le nom de la localité dans laquelle elle est située;
b) Indiquer le pays ou la zone géographique où la station est située. Il, convient d'utiliser à cet effet les symboles figurant dans le Préface à la Liste internationale des fréquences;
c) Indiquer les coordonnées géographiques de l'emplacement de l'émetteur (longitude e latitude en degrés et minutes). Indiquer également les secondes ([1]) à un dixième de minute près.

([1]) Cette information n'est pas nécessaire que si la zone de coordination de la station terrienne empiète sur le territoire d'une autre administration.

Point 5 Station(s) avec laquelle (lesquelles) la communication doit être établie.

Indiquer l'identité de la (ou des) station(s) spatiale(s) de réception associée(s) à la station terrienne en se référant aux notifications y relatives ou de toute autre façon appropriée, ou bien, dans le cas d'un satellite réflecteur, l'identité du satellite et l'emplacement de la (ou des) station(s) terrienne(s) de réception qui lui sont associée(s). Dans le cas d'un satellite géostationaire, indiquer aussi sa position orbitale.

Point 6 Classe de la station et nature du service.

Au moyen des symboles figurant à l'appendice **10**, indiquer la classe de la station et la nature du service effectué.

Point 7 Classe d'émission, largeur de bande nécessaire et nature de la transmission.

Conformément à l'article 4 et à l'appendice **6:**

a) Indiquer la classe d'émission;
b) Indiquer la (ou les) fréquence(s) porteuse(s) de l'émission (1);
c) Indiquer, pour chaque porteuse, la classe d'émission, la largeur de bande nécessaire et la nature de la transmission (1);
d) Indiquer pour la porteuse ayant la plus petite largeur de bande des assignations du système, la classe d'émission, la largeur de bande nécessaire et la nature de la transmission (1).

Point 8 Caractéristiques de puissance de l'émission.

a) Indiquer, pour chaque porteuse, la puissance en crête (dBW) fournie à l'entrée de l'antenne (1);.
b) Indiquer la puisance totale en crête (dBW) et la densité maximale de puissance par Hz [dB (W/Hz)] (2) fournie à l'entrée de l'antenne (valeur moyenne calculée dans la bande de 4 kHz la plus défavorisée pour les porteuses inférieures à 15 GHz ou dans la bande de 1 MHz la plus défavorisée pour les porteuses supérieures à 15 GHz);
c) Indiquer, pour chaque porteuse, la valeur minimale de la puissance en crête fournie à l'entrée de l'antenne (1).

Point 9 Caractéristiques de l'antenne d'émission.

a) Indiquer le gain isotrope ou absolu (dB) de l'antenne dans la direction du rayonnement maximal (voir le numéro **154**);
b) Indiquer, en degrés, l'angle formé par les directions dans lesquelles la puissance est réduite de moitié (donner une description détaillée si le diagramme de rayonnement n'est pas symétrique);
c) Joindre à la fiche le diagramme de rayonnement de l'antenne mesuré en prenant la direction du rayonnement maximal comme référence, ou indiquer le diagramme de rayonnement de référence à utiliser pour la coordination;
d) Joindre à la fiche un schéma indiquant l'angle de site de l'horizon dans chaque azimut autour de la station terrienne;
e) Indiquer, en degrés, par rapport au plan horizontal, l'angle de site minimal, prévu en exploitation, de la direction du rayonnement maximal de l'antenne;
f) Indiquer, en degrés, à partir du Nord vrai dans le sens des aiguilles d'une montre, les limites entre lesquelles l'azimut de la direction du rayonnement maximal de l'antenne peut varier pendant l'exploitation;
g) Indiquer, le type de polarisation de l'onde émisse dans la direction du rayonnement maximal: indiquer aussi le sens de la polarisation dans le cas où elle est circulaire et le plan de la polarisation dans le cas où elle est linéaire (voir les numéros **148** et **149**) (1);
h) Indiquer l'altitude em mètres de l'antenne au-dessus du niveau moyen de la mer.

Point 10 Caractéristiques de modulation (1).

Pour chaque porteuse, selon la nature du signal modulant la porteuse et selon le type de modulation, indiquer les caractéristiques suivantes:

a) Porteuse modulée en fréquence par une bande de base téléphonique multivoies à repartition en fréquence (MRF/MF) ou par un signal pouvant être représenté par une bande de base téléphonique multivoies à répartition en fréquence: indiquer les fréquences inférieure et supérieure de la bande de base et l'excursion de fréquence efficace de la tonalité d'essai en fonction de la fréquence de la bande de base;

---

(1) Cette information n'est pas nécessaire qui si elle a servi comme base pour effectuer la coordination avec une autre administration.
(2) Il convient d'utiliser la plus récente version du Rapport 792 du CCIR dans la mesure où elle s'applique au calcul de la densité maximale de puissance par hertz.

b) Porteuse modulée en frequence par un signal de télévision: indiquer la norme du signal de télévision (y compris, s'il y a lieu, la norme utilisée pour la couleur), l'excursion de fréquence pour la fréquence pivot de la caractéristiques de préaccentuation et cette caractéristique de préaccentuation: indiquer également, s'il y a lieu, les caractéristiques de multiplexage du signal image avec le(s) son(s) ou d'autres signaux;

c) Porteuse modulée par déplacement de phase par un signal à modulation par impulsions et codage (MIC/MDP): indiquer le débit binaire et le nombre de phases;

d) Porteuse modulée en amplitude (y compris à bande latérale unique): indiquer de façon aussi précise que possible la nature du signal modulant et le type de modulation d'amplitude utilisé;

e) Pour tous les autres types de modulation, indiquer les renseignements qui peuvent être utiles pour une étude de brouillage;

f) Quel que soit le type de modulation utilisé, indiquer les caractéristiques de dispersion de l'énergie, telles que l'excursion crête à crête de fréquence (MHz) et la fréquence de balayage kHz de l'onde de dispersion.

Point 11 Horaire normal de fonctionnement.

Indiquer l'horaire normal de fonctionnement (UTC) sur la fréquence de chaque porteuse.

Point 12 Coordination.

Indiquer le nom de toute administration avec laquelle l'utilisation de la fréquence a été coordonnée avec succès, conformément aux numéros **1060** et **1107** et, le cas échéant, le nom de toute administration auprès de laquelle la coordination de l'utilisation de la fréquence a été recherchée, mais non effectuée.

Point 13 Accords.

Indiquer, s'il y a lieu, le nom de toute administration avec laquelle un accord a été conclu pour dépasser les limites prescrites dans le présent Règlement, ainsi que le contenu de cet accord.

Point 14 Administration ou compagnie exploitante.

Indiquer le nom de l'administration ou de la compagnie exploitante et les adresses postale et télégraphique de l'administration à laquelle il convient d'envoyer toute communication urgente concernant les brouillages, la qualité des émissions et les questions relatives à l'exploitation technique des stations (voir l'article 22).

SECTION C

Caractéristiques fondamentales à fournir dans le cas de la notification d'une fréquence de réception d'une station terrienne

Point 1 Fréquence(s) assignée(s).

Indiquer la (les) fréquence(s) assignée(s) de l'émission à recevoir selon la défintion de l'article 1 (voir le numéro **142**), en kHz jusqu'à 28 000 kHz, inclus, en MHz au-dessus de 28 kHz jusqu'à 10 500 MHz inclus et en GHz au-dessus de 10 500 MHz.

Point 2 Bande de fréquences assignée.

Indiquer la largeur de la bande de fréquences assignée en kHz (voir le numéro **141**).

Point 3 Date de mise en service.

a) Dans le cas d'une nouvelle assignation, indiquer la date effective ou prévue, selon le cas, à laquelle commence la récpetion sur la fréquence assignée;

b) Lors d'une modification de l'une quelconque des caractéristiques fondamentales d'une assignation, telles qu'elles sont spécifiées dans la présente section, à l'exception de celle qui figure au *point 4, a)*, la date à indiquer doit être celle de la dernière modification effective ou prévue, selon le cas.

Point 4 Identité et emplacement de la station terrienne de réception.

a) Indiquer le nom sous lequel la station terrienne de réception est désignée ou le nom de la localité dans laquelle elle est située;

b) Indiquer le pays ou la zoné géographique où la station terrienne de réception est située. Il convient d'utiliser à cet effet les symboles figurant dans la Préface à la Liste internationale des fréquences;

c) Indiquer les coordonnés géographiques de l'emplacement du récepteur (longitude et latitude en degrés et minutes). Indiquer également les secondes ([1]) à un dixième de minute près.

([1]) Cette information n'est pas nécessaire que si la zone de coordination de la station terrienne empiète sur le territoire d'une autre administration.

Point 5 Station(s) avec laquelle (lesquelles) la comunication doit être établie.

Indiquer l'identité de la (ou des) station(s) spatiale(s) d'émission associée(s) à la station terrienne, en se référant aux notifications y relatives ou de toute autre façon appropriée, ou bien, dans le cas d'un satellite réflecteur, l'identité du satellite et de la (ou des) station(s) terrienne(s) d'émission qui lui sont associée(s). Dans le cas d'un satellite géostationaire, indiquer aussi sa position orbitale.

Point 6 Classe de la station et nature du service.

Au moyen des symboles figurant à l'appendice **10**, indiquer la classe de la station et la nature du service effectuée.

Point 7 Classe d'émission, largeur de bande nécessaire et nature de la transmission à recevoir.

Conformément à l'article 4 et l'appendice **6**:

a) Indiquer la classe d'émission de la transmission à recevoir;
b) Indiquer la (ou les) fréquence(s) porteuse(s) de la transmission à recevoir (1);
c) Indiquer, pour chaque fréquence porteuse à recevoir, la classe d'émission, la largeur de bande nécessaire et la nature de la transmission (1).

Point 8 Caractéristiques de l'antenne de réception de la station terrienne.

a) Indiquer le gain isotrope ou absolu (dB) de l'antenne dans la direction du rayonnement maximal (voir le numéro **154**);
b) Indiquer, en degrés, l'angle formé par les directions dans lesquelles la puissance est réduite de moitié (donner une description détaillée si le diagramme de rayonnement n'est pas symétrique);
c) Joindre à la fiche de diagramme de rayonnement de l'antenne mesuré en prenant la direction du rayonnement maximal comme référence, ou indiquer le diagramme de rayonnement de référence à utiliser pour la coordination;
d) Joindre à la fiche un schéma indiquant l'angle de site de l'horizon dans chaque azimut autour de la station terrienne;
e) Indiquer, en degrés, par rapport au plan horizontal l'angle de site minimal, prévu en exploitation, de la direction du rayonnement maximal de l'antenne;
f) Indiquer, en degrés, à partir du Nord vrai dans le sens des aiguilles d'une montre, les limites entre lesquelles l'azimut de la direction du rayonnement maximal de l'antenne peut varier pendant l'exploitation;
g) Indiquer l'altitude en mètres de l'antenne au-dessus du niveau moyen de la mer;
h) Indiquer le type de polarisation de l'antenne. Dans le cas de la polarisation circulaire, en indiquer le sens (voir les numéros **148** e **149**). Dans le cas de la polarisation rectiligne, indiquer le plan de polarisation. Indiquer également si l'autorisation est donnée pour l'utilisation générale de ce renseignement en vue de déterminer la nécessité de la coordination avec d'autres réseaux à satellite conformément à l'appendice **29** (1).

Point 9 Température de bruit, température de bruit de la liaison et gain de transmission.

a) Indiquer, en kelvins, la plus faible température de bruit du système de réception total, rapportée à la sortie de l'antenne de réception de la station terrienne, dans les conditions de «ciel calme». Cette valeur est à indiquer pour la valeur nominale de l'angle de site dans le cas où la station d'émission associée est placée à bord d'un géostationnaire et, dans les autres cas, pour la valeur minimale de l'angle de site;
b) Lorsque de simples répéteurs-changeurs de fréquence sont utilisés à bord de la station spatiale associée, indiquer les plus faibles températures de bruit équivalents de la liaison par satellite dans les conditions du *point 9, a)*, ci-dessus pour chaque assignation (voir le numéro **168**);
c) Indiquer la valeur du gain de transmission associé à chaque température de bruit équivalent de la liaison par satellite donnée au *point 9, b)*, ci-dessus. Le gain de transmissions s'évalue de la sortie de l'antenne de réception de la station spatiale à la sortie de l'antenne de réception de la station terrienne.

Point 10 Horaire normal de réception.

Indiquer en tempos UTC l'horaire normal de réception sur la fréquence de chaque porteuse.

Point 11 Coordination.

Indiquer le nom de toute administration avec laquelle l'utilisation de la frequence a été coordonnée avec succès, conformément aux numéros **1060** et **1107** et, le cas échéant, le nom de toute administration auprès de laquelle la coordination de l'utilisation de la fréquence a été recherchée, mais non effectuée.

---

(1) Cette information n'est pas nécessaire que si elle a servi comme base pour effectuer la coordination avec une autre administration.

Point 12 Accords.

Indiquer, s'il y a lieu, le nom de toute administration avec laquelle un accord a été conclu pour dépasser les limites prescrites dans le présent Règlement, ainsi que le contenu de cet accord.

Point 13 Administration ou compagnie exploitante.

Indiquer le nom de l'administration ou de la compagnie exploitante et les adresses postale et télégraphique de l'administration à laquelle il convient d'envoyer toute communication urgente concernant les brouillages et les questions relatives à l'exploitation technique des stations (voir l'article 22).

SECTION D

Caractéristiques fondamentales à fournir dans le cas de la notification d'une fréquence d'émission de stations spatiales

Point 1 Fréquence(s) assignée(s).

Indiquer la (ou les) fréquence(s) assignée(s), selon la définition de l'article 1 (voir le numéro **142**), en kHz jusqu'à 28 000 kHz, inclus, en MHz, au dessus de 28 000 kHz jusqu'à 10 500 MHz inclus et en GHz au-dessus de 10 500 MHz. Il convient que chaque faisceau de rayonnement d'antenne fasse l'objet d'au moins une fiche de notification distincte.

Point 2 Bande de fréquences assignée.

Indiquer la largeur de la bande de fréquences assignée, en kHz (voir le numéro **141**).

Point 3 Date de mise en service ([1]).

a) Dans le cas d'une nouvelle assignation, indiquer la date de mise en service effective ou prévue, selon le cas, de l'assignation de fréquence;

b) Lors d'une modification de l'une quelconque des caractéristiques fondamentales d'une assignation, telles qu'elles sont spécifiées dans la présente section, à l'exception de celle qui figure au *point 4*, la date à indiquer doit être celle de la dernière modification effective ou prévue, selon le cas.

Point 4 Identité de la (ou des) station(s) spatiale(s).

Indiquer l'identité de la (ou des) station(s) spatiale(s).

Point 5 Renseignements relatifs à l'orbite.

a) Dans le cas d'une station spatiale placée à bord d'un satellite géostationnaire, indiquer la longitude géographique nominale sur l'orbite des satellites géostationnaires, ainsi que la tolérance de longitude et l'excursion d'inclinaison prévues. Indiquer également, dans le cas où il est prévu qu'un satellite géostationnaire communique avec une station terrienne:

1) L'arc de l'orbite des satellites géostationnaires sur lequel la station spatiale est visible sous un angle de site d'au moins 10° à partir des stations terriennes ou zones de service qui lui sont associées;
2) L'arc de l'orbitre des satellites géostationnaires le long duquel la station spatiale pourrait assurer le service requis avec les stations terriennes ou zones de service qui lui sont associées;
3) Si l'arc dont il est question à l'alinéa 2) ci-dessus est plus petit que celui dont il est question à l'alinéa 1) précédent, donner les raisons de cette différence.

Note. — Les arcs dont il est question aux alinéas 1) et 2) sont à définir par la longitude géographique de leurs extrémités sur l'orbitre des satellites géostationnaires.

b) Dans le cas d'une ou plusieurs stations spatiales placées à bord d'un ou de plusieurs satellites non géostationnaires, indiquer l'inclinaison de l'orbite, la période et les altitudes (en kilomètres) de l'apogée et du périgée de la (ou des) station(s) spatiale(s) ainsi que le nombre de satellites utilisées.

Point 6 Zone(s) de service ou station(s) de réception.

a) Dans le cas où les stations de réception associées sont des stations terriennes, indiquer la (ou les) zone(s) de service prévue(s) sur la Terre ou le nom de la localité et du pays ou la zone géographique où est située chaque station de réception;

([1]) Voir aussi la Résolution **4**.

b) Dans le cas où des stations de réception associeées sont des stations spatiales, indiquer l'identité de chacune d'elles en se référent aux notificatins y relatives ou de toute autre façon appropriée.

Point 7 Classe de station et nature du service.

Au moyen des symboles figurent à l'appendice **10**, indiquer la classe de la (ou des) station(s) et la nature du service effectué.

Point 8 Classe d'émission, largeur de bande nécessaire et nature de la transmission.

Conformément à l'article 4 et à l'appendice **6**:

a) Indiquer la classe d'émission de la transmission;
b) Indiquer la (ou les) fréquences(s) porteuses(s) de la transmission (1);
c) Indiquer, pour chaque porteuse, la classe d'émission, la largeur de bande nécessaire et la nature de la transmission (1);
d) Indiquer, pour la porteuse avant la plus petite largeur de bande de assignations du système, la classe d'émission, la largeur de bande nécessaire et la nature de transmission (1).

Point 9 Caractéristiques de puissance de l'émission.

a) Indiquer pour chaque porteuse la puissance en crête (dBW) fournie à l'entrée de l'antenne (1);
b) Indiquer la puissance totale en crête (dBW) et la densité maximale de puissance par Hz [dB (W/Hz)] (2) fournie à l'entrée de l'antenne (valeur moyenne calculée dans la bande de 4 kHz la plus défavorisée pour les porteuses inférieures à 15 GHz ou dans la bande de 1 MHz la plus défavorisée pour les porteuses supérieures à 15 GHz);
c) Indiquer, pour chaque porteuse, la valeur minimale de la puissance en crête fournie à l'entrée de l'antenne (1).

Point 10 Caractéristiques de l'antenne d'émission de la station spatiale.

Pour chaque zone de service, ou chaque faisceau de rayonnement de l'antenne:

a) Dans le cas d'une station spatiale placée à bord d'un satellite géostationnaire, destinée à communication avec une station terrienne, indiquer le gain maximal de l'antenne d'émission de la station spatiale et les contours de gain tracés sur une carte de la surface terrestre, de préférence dans une porjection radiale à partir du satellite et sur un plan perpendiculaire à l'axe joignant le centre de la Terre au satellite. Indiquer le gain isotrope ou absolut sur chaque contour correspondant à un gain inférieur de 2, 4, 6 10, 20 dB à la valeur maximale, et ainsi de suite de 10 dB en 10 dB si nécessaire. Chaque fois que possible, les contours du gain de l'antenne d'émission de la station spatiale devraient également être indiqués sour forme d'une équation numérique ou sous forme d'un tableau;
b) Dans le cas d'une station spatiale placée à bord d'un satellite géostationnaire dont le faisceau de rayonnement de l'antenne est dirigé vers un autre satellite ou dans le cas d'une station spatiale placée à bord d'un satellite non géostationnaire, indiquer le gain isotrope ou absolu de l'antenne d'émission de la station spatiale dans la direction de rayonnement maximal et le diagramme de rayonnement de cette antenne, en prenant pour réference le gain dans la direction de rayonnement maximal;
c) Indiquer le type de polarisation du rayonnement émis par l'antenne. Dans le cas d'une polarisation circulaire, indiquer le sens de la polarisation (voir les numéros **148** et **149**). Dans le cas d'une polarisation rectiligne, indiquer l'angle, en degrées, mesuré dans le sens inverse des arguilles d'une montre, dans le plan normal à l'axe du faisceau du plan équatorial au vecteur électrique de l'onde vu du satellite (1);
d) Dans le cas d'un satellite géostationnaire, indiquer la précision de pointage de l'antenne;
e) Dans le cas d'une station spatiale installée à bord d'un satellite géostationnaire fonctionnant dans une bande attribuée dans le sens Terre vers espace et dans le sens espace vers Terre, indiquer aussi le gain de l'antenne de la station spatiale d'émission dans la direction des parties de l'orbite des satellites géostationnaires qui ne sont pas occultées par la Terre, au moyen d'un diagramme indiquant le gain d'antenne estimé, en fonction de la longitude orbitale.

Point 11 Caractéristiques de modulation (1).

Pour chaque fréquence porteuse, selon la nature du signal modulant la porteuse et selon le type de modulation, indiquer les caractéristiques suivantes:

a) Porteuse modulée en fréquence par une bande de base téléphonique multivoie à répartition en fréquence (MRF/MF) ou par un signal pouvant être représenté par une bande de base

(1) Cette information n'est nécessaire qui si elle a servi comme base pour effectuer la coordination avec une autre administration.
(2) Il convient d'utiliser la plus récent version du Rapport 792 du CCIR dans la mesure où elle s'applique au calcul de la densité maximale de puissance par hertz.

téléphonique multivoie à répartition en fréquence: indiquer les fréquences inférieure et supérieure de la bande de base et l'excursion de fréquence efficace de la tonalité d'essai en fonction de la fréquence de la bande de base;

b) Porteuse modulée en fréquence par un signal de télévision: indiquer la norme du signal de télévision (y compris, s'il y a lieu, la norme utilisée pour la couleur), l'excursion de fréquence pour la fréquence pivot de la caractéristique de préaccentuation et cette caractéristique de préaccentuation: indiquer également, s'il y a lieu, les caractéristiques de multiplexage du signal image avec le(s) son(s) ou d'autres signaux;

c) Porteuse modulée par déplacement de phase par un signal à modulation par impulsions et codage (MIC/MDP): indiquer le débit binaire et le nombre de phases;

d) Porteuse modulée en amplitude (y compris à bande latérale unique): indiquer de façon aussi précise que possible la nature du signal modulant et le type de modulation d'amplitude utilisé;

e) Pour tous les autres types de modulation: indiquer les renseignements qui pouvant être utiles pour une étude de brouillage;

f) Quel que soit le type de modulation utilisé: indiquer, s'il y a lieu, les caractéristiques de dispersion de l'énergie.

Point 12 Horaire normal de fonctionnement.

Indiquer l'horaire normal (UTC) de foncionnement sur la fréquence de chaque porteuse.

Point 13 Coordination.

Indiquer le nom de toute administration ou groupe d'administrations avec lequel l'utilisation du réseau à satellite auquel appartient la station spatiale a été coordonnée avec succès, conformément au numéro **1060.**

Point 14 Accords.

Indiquer, s'il y a lieu, le nom de toute administration avec laquelle un acord a été conclu pour dépasser les limites prescrites dans le présent Règlement, ainsi que le contenu de cet accord.

Point 15 Administration ou compagnie exploitante.

Indiquer le nom de l'administration ou de la compagnie exploitante et les adresses postale et télégraphique de l'administration à laquelle il convient d'envoyer toute communication urgente concernant les brouillages, la qualité des émissions et les questions relatives à exploitation technique des stations (voir l'article 22).

SECTION E

Caractéristiques fondamentales à fournir dans le cas de la notification d'une fréquence de réception de stations spatiales

Point 1 Fréquence(s) assignée(s).

Indiquer la (ou les) fréquence(s), selon la définition de l'article 1 (voir le numéro **142**), en kHz jusqu'a 28 000 kHz inclus, en MHz au-dessus de 28 000 kHz jusqu'à 10 500 MHz, inclus et en GHz au-dessus de 10 500 MHz. Il convient que chaque faisceau de rayonnement d'antenne fasse l'objet d'au moins une fiche de notification distincte.

Point 2 Bande de fréquences assignée.

Indiquer la largeur de la bande de fréquences assignée, en kHz (voir le numéro **141**).

Point 3 Date de mise en service (1).

a) Dans le cas d'une nouvelle assignation, indiquer la date effective ou prévue, selon le cas, à laquelle commence la réception sur la fréquence assignée;

b) Lors d'une modification de l'une quelconque des caractéristiques fondamentales d'une assignation, telles qu'elles sont spécifiées dans la présente section, à exception de celle qui figure au *point 4*, la date à indiquer doit être celle de la dernière modification effective ou prévue, selon le cas.

Point 4 Identité de la (ou des) station(s) spatiale(s) de réception.

Indiquer l'identité de la (ou des) station(s) spatiale(s) de réception.

---

(1) Voir aussi la Résolution **4.**

Point 5 Renseignements relatifs à l'orbite.

a) Dans le cas d'une station spatiale placée à bord d'un satellite géostationnaire, indiquer la longitude géographique nominale sur l'orbite des satellites géostationnaires, ainsi que la tolérance de longitude et l'excursion d'inclinaison prévues. Indiquer également, dans le cas où il est prévu qu'un satellite géostationnaire communique avec une station terrienne:

1) L'arc de l'orbite des satellites géostationnaires sur lequel la station spatiale est visible sous un angle de site d'au moins 10° à partir des stations terriennes ou zones de service qui lui sont associées;
2) L'arc de l'orbite de satellites géostationnaires le long duquel la station spatiale pourrait assurer le service requis avec les stations terriennes ou zones de service qui lui sont associées;
3) Si l'arc dont il est question à alinéa 2) ci-dessus et plus petit que celui dont il est question à l'alinéa 1) précédent, donner les raisons de cette différence.

Note. — Les arcs dont il est question aux alinéas 1) et 2) sont à définir par la longitude géographique de leurs extrémités sur l'orbitre des satellites géostationnaires.

b) Dans le cas d'une ou de plusiers stations spatiales placées à bord d'un ou de plusieurs satellites non géostationnaires, indiquer l'inclinaison de l'orbite, la période et les altitudes (en kilomètres) de l'apogée et du périgée de la (ou des) stations(s) spatiale(s) ainsi que le nombre des satellites utilisés:

Point 6 Station(s) terrienne(s) ou spatiales(s) d'émission associée(s).

Indiquer l'identité de la (ou des) station(s) terriennes(s) ou spatiale(s) d'émission associée(s) à la (ou aux) station(s) spatiale(s), en se référent aux notifications y relatives ou de toute autre façon appropriée.

Point 7 Classe de station et nature du service.

Au moyen des symboles figurant à l'appendice **10,** indiquer la classe de la (ou des) stations(s) et la nature du service effectué.

Point 8 Classe d'émission, largeur de bande nécessaire et nature de la (ou des) transmissions à recevoir.

Conformément à l'article 4 et à l'appendice **6**:

a) Indiquer la classe d'émission de (ou des) transmission(s) à recevoir;
b) Indiquer la (ou les) fréquence(s) porteuse(s) de la (ou des) transmissions(s) à recevoir (1);
c) Indiquer, pour chaque fréquence portuese à recevoir, la classe d'émisson, la largeur de bande nécessaire et la nature de la (ou des) transmission(s) à recevoir (1).

Point 9 Caractéristiques de l'antenne de réception de la station spatiale.

Pour chaque faisceau d'antenne de réception:

a) Dans le cas d'une station spatiale placée à bord d'un satellite géostacionnaire destiné à communiquer avec une station terrienne, indiquer le gain maximal de l'antenne de récepption de la station spatiale et les contours de gain tracés sur une carte de la surface terrestre, de préférence dans une projection radiale à partir du satellite et sur un plan perpendiculaire à l'axe joignante le centre de la Terre au satellite. Indiquer le gain isotrope ou absolu sur chaque contour correspondant à un gain inférieur de 2, 4, 6, 10, 20 dB à la valeur maximale, et ainsi de 10 dB en 10 dB si nécessaire. Chaque fois que possible, les contours de gain de l'antenne de réception de la station spatialle devranit ègalement être indiqués sous forme d'une èquation numérique ou sous forme s'un tableau;
b) Dans la cas d'une station spatiale placée à bord d'un satéllite géostationnaire dont le faisceau de rayonnement de l'antenne est dirigé vers un autre satellite ou dans le cas d'une station spatialle placée à bord d'un satellite non géostationaire, indiquer le gain isotrope ou absolu de l'antenne de réception de la sation spatiale dans la direction de rayonnement maximal et le diagramme de rayonnment de cette antenne, en prenant pour référence le gain dans la direction de rayonnement maximal;
c) Indiquer le type de polarisation de l'antenne. Dans le cas de la polarisation circulaire, en indiquer le sens (voir les numéros **148** et **149**). Dans le cas de la polarisation rectiligne, indiquer l'angle, en degrés, mesuré dans le sens inverse des aiguilles d'une montre dans un plan normal à l'axe du faisceau du plan équatorial au vecteur électrique de l'onde vu du satellite. Indiquer également si l'autorisation a été donnée pour l'utilisation générale de ce renseignemente en vue de déterminer la nécessité de la coordination avec d'autres réseaux à satellite conformément à l'appendice **29** (1);

(1) Cette information n'est nécessaire que sil elle a servi conune base pour effectuer la coordination avec une autre administration.

d) Dans de cas d'un satellite géostionnaire, indiquer la précision de pointage de l'antenne;
e) Dans le cas d'une station spatialle installée à bord d'un satellite géostationnaire fonctionnant dans une band attribuée dans le sens Terre vers espace et dans le sens espace vers Terre, indiquer aussi le gain dę l'antenne de la station spatiale de réception dans la direction des parties de l'orbite des satellites géostacionnaires qui ne sont pas occultées par la Terre, au moyen d'un diagramme indiquant le gain d'antenne estimé, en fonction de la longitude orbitale.

Point 10 Température de bruit.

Indiquer, en kelvins, la température de bruit de l'ensemble du système de réception à la sortie de l'antenne de réception de la sation spatiale.

Point 11 Horaire normal de réception.

Indiquer en temps UTC l'horaire normal de réception sur la fréquence de chaques porteuse.

Point 12 Coordination.

Indiquer le nom de toute adiministration ou groupe d'administrations avec lequel l'utilisation du réseau à satellite auquel appartient la station spatiale a été coordonnée avec succès, conformément au numéro **1060.**

Point 13 Accords.

Indiquer, s'il y a lieu, le nom de toute administration avec laquelle un accord a été conclu pour dèpasser les limites prescrites dans le présent Règlement, ainsi que le contenu de cet accord.

Point 14 Administration ou compagnie exploitante.

Indiquer le nom de l'administration ou de la compagnie exploitante et les adresses postale et télegraphique de l'administration à laquelle il convient d'envoyer toute communication urgente concernant les brouillages et les questions relatives à l'exploitation technique des stations (voir l'article 22).

SECTION F

Caractéristiques fondamentales à fournir dans le cas de la notification d'une fréquence de réception de sation de radioastronomie

Point 1 Fréquence observée.

Indiquer, le centre de la bande de fréquences observée, en kHz jusqu'à 28 000 kHz inclus, en MHz au-dessus de 28 000 kHz inclus, en Mhz au-dessus de 28 000 kHz jusqu'à 10 500 MHz inclus et en GHz au-dessus de 10 500 MHz.

Point 2 Date de mise en service.

a) Indiquer la date effective ou prévue, selom le cas, à laquelle commence la rèception dans la bande de fréquences;
b) Lors d'une modification de l'une quelconque des caractéristiques fondamentales spécifiées dans la présent section, à l'exception de celle qui figure au *point 3, b*), la date à indiquer doit être celle de la dernière modification effective ou prévue, selon le cas.

Point 3 Nom et emplacement de la station.

a) Indiquer les lettres «RA»;
b) Indiquer le nom sous lequel la station est désignée ou le nom de la localité dans laquelle elle est située, ou bien ces deux noms;
c) Indiquer le pays ou la zone géographique où la station est située. Il convient d'utiliser à cet effet les symboles figurant dans la Préface à la Liste internationale des fréquences;
d) Indiquer les coordonnées géographiques, de l'emplancement de la station (longitude et latitude en degrés et minutes).

Point 4 Largues de bande.

Indiquer la largeur de la bande de fréquences (en kHz) sur laquelle portent les observations.

Point 5 Caractéristiques de l'antenne.

Indiquer le type et les dimensions de l'antenne, sa surface effective et les limites entre lesquelles peuvent varier son azimut et son angle de site.

Point 6 Horaire normal de réception.

Indiquer l'horaire normal (UTC) de réception sur la fréquence observée.

Point 7 Température de bruit.

Indiquer, en kelvins, la temperature de bruit de l'ensemble du système de réception, rapportée à la sortie de l'antenne de réception.

Point 8 Classe des observations.

Indiquer la classe des observations effectuées dans la bande de fréquences indiquée au *point 4*. Les observations de la classe A sont celles dans lesquelles la sensibilité des appareils n'est pas un facteur essentiel. Les observations de la classe B sont celles que l'on ne peut effectuer qu'avec des récepteurs à faible bruit très perfectionnés.

Point 9 Administration ou compagnie exploitante.

Indiquer le nom de l'administration ou de la compagnie expoitante et les adresses postale et télegraphique de l'administration à laquelle il convient d'envoyer toute communication urgente concernant les brouillages et les questions relatives à l'exploitation technique des stations (voir l'article 22).

SECTION G

Modèles de fiche de notification (station terrienne)

Le Comité établit et tient à jour des modéles de fiche de notification de manière à respecter la totalité des dispositions réglementaires du présent appendice et les décisions connexes des conférences futures.

SECTION H

Modèles de fiche de notification (station spatiale)

Le Comité établit et tient à jour des modèles de fiche de notification de manière à respecter la totalité des dispositions réglementaires du présent appendice et les décisions connexes des conférences futures.

ANNEXE À L'APPENDICE 3

Renseignements minimum nécessaires à la coordination régie par les dispositions des numéros 1060 et 1107

Renseignements géneraux:

a) Pour la coordination régie par les dispositions du numéro **1060**:

Dans le cas de la coordination de l'utilisation d'une ou plusieurs assignations de fréquence à une station spatiale, les renseignements à fournir au titre de la section B ou C de l'appendice **3** sont, soit les caractéristiques de la station terrienne réelle associée du réseau, si ces caractéristiques sont connues, soit les caractéristiques d'une station terrienne type;

Dans le cas de la coordination de l'utilisation d'une ou plusieurs assignations de fréquence à une station terrienne, les renseignements visés aux p*oints 4, c*), et *4, e*), de la section A de l'appendice **3** sont fournis si aucune modification n'a été apportée aux caractéristiques fondamentales de l'assignation, ou des assignations, à la station spatiale pour tenir compte des besoins de la station terriene (ou des stations terriennes). Dans les autres cas, la coordination de l'assignation (des assignations) de fréquence à la station spatiale est nécessaire.

b) Pour la coordination régie par les dispositions du numéro **1107**, seuls les renseignements indiqués dans les colonnes 9 et 10 du tableau joint sont nécessaires;

c) Un «X» dans une colonne du tableau indique que le renseignement en question est nécessaire.

Reinseignements requis au tire de l'appendice 3 — Type de coordination requise

Titres des colonnes

1 — Assignations à une station terrienne d'émission dotée d'un simple répéteurchangeur de fréquence à bord du satelite, conforme aux dispositions du numéro **1060.**

2 — Comme en 1, dans les cas nécessitant un traitement séparé de la liaison montante et de la liaison descendante (par exemple télémesure, télécommande).

3 — Assignations à une station terrienne de réception dotée d'un simple répéteurchangeur de fréquence à bord du satelite, conforme aux dispositions du numéro **1060.**

4 — Comme en 3, dans les cas nécessitant un traitement séparé de la liaison montante et de la liaison descendante (par exemple télémesure, télécommande).

5 — Assignations à une station spatiale d'émission dotée d'un simple répéteurchangeur de fréquences à bord du satelite, conforme aux dispositions du numéro **1060.**

6 — Comme en 5, dans les cas nécessitant un traitement séparé de la liaison montante et de la liaison descendante (par exemple télémesure, télécommande).

7 — Assignations à une station spatiale de réception dotée d'un simple répéteur-changeur de fréquence à bord du satélite, conforme aux dispositions du numéro **1060.**

8 — Comme en 7, dans les cas nécessitant un traitement séparé de la liaison montante et de la liaison descendante (par exemple télémesure, télécommande).

9 — Assignations à une station terrienne d'émission, conforme aux dispositions du numéro **1107.**

10 — Assignations à une station terrienne de réception, conforme aux dispositions du numéro **1107.**

APPENDICE 4

MOD AP1B **Renseignements à fournir pour la publication anticipée relative à un réseau à satellite**

(Voir l'article 11)

SECTION A

Instructions générales

Point 1 Les renseignements sont fournis séparément pour chaque réseau à satellite.

Point 2 Les renseignements à founir pour chaque réseau à satellite comprennent les caractéristiques pour générales (section B) et, selon le cas, les caractéristiques le sens «Terre vers espace» (section C), les caractéristiques pour le sens «espace vers Terre» (section D), et les caractéristiques pour les liasions espace-espace (section E). De plus, l'administration ou une administration agissant au nom d'un groupe d'administrations, nommémemt désignées, fournissant les rensignements pour la publication anticipée pourra fournir, à titre de resneignements supplémentaires, des donnés relatives au calcul des brouillages aux fins de la coordination entre réseaux (section F).

SECTION B

Caractéristiques générales à fournir pour un réseuau à satellite

Point 1 Identité du réseau à satellite.

Indiquer l'indentité du réseau à satellite au moyen de renseignements suffisants pour éviter toute ambiguité et, le cas échéant, l'identité du système à satellites dont il consiturera un élément.

Point 2 Date de mise en service ([1]).

Indiquer la date prévue pour la première mise en service du réseau à satellite.

Point 3 Administration ou groupe d'administration fournissant les rensseignements pour la publication anticipée.

Indiquer le nom de l'administration (ou les noms des administrations) du groupe fournissant les renseignements relatifs au réseau à satellite aux fins de leur publication antiipée, ainsi que les adresses postale et télegraphique de la (ou des) administration(s) à laquelle (auxquelles) il convient d'envoyer toute communication.

Point 4 Renseignements relatifs à l'orbite de la (ou des) station(s) spatiale(s).

a) Dans le cas d'une station spatiale placée à bord d'un satellite géostationnaire, indiquer la longitude géographique nominale sur l'orbite des satellites géostacionnaires ainsi que la tolérance de longitude et l'excursion d'inclinaison prévues, indiquer également:

1) L'arc de l'orbite des satellites géostationnaires sur lequel la station spatiale est visible sous un angle de site s'au moins 10° à partir des stations terriennes ou zones de service qui lui sont associées;
2) L'arc de l'orbite des satellites géostationnaires le long duquel la station spatiale pourrait assurer le service requis avec les stations terriennes ou zones de service qui lui sont associées;
3) Si l'arc dont il est question à l'alinéa 2) ci-dessus est plus petit que celui dont il est question à l'alinéa 1) précédent, donner les raisons de cette différence.

Note. — Les arcs dont il est question aux alinéas 1) et 2) sont à définer par la longitude géographique de leurs extrémités sur l'orbite des satellites géostationnaires.

b) Dans le cas d'une ou de plusieurs stations spatiales placées à bord d'un ou plusieurs satellites non géostationnaires, indiquer l'inclinaison de l'orbite, la période et les altitudes (en kilomètres) de l'apogée et du périgée de la (ou des) station(s) spatiale(s) ainsi que le nombre des satelites de mêmes caractéristiques utilisés.

([1]) Voir aussi Résolution **4.**

SECTION C

Caractéristiques du réseau à satellite pour le sens «Terre vers espace»

Point 1 Zone(s) de service «Terre vers espace».

Pour chaque antenne de réception de la station spatiale, indiquer la (ou des) zone(s) de service associée(s) sur la surface de la Terre.

Point 2 Classe des stations et nature du service.

Pour chaque zone de service «Terre vers espace», indiquer, au moyem des symboles figurant à l'appendice **10**, la classe des stations du réseau à satellite er la nature du service à effectuer.

Point 3 Gamme de fréquences.

Pour chaque zone de service «Terre vers espace», indiquer la gamme de fréquences dans laquelle les porteuses seront situées.

Point 4 Caractéristiques de puissance de l'onde émisse.

a) Pour chaque zone de service «Terre vers espace», indiquer la densité spectrale maximale de puissance [dB(W/Hz)](1) fournie à l'antenne des stations terriennes d'émission (la larguer de bande dans laquelle la moyenne est calculée dépend de la nature du servive dont il s'agit) pour chaque dimension d'antenne de station terrienne d'emission et, si elle est connue, la puissance en crête totale (dBW) et la largeur de bande nécessaire de cette émission;

b) Si ce renseignement est disponible, indquer pour chaque zone de service «Terre vers espace», en prenant pour référence le niveau isotrope, le diagramme de rayonnement réel de l'antenne de la station terrienne d'émission pour lequel la densité spectrale de puissance isotrope rayonnée équivalente en dehors du faisceau principal est la plus élevée pour chaque dimension l'antenne de station terrienne d'émission;

c) Si ce renseignement est disponible, indiquer, pour les proteuses de télévision et pour chaque zone de service «Terre vers espace», la puissance en crête fournie à l'entrée de l'entenne d'émission de la station terrienne;

d) Si ce renseignement est disponible, indiquer la valeur minimale de la puissance de la porteuse fournie à l'antenne de la station terrienne pour des porteuses à bande étroite.

Point 5 Caractéristiques des antennes de réception de la station spatiale.

Pour chaque zone de service «Terre vers espace»:

a) Dans le cas d'une station spatiale placée à bord d'un satellite géostationnaire, indiquer de gain maximal de l'antenne de réception de la station spatiale et les contours de ganin tracés sur une carte de la surface terrestre de préférence au moyen d'une projection radiale à partir du satellite sur un plan perpendiculaire à l'axe joignant le centre de la terre au satellite. Indiquer le gain isotrope ou absolu sur chaque contour correspondant à un gain inférieur de 2, 4, 6, 10, 20 dB à la valeur maximale et ainsi de suite de 10 dB, si nécessaire. Chaque fois que possible, les contours de gain estimés de l'antenne de réception de la station spatiale devraient également être indiqués sous forme d'une équation numérique ou sous forme d'un tableau;

b) Dans le cas s'une station spatiale placée à bord d'un satellite son géostationnaire, indiquer le gain isotrope ou absolu de l'antenne de réception de la station spatiale dans la direction de rayonnement maximal et le diagramme de rayonnement de cette antenne, en prenant pour référence le gain dans la direction de rayonnement maximal;

c) Si ce renseignement est disponible, indiquer, pour chaque antenne de réception de la station spatiale, de type de polarisation de l'antenne. Dans le cas d'une polarisation circulaire en indiquer le sens (voir les numéros **148** et **149**);

---

(1) Il convient d'utiliser la plus récent version du Rapport 702 du CCIR dans la mesure où elle s'apllique au calcul de la densité maximale de pussiance par hertz.

d) Dans le cas d'une station spatiale placée à bord d'un stallite géostationnaire fonctionnant dans une bande attribuée dans le direction «Terre vers espace» et dans la direction «espace vers Terre», indiquer également le gain estiné de l'antenne de réception de la station spatiale dans la direction des parties de l'orbite des satellites géostationnaires qui ne sont pas occultées par la Terre, au moyen d'un diagramme indiquant le gain d'antenne estimé par rapport à la longitude de l'orbite.

Point 6 Température de bruit de la station spatiale de réception.

Pour le chaque zone de service «Terre vers espace», indiquer, lorsqu'il n'est pas fait usage d'un simple répéteur-changeur de fréquence à bord de la station, la température de bruit la plus de l'ensemble du système de réception raportée à la sortie de l'antenne de réception.

Point 7 Larguer de bande nécessaire.

Si ce renseignement est disponible, indiquer, dans le cas de porteuses à bande étroite, larguer de bande nécessaire.

Point 8 Caractéristiques de modulation.

Si ce renseignement est disponible dans le cas de porteuses de télévision, indiquer les caractéristiques de dispersion de l'énergie telles que l'excursion crête à crête de fréquence (en MHz) et le fréquence de balayage (kHz) de l'onde de dispersion.

SECTION D

Caractéristiques du réseau à satellite dans le sens «espace vers Terre»

Point 1 Zone(s) de service «espace vers Terre».

Pour chaque antenne de émission de la station spatiale, indiquer la (ou les) zone(s) de service associée(s) sur la surface de la Terre.

Point 2 Classe des stations et nature du service.

Pour chaque zone de service «espace vers Terre», indiquer, au moyem des symboles figurant à l'appendice **10**, la classe des stations du réseau à satellite er la nature du service à effectuer.

Point 3 Gamme de fréquences.

Pour chaque zone de service «espace vers Terre», indiquer la gamme de fréquences dans laquelle les porteuses seront situées.

Point 4 Caractéristiques de puissance de l'émission.

a) Pour chaque zone de service «espace vers Terre», indiquer la densité spectrale maximale de puissance [dBN (W/Hz)] (1) fournie à l'antenne d'émission de la station spatiale (la largeur de bande dans laquelle la moyenne est calculée dépend de la nature du service dont il s'agit) et si elle sont connues, la puissance en crête totale (dBW) et la largeur de bande nécessaire de cette émission;

b) Si ce renseignement est disponible, indiquer, pour les porteuses à bande étroite et pour les porteuses de télévision, la puissance en crête fournie à l'entrée de l'antenne d'émission de la station spatiale;

c) Si ce renseignement est disponible, indiquer, la valeur minimale de la puissance de la porteuse fournie à l'antenne de la station spatiale, pour des porteuses à bande étroite.

Point 5 Caractéristiques des antennes d'émission de la station spatiale.

Pour chaque zone de service «espace vers Terre»:

a) Dans le cas d'une station spatiale placée à bord d'un satellite géostationnaire, indiquer le gain maximal de l'antenne d'émission de la station spatiale et les contours de gain tracés sur une

(1) Il convient d'utiliser la plus récente version du Rapport 792 du CCIR dans la mesure où elle s'applique au calcul de la densidé maximale de puissance par hertz.

carte de la surface terrestre, de préférence dans une projection radiale à partir du satellite sur un plan perpendiculaire à l'axe joignant le centre de la Terre au satellite. Indiquer le gain isotrope ou absolu sur chaque contour correspondant à un gain inférieur de 2, 4, 6, 10, 20 dB à la valeur maximale, et ainsi de suite de 10 dB en 10 dB, si nécessaire. Chaque fois que possible, les contours de gain estimés de l'antenne d'émission de la station spatiale devraient également être indiqués sous forme d'une équation numérique ou sous forme d'un tableau;

b) Dans le cas d'une station spatiale placée à bord d'un satellite géostationnaire, indiquer le gain isotrope ou absolu de l'antenne d'émission de la station spatiale dans la direction de rayonnement de cette antenne, en prenant pour référence le gain dans la direction de rayonnement maximal;

c) Si le renseignement est disponible, indiquer, pour chaque antenne d'émission de la station spatiale, le type de polarisation de l'antenne. Dans le cas d'une polarisation circulaire, en indiquer le sens (voir les numéros **148** et **149**);

d) Dans le cas d'une station spatiale placée à bord d'un satellite géostationnaire, fonctionnaire dans une bande attribuée dans le sens «Terre vers espace» et dans le sens «espace vers Terre», indiquer également de gain estimé de l'antenne d'émission de la station spatiale dans la direction des parties de l'orbite des satellites géostationnaires qui ne sont pas ocultées par la Terre, au moyen d'un diagramme montrant le gain d'antenne estimé, par rapport à la longitude de l'orbite.

Point 6 Caractéristiques de réception des stations terriennes.

a) Pour chaque zone de service «espace vers Terre», indiquer, lorsqu'il n'est pas fait usage d'un simple répéteur-changeur de fréquence à bord de la station spatiale, la température de bruit la plus basse de l'ensemble du système de réception des stations terriennes, rapportée à la sortie de l'antenne de réception.

Pour chaque zone de service «espace vers Terre» et pour chaque utilisation ([1]) projetée, indiquer, lorsqu'il est fait usage de simples répéteurs-changeurs de fréquence à bord de la station spatiale:

1) La plus faible température de bruit équivalente de liaison par satellite et la valeur associée du gain de transmission;

2) Les valeurs du gain de transmission et de la température de bruit équivalente de liaison associée, qui correspondent au rapport le plus élevé «gain de transmission/température de bruit équivalente de liaison par satellite»; le gain de transmission s'évalue de la sortie de l'antenne de réception de la station spatiale à la sortie de l'antenne de réception de la station terrienne. Pour chaque utilisation projetée, indiquer également à quelle(s) antenne(s) de réception de la station spatiale chaque simple répéteur-changeur de fréquence sera connecté;

b) Si ce renseignement est disponible, indiquer pour chaque zone de service «espace vers Terre», en prenant pour référence le niveau isotrope, le diagramme de rayonnement réel de l'antenne de la station terrienne de réception dont le niveau en dehors du faisceau principal est le plus élevé pour chaque dimension d'antenne de station terrienne de réception. Lorsqu'il est fait usage de simples répéteurs--changeurs de fréquence à bord de la station spatiale, indiquer également, si ce renseignement est disponible, le diagramme qui est associé à chacune des températures de bruit équivalentes de liaison par satellite indiqués ci-dessus.

Point 7 Largeur de bande nécessaire.

Si ce renseignement est disponible, indiquer, dans le cas de porteuses à bande étroite, la largeur de bande nécessaire.

Point 8 Caractéristiques de modulation.

Si ce renseignement est disponible, dans le cas de porteuses de télévision, indiquer les caractéristiques de dispersion de l'énergie telles qie l'excursion crête à crête de fréquence (MHz) et la fréquence de balayage (kHz) de l'onde de dispersion.

([1]) On considérera qu'il s'agit d'utilisations différentes lorsqu'il est fait usage de types différents de porteuse (par leur densité spectrale maximale de puissance) ou de types différents de stations terriennes de reception (par leur gain d'antenne de réception).

SECTION E

Caractéristiques à fournir pour les liaisons espace-espace

Si le réseau à satellite est relié à un ou plusieurs autres réseaux à satellite au moyen de liaisons espace-espace, indiquer:

a) L'identité du (ou des) réseau(x) à satellite auxquels le réseau à satellite considéré est relié;
b) Les bandes de fréquence d'émission et de réception;
c) Les classes d'émission;
d) Les puissances isotropes rayonnées équivalentes (p. i. r. e.) nominales dans l'axe des faisceaux d'antenne.

SECTION F

Renseignements supplémentaires (s'ils sont disponibles)

Point 1 Généralités.

Une administration ou une administration agissant au nom d'un groupe d'administrations nommément désignées qui le désire peut fournir des renseignements supplémentaires. Ces renseignements peuvent servir aux calculs de brouillage liés au processus de publication anticipée. Ils peuvent comprendre tout ou partie des données indiquées aux points suivantes, dont la liste n'est pas limitative, mais donnent une indication du type de renseignements qui peuvent être données.

Point 2 Sens «Terre vers espace».

Pour chaque zone de service «Terre vers espace», on peut fournir les renseignements suivants:

a) Classe d'émission, largeur de bande nécessaire et caractéristiques de modulation (y compris, s'il y a lieu, la dispersion de l'énergie) pour chaque type de porteuse émise;
b) P. i. r. e. de la station terrienne pour chaque type de porteuse associé à chaque type et diamètre d'antenne de station terrienne;
c) La description technique et les caractéristiques du système de télécommande (sauf pour les données de codage).

Point 3 Sens «espace vers Terre».

Pour chaque zone de service «espace vers Terre», on peut fournir les renseignements suivantes:

a) Classe d'émission, largeur de bande nécessaire et caractéristiques de modulation (y compris, s'il y a lieu, la dispersion de l'énergie) pour chaque type de porteuse;
b) Puissance d'émission du satellite fournie à l'antenne d'émission de ce satellite pour chaque type de porteuse;
c) La description technique et les caractéristiques du système d'émissions de poursuite et de télémesure (sauf pour les données de codage).

Point 4 Toute autre renseignement pouvant être utile.

NOC **AP1C**

APPENDICE 5

Renseignements à fournir conformément aux dispositions des numéros 1682 à 1684

(Voir l'article 16)

Allotissement initial	Allotissement additionel	Allotissement de remplacement (numéro 1721)

1. Pays ou zone d'allotissement ...

2.2.1. Fréquence proposée ..... { Fréquence porteuse... kHz / Fréquence assignée ... kHz

2.2. Autre fréquence proposée ..... { Fréquence porteuse... kHz / Fréquence assignée ... kHz

2.3. Fréquence à remplacer (numéro **1721**)..... { Fréquence porteuse... kHz / Fréquence assignée ... kHz

3.3.1. Zone de service principale ...
3.2. Longueur maximale de la liaison, en kilomètres ...
4. Nature du service (par exemple: CP, CO, CV ou OT) ...
5. Classe d'émission ...
6. Puissance de crête (en kW) ...
7. Caractéristiques de l'antenne d'émission (voir détails dans l'appendice 1):
7.1. S'il s'agit d'une antenne sans effet directif, inscrire le symbole «ND» ...
7.2. S'il s'agit d'une antenne à effet directif, indiquer:

a) L'azimut du rayonnement maximum ...
b) L'angle d'ouverture du lobe principal ...
c) Le gain relatif de l'antenne en dB ...

8. Horaire d'utilisation prévu de la fréquence proposée ... à ... h (UTC).
9. Indiquer si possible:

a) Les heures de point du trafic (estimation) ... à ... h (UTC).
b) Le volume journalier de trafic en minutes (estimation) ...

10. Date prévue pour la première utilisation de la voie ... (mois) ... (année).

MOD AP5

APPENDICE 6

Caractéristiques additionnelles pour la classification des émissions; détermination des largeurs de bande nécessaires, exemples de calcul de la largeur de bande nécessaire et exemples connexes de désignation des émissions

(Voir l'article 4)

PARTIE A

Caractéristiques additionnelles pour la classification des émissions

L'article 4 du présent Règlement décrit à l'aide de trois symboles les caractéristiques fondamentales pour la classification des émissions. Pour une description plus détaillée des émissions, il convient de recourir à deux caractéristiques additionnelles facultatives.

Ces caractéristiques additionnelles facultatives (voir aussi la Recommandation **62**) sont les suivantes:

Quatrième symbole — détails concernant le signal (ou les signaux);
Cinquième symbole — nature du multiplexage.

Si l'on n'utilise ni le quatrième ni le cinquième symbole, il convient de le mentionner par un trait placé à l'endroit où symbole devrait figurer.

1. *Quatrième symbole* — Détails concernant le signal (ou les signaux):

1. 1. Code bivalent, avec des éléments de signal qui diffèrent soit en nombre soit endurée ..... A
1. 2. Code bivalent, avec des éléments de signal identiques en nombre et en durée, sans correction d'erreur ..... B
1. 3. Code bivalent, avec des éléments de signal identiques en nombre et en durée, avec correction d'erreurs C

1. 4. Code quadrivalent, dans lequel chaque état représente un élément de signal (d'un ou plusieurs bits) ..... D
1. 5. Code plurivalent, dans lequel chaque état représente un élément de signal (d'un ou plusieurs bits) ..... E
1. 6. Code plurivalent, dans lequel chaque état ou combinaison d'états représente un caractère ..... F
1. 7. Son de qualité radiophonique (monophonique) ..... G
1. 8. Son de qualité radiophonique (stéréophonique ou quadriphonique) ..... H
1. 9. Son de qualité commerciale (à l'exclusion des catégories visées en 1.10 et 1.11) ..... J
1.10. Son de qualité commerciale avec emploi de l'inversion des fréquences ou du découpage de la bande .... K
1.11. Son de qualité commerciale, avec des signaux séparés modulés en fréquence pour commander le niveau di signal démodulé L
1.12. Image en noir et blanc ..... M
1.13. Image en couleur ..... N
1.14. Combinaison des cas ci-dessus ..... W
1.15. Autres cas X

2. *Cinquième symbole* — Nature du multiplexage:

2. 1. Pas de multiplexage ..... N
2. 2. Multiplexage par répartition du code (1) C
2. 3. Multiplexage par répartition en fréquence ..... F
2. 4. Multiplexage par répartition dans le temps ..... T
2. 5. Combinaison du multiplexage par répartition en fréquence et du multiplexage par répartition dans le temps W
2. 6. Autres types de multiplexage X

PARTIE B

Détermination des largeurs de bande nécessaires, exemples de calcul de la largeur de bande nécessaires et exemples connexes de désignation des émissions

Pour désigner complètement une émission, il faut ajouter, juste avant les symboles de classification, la largeur de bande nécessaire, indiquée par quatre caractères. Lorsqu'on l'utilise, la largeur de bande nécessaire doit être déterminée par l'une des méthodes suivantes:

1) Utilisation des formules contenues dans le tableau ci-après qui contient également des exemples de largeurs de bande nécessaires et de désignation des émissions correspondantes;
2) Calcul fondé sur les Avis du CCIR (2);
3) Mesure, dans les cas non prévus aux alinéas 1) et 2) ci-dessus.

Cependant, la largeur de bande nécessaire ainsi déterminée n'est pas la seule caractéristique d'une émission qu'il convient de prendre en considératiuon lorsqu'il s'agit d'évaluer le brouillage que cette émission est susceptible de causer.

Dans la rédaction du tableau, les notations qui suivent ont été utilisées:

B_n = largeur de bande nécessaire, en hertz;
B = rapidité de modulation, en bauds;
N = nombre maximal possible des éléments «noirs plus blancs» à transmettre par seconde dans le cas du fac-similé;
M = fréquence maximale de modulation, en hertz;
C = fréquence de la sous-porteuse, en hertz;
D = excursion de crête, c'est-à-dire la moitié de la différence entre les valeurs maximale et minimale de la fréquence instantanée. La fréquence instantanée en hertz s'obtient en divisant la vitesse de variation de la phase, en radians, par 2π;
t = durée de l'impulsion, en secondes, à mi-amplitude;
t_r = temps de montée de l'impulsion, en secondes, entre 10 % et 90 % d'amplitude;
K = facteur numérique général, qui varie suivant l'émission et qui dépend de la distorsion admissible du signal;
N_c = nombre de voies dans la bande de base dans les systèmes radioélectriques multiplex à plusieurs voies;
f_p = fréquence de la sous-porteuse pilote de continuité, en hertz (signal continu utilisé pour contrôler la qualité de fonctionnement des systèmes à multiplexage par répartition en fréquence).

(1) Comprend les techniques d'étalement de la largeur de bande.
(2) Voir également la Recommandation **63**.

Description de l'émission	Largeur de bande nécessaire		Désignation de l'émission
	Formule	Exemple de calcul	
I. Pas de signal modulant			
Onde entretenue pure.....	—	—	Non
II. Modulation d'amplitude			
1. Signal modulation de l'information quantifiée ou numérique			
Télégraphie à ondes entretenues, code Morse.	$B_n = BK$. $K = 5$ pour les liaisons affectées d'évanouissements. K = 3 pours les liaisons sans évanouissements.	25 mots par minute. $B = 20$, $K = 5$. Largeur de bande: 100 Hz	100HA1AAN
Télégraphie à manipulation par tout ou rien d'une porteuse modulée par une fréquence audible, code Morse.	$B_n = BK + 2M$. $K = 5$ pour les liaisons affectées d'évanouissements. $K = 3$ pour les liaisons sans évanouissements.	25 mots par minute. $B = 20$, $M = 1000$. $K = 5$. Largeur de bande: 2100 Hz = 2,1 kHz ...	2K10A2AAN
Signal d'appel sélectif avec emploi d'un code séquentiel à une seule fréquence, bande latérale unique, onde porteuse complète.	$B_n = M$.	Fréquence maximale du code: 2110 Hz. $M = 2110$. Largura de bande: 2110 Hz = 2,11 kHz	2K11H2BFN
Télégraphie à impression directe, avec emploi d'une sous-porteuse modulante à déplacement de frequence, correction des erreurs, bande latérale unique, onde porteuse supprimée (une seule voie).	$B_n = 2M + 2DK$. $M = \frac{B}{2}$.	$B = 50$. $D = 35$ Hz (déplacement 70 Hz). $K = 1,2$. Largura de bande: 134 Hz	134HJ2BCN
Télégraphie harmonique multivoie avec correction des erreurs, quelques voies sont multiplexées par répartion dans le temps, bande latérale unique, onde porteuse réduite.	B_n = fréquence centrale la plus élevée + $M + DK$. $M = \frac{B}{2}$.	15 voies, fréquence centrale la plus élevée = 2805 Hz. $B = 100$. $D = 42,5$ Hz (déplacement 85 Hz). $K = 0,7$. Largeur de bande: 2885 Hz = 2,885 kHz	2K89R7BCW
2. Téléphonie (qualité commerciale)			
Téléphonie, double bande latérale (une seule voie).	$B_n = 2M$.	$M = 3000$. Largeur de bande: 6000 Hz = 6 kHz.....	6K00A3EJN
Téléphonie, bande latérale unique, onde porteuse complète (une seule voie).	$B_n = M$.	$M = 3000$. Largeur de bande: 3000 Hz = 3 kHz....	3K00H3EJN
Téléphonie, bande latérale unique, onde porteuse supprimée (une seule voie).	$B_n = M$ — fréquence de modulation la plus basse.	$M = 3000$. Fréquence de modulation la plus basse = 300 Hz. Largeur de bande: 2700 Hz = 2,7 kHz ...	2K70J3EJN
Téléphonie avec signaux distincts modulés en fréquence pour régler le niveau du signal vocal démodulé, bande latérale unique, onde porteuse réduite. (Lincompex) (une seule voie).	$B_n = M$.	Fréquence maximale de réglage: 2990 Hz. $M = 2990$. Largeur de bande: 2990 Hz = 2,99 kHz	2K99R3ELN
Téléphonie avec dispositif de secret, bande latérale unique, onde porteuse supprimée (deux voies ou plus).	$B_n = N_c M$ — fréquence de modulation la plus basse dans la voie la plus basse.	$N_c = 2$. $M = 3000$, fréquence de modulation la plus basse: 250 Hz. Largeur de bande: 5750 Hz = 5,75 kHz	5K75J8EKF
Téléphonie, bande latérale indépendante (deux voies ou plus).	B_n = somme de M pour chaque bande latérale.	2 voies. $M = 3000$. Largeur de bande: 6000 Hz = 6 kHz....	6K00B8EJN

Description de l'emission	Largeur de bande nécessaire		Désignation de l'émission
	Formule	Exemple de calcul	
3. Radiodiffusion sonore			
Radiodiffusion sonore, double bande latérale.	$B_n = 2M$. M peut varier entre 4000 et 10 000, selon la qualité désirée.	Parole et musique, M = 4000. Largeur de bande: 8000 Hz = 8 kHz....	8K00A3EGN
Radiodiffusion sonore, bande latérale unique, onde porteuse réduite (une seule voie).	$B_n = M$. M peut varier entre 4000 et 10 000, selon la qualité désirée.	Parole et musique, M = 4000. Largeur de bande: 4000 Hz = 4 kHz...	4K00R3EGN
Radiodiffusion sonore, bande latérale unique, onde porteuse supprimée.	$B_n = M$ — fréquence de modulation la plus basse.	Parole et musique, M = 4500, fréquence de modulation la plus basse = 50 Hz. Largeur de bande: 4450 Hz = 4,45 kHz	4K45J3EGN
4. Télévision			
Télevision, image et son.	Pour les largeurs de bande communément utilisées pour les systèmes de télévision, voir les documents correspondants du CCIR.	Nombre de lignes: 625. Largeur de bande vidéo nominale: 5 MHz. Porteuse sonore par rapport à la porueuse: 5,5 MHz. Largeur de bande totale pour l'image: 6,25 MHz ..... Largeur de la voie de transmission sonore modulée en fréquence, y compris les bandes de garde: 750 kHz ..... Largeur de bande de la voie aux fréquences radioéletriques: 7 MHz.	6M25C3F — — 750KF3EGN
5. Fac-similé			
Fac-similé analogique par modulation en fréquence de la sous-porteuse d'une émission à bande latérale unique, onde portuese réduite, noir et blanc.	$B_n = C + \frac{N}{2} + DK$. K = 1,1. (Valeur type.)	N = 1100, correspondant à un module de coopération de 352 et à une vitesse de rotation du cylindre de 60 tours par minute. Le module de coopération est le produit du diamètre du cylindre et du nombre de lignes par unité de longueur. C = 1900, D = 400 Hz. Largeur de bande: 2890 Hz = 2,89 kHz	2H89R3CMN
Fac-similé analogique; modulation en fréquence d'une sous-porteuse audio-fréquence modulant la porteuse principale, bande latérale unique, onde porteuse supprimée.	$B_n = 2M + 2DK$. $M = \frac{N}{2}$. K = 1,1. (Valeur type.)	N = 1100. D = 400 Hz. Largeur de bande: 1980 Hz = 1,98 kHz	1K98J3C — —
6. Emissions composites			
Double bande latérale, faisceau hertzien de télévision.	$B_n = 2C + 2M + 2D$.	Fréquences vidéo limitées à 5 MHz, son sur sous-porteuse 6,5 MHz, modulée en fréquence avec excursion de 50 kHz: $C = 6{,}5 \times 10^6$; $D = 50 \times 10^3$ Hz; M = 15 000. Largeur de bande: $13{,}13 \times 10^6$ Hz = 13,13 MHz	13M1A8W — —
Double bande latérale, faisceau hertzien, multiplexage par répartition en fréquence.	$B_n = 2M$.	10 voies téléphoniques, occupant la bande de base 1-164 kHz. M = 164 000. Largeur de bande: 328 000 Hz = 328 kHz	328KA8E — —

Description de l'émission	Largeur de bande nécessaire		Désignation de l'émission
	Formule	Exemple de calcul	
Double bande latérale de VOR avec téléphonie (VOR = radiophare d'alignement équidirectif VHF).	$B_n = 2C_{max} + 2M + 2DK$. $K = 1$. (Valeur type.)	La porteuse principale est modulée par: Une sous-portuese de 30 Hz; Une porteuse résultant d'une tonalité de 9960 Hz modulée en fréquence par une tonalité de 30 Hz, Une voie téléphonique; Une tonalité de 1020 Hz manipulée pour identification continue en Morse. $C_{max} = 9960$. $M = 30$. $D = 480$ Hz. Largeur de bande: 20 940 Hz = 20,94 kHz	20K9A9WWF
Bandes latérales indépendantes; plusieurs voies télégraphiques avec correction d'erreurs, ainsi que plusieurs voies téléphoniques avec dispositif de secret; multiplexage par répartition en fréquence.	B_n = somme de M pour chaque bande latérale.	Normalement, les systèmes composites sont exploités conformément aux dispositions normalisées des voies (par exemple Avis 348-2 du CCIR). Pour 3 voies téléphoniques et 15 voies télégraphiques, la largeur de bande nécessaire est de 12 000 Hz = 12 kHz	12K0B9WWF

III-A. Modulation de fréquence

1. Sinal contenant de l'information quantifiée ou numérique

Télégraphie sans correction d'erreurs (une seule voie).	$B_n = 2M + 2DK$. $M = \frac{B}{2}$. $K = 1,2$. (Valeur type.)	$B = 100$. $D = 85$ Hz (déplacement 170 Hz). Largeur de bande: 304 Hz	304HF1BBN
Télégraphie à impression directe à bande étroite, avec correction d'erreurs (une seule voie).	$B_n = 2M + 2DK$. $M = \frac{B}{2}$. $K = 1,2$. (Valeur type.)	$B = 100$. $D = 85$ Hz (déplacement 170 Hz). Largeur de bande: 304 Hz	304HF1BCN
Signal d'appel sélectif.	$B_n = 2M + 2DK$. $M = \frac{B}{2}$. $K = 1,2$. (Valeur type.)	$B = 100$. $D = 85$ Hz (deslocamento 170 Hz). Largeur de bande: 304 Hz	304HF1BCN
Télégraphie duoplex à 4 fréquences.	$B_n = 2M + 2DK$. B = rapidité de modulation en bauds de la voie la plus rapide. Se les voies sont synchronisées: $M = \frac{B}{2}$ (autrement $M = 2B$). $K = 1,1$. (Valeur type.)	Espacement entre fréquences adjacentes = 400 Hz. Voies synchronisées: $B = 100$; $M = 50$; $D = 600$ Hz. Largeur de bande: 1420 Hz = 1,42 kHz	1K42F7BDX

2. Téléphonie (qualité commerciale)

Téléphonie commerciale.	$B_n = 2M + 2DK$. $K = 1$. (Valeur type mais, dans certaines conditions des valeurs plus grandes de K peuvent être nécessaires.)	Cas moyen de téléphonie commerciale, $D = 5000$ Hz. $M = 3000$. Largeur de bande: 16 000 Hz = 16 kHz.	16K0F3EJN

Description de l'émission	Largeur de bande nécessaire		Désignation de l'émission
	Formule	Exemple de calcul	
3. Radiodiffusion sonore			
Radiodiffusion sonore	$B_n = 2M + 2DK$. $K = 1$. (Valeur type.)	Monophonique. D = 75 000 Hz. M = 15 000. Largeur de bande: 180 000 Hz = 180 kHz	180KF3EGN
4. Fac-similé			
Fac-similé par modulation directe en fréquence de la porteuse; noir et blanc.	$B_n = 2M + 2DK$. $M = \frac{N}{2}$. K = 1,1. (Valeur type.)	N = 1100 élements par seconde; D = 400 Hz. Largeur de bande: 1980 Hz = 1,98 kHz	1K98F1C — —
Fac-similé analogique.	$B_n = 2M + 2DK$. $M = \frac{N}{2}$. K = 1,1. (Valeur type.)	N = 1100 élements par seconde; D = 400 Hz. Largeur de bande: 1980 Hz = 1,98 kHz	1K98F3C — —
5. Emissions composites (voir le taleau III-B)			
Faisceau hertzien, multiplexage par répartition en fréquence.	$B_n = 2f_p + 2DK$. $K = 1$. (Valeur type.)	60 voies téléphoniques occupant la bande de base 60-300 kHz; excursion efficace par voie: 200 kHz; la fréquence pilote de continuité (331 kHz) donne lieu à une excursion efficace de la porteuse principale 100 Hz. $D = 200 \times 10^3 \times 3,76 \times 2,02 = 1,52 \times 10^6$ Hz. $f_p = 0,331 \times 10^6$ Hz. Largeur de bande: $3,702 \times 10^6$ Hz = 3,702 MHz	3M70F8EJF
Faisceau hertzien, multiplexage par répartition en fréquence.	$B_n = 2M + 2DK$. $K = 1$. (Valeur type.)	960 voies téléphoniques occupant la bande de base 60-4028 kHz; excursion efficace par voie: 200 kHz; la fréquence pilote de continuité (4715 kHz) donne lieu à une excursion efficace de la porteuse principale de 140 kHz. $D = 200 \times 10^3 \times 3,76 \times 5,5 = 4,13 \times 10^6$ Hz. $M = 4,028 \times 10^6$. $f_p = 4,715 \times 10^6$: $(2M + 2DK) > 2 f_p$. Largeur de bande: $16,32 \times 10^6$ Hz = 16,32 MHz	16M3F8EJF
Faisceau hertzien, multiplexage par répartition en fréquence.	$B_n = 2f_p$.	600 voies téléphoniques occupant la bande de base 60-2540 kHz; excursion efficace par voie: 200 kHz; la fréquence pilote de continuité (8500 kHz) donne lieu à une excursion efficace de la porteuse principale de 140 kHz. $D = 200 \times 10^3 \times 3,76 \times 4,36 = 3,28 \times 10^6$ Hz. $M = 2,54 \times 10^6$. $K = 1$. $f_p = 8,5 \times 10^6$; $(2M + 2DK) < 2 f_p$. Largeur de bande: 17×10^6 Hz = 17 MHz	17M0F8EJF
Radiodiffusion sonore stéréophonique avec sous-porteuse subsidiaire de téléphonie multiplexée.	$B_n = 2M + 2DK$. $K = 1$. (Valeur type.)	Système à fréquence pilote. M = 75 000. D = 75 000 Hz. Largeur de bande: 300 000 Kz = 300 kHz	300KF8EHF

III-B. Facteurs de multiplication à utiliser pour calculer *D*, excursion de fréquence de crête, dans les émissions multivoies à modulation de fréquence et multiplexage par répartition en fréquence (MF/MRF)

Pour les systèmes MF/MRF, la largeur de bande nécessaire est:

$$B_n = 2M + 2DK$$

On calcule la valeur de *D*, ou excursion de fréquence de crête dans les formules pour B_n en multipliant la valeur efficace d'excursion par voie par le «facteur multiplicatif» approprié indiqué ci-dessous.

Dans le cas où une onde pilote continuité de fréquence f_p est présente au-dessus de la fréquence maximale de modulation *M*, la formule générale prende la forme suivante:

$$B_n = 2f_p + 2DK$$

Dans le cas où l'indice de modulation de la porteuse principale produit par l'onde pilote est inférieur à 0,25 et où la valeur efficace de l'excursion de fréquence de la porteuse principale produite par l'onde pilote est inférieure ou égale à 70 % de la valeur efficace de l'excursion por voie, la formule générale prend celle des deux formes ci-après qui donne la valeur la plus grande:

$$B_n = 2f_p \text{ ou } B_n = 2M + 2DK$$

Nombre de voies téléphoniques N_c	Facteur multiplicatif (*a*)
	(Facteur de crête) × antilog $\left[\frac{\text{Valeur en dB au-dessus du niveau de modulation de référence}}{20}\right]$
$3 < N_c < 12$	4,47 × antilog $\left[\frac{\text{Une valeur en dB spécifiée par le constructeur de l'equipement ou par l'esploitant de la station, sous réserve de l'approbation de l'administration}}{20}\right]$
$12 \leq N_c < 12$	3,76 × antilog $\left[\frac{2{,}6 + 2 \log N_c}{20}\right]$

(*a*) Dans ce tableau, les facteurs multiplicatifs 3,76 et 4,47 correspondent respectivement à des factures de crête de 11,5 dB et 13,0 dB.

Nombre de voies téléphoniques N_c	Facteur multiplicatif (*a*)
	(Facteur de crête) × antilog $\left[\frac{\text{Valeur en dB au-dessus du niveau de modulation de référence}}{20}\right]$
$60 \leq N_c < 240$	3,76 × antilog $\left[\frac{-1 + 4 \log N_c}{20}\right]$
$N_c \geq 240$	3,76 × antilog $\left[\frac{-15 + 10 \log N_c}{20}\right]$

(*a*) Dans ce tableau, le facteur multiplicatif 3,76 correspond à un facteur de crête de 11,5 dB.

Description de l'émission	Largeur de bande nécessaire		Désignation de l'émission
	Formule	Exemple de calcul	

IV. Modulation par impulsions

1. Radar

Emission d'impulsions non modulées.	$B_n = \frac{2K}{t}$. *K* dépend du rapport entre la durée de l'impulsion et le temps de montée de l'impulsion. Savaleur se situe généralement entre 1 et 10 et, dans de nombreux cas, sa valeur n'a pes besoin de dépasser 6.	Radar primaire. Pouvoir séparateur en distance: 150 m. $K = 1{,}5$ (impulsion triangulaire où $t = t_r$ seules les composantes les plus fortes jusqu'à 27 dB étant prises en considération). D'où $t = \frac{2 \text{ (pouvoir séparateur en distance)}}{\text{vitesse de la lumière}} = \frac{2 \times 150}{3 \times 10^8} = 1 \times 10^{-6}$ seconde. Largeur de bande: 3×10^6 Hz = 3 MHz	3M00P0NAN

Description de l'émission	Largeur de bande nécessaire		Désignation de l'émission
	Formule	Exemple de calcul	
2. Emissions composites			
Faisceau hertzien.	$B_n = \frac{2K}{t}$. $K = 1,6$.	Impulsions modulées en position par une bande de base de 36 voies téléphoniques. Durée de l'impulsion à mi-amplitude = 0,4, µs. Largeur de bande: 8×10^6 Hz = 8 MHz (Largeur de bande indépendante du nombre de voies téléphoniques.)	8M00M7EJT

MOD AP3

APPENDICE 7

Tableau des tolérances de fréquence des émetteurs

(Voir l'article 5)

§ 1. La tolérance de fréquence est définie à l'article 1, et sauf indication contraire, elle est exprimée em millionièmes.

§ 2. La puissance indiquée pour les diverses catégories de stations est, sauf indication contraire, la puissance en crête des émetteurs à bande latérale unique et la puissance moyenne pour tous les autres émetteurs. Le terme «puissance d'un émetteur redioélectrique» est défini à l'article 1.

§ 3. Pour des raisons techniques ou d'exploitation, certains catégories de stations peuvent nécessiter des tolérances plus strictes que celles spécifiées au tableau.

Bandes de fréquences (limite inférieure exclue, limite supérieure incluse) et catégories de stations	Tolérances applicables jusqu'au 1er janvier 1990 aux émetteurs actuellement en service et à ceux qui seront installés avant le 2 janvier 1985.	Tolérances applicables aux nouveaux émetteurs installés à partir du 1er janvier 1985 et à tous les émetteurs à partir du 1er janvier 1990.
1	2	3
Bande: **de 9 kHz a 535 kHz**		
1. *Stations fixes:*		
De 9 kHz à 50 kHz	1 000	100
De 50 kHz à 535 kHz	200	50
2. *Stations terrestres:*		
a) Stations côtières	-	(1) 100
D'une puissance inférieure ou égale a 200 W	(2) 500	-
D'une puissance supérieure à 200 W	(2) 200	-
b) Stations aéronautique	100	100
3. *Stations mobiles:*		
a) Stations de navire	(3) 1 000	(4) 200
b) Émetteurs de secours de navire	5 000	(5) 500
c) Stations d'engin de sauvetage	5 000	500
d) Sations d'aéronef	500	100
4. *Stations de radiorepérage*	100	100
5. *Stations de radiodiffusion*	10 Hz	10 Hz
Bande: **de 535 kHz à 1606,5 kHz (1605 kHz, Région 2)**		
Stations de radiodiffusion	(6) 10 Hz	(6) 10 Hz

Bandes de fréquences (limite inférieure exclue, limite supérieure incluse) et catégories de stations	Tolérances applicables jusqu'au 1er janvier 1990 aux émetteurs actuellement en service et à ceux qui seront installés avant le 2 janvier 1985.	Tolérances applicables aux nouveaux émetteurs installés à partir du 1er janvier 1985 et à tous les émetteurs à partir du 1er janvier 1990.
1	2	3
***Bande:* de 1606,5 kHz (1605 kHz, Région 2) à 4000 kHz**		
1. *Stations fixes:*		
D'une puissance inférieure ou égale à 200 W	100	(7) (8) 100
D'une puissance supérieure à 200 W	50	(7) (8) 50
2. *Stations terrestres:*		
D'une puissance inférieure ou égale à 200 W	(2) (9) (10) 100	(1) (7) (10) 100
D'une puissance supérieure à 200 W	(2) (9) (10) 50	(1) (7) (10) 50
3. *Sations mobiles:*		
a) Station de navire	(3) (11) 200	(12) 40 Hz
b) Station d'engin de sauvetage	300	100
c) Radiobalises de localisation des sinistres	300	100
d) Satation d'aéronef	(10) 100	(10) 100
e) Stations mobiles terrestres	200	(13) 50
4. *Stations de radiorepérage*:		
D'une puissance inférieure ou égale à 200 W	100	(14) 20
D'une puissance supérieure à 200 W	50	(14) 10
5. *Stations de radiodiffusion*	20	(15) 10 Hz
***Bande:* de 4 MHz à 29,7 MHz**		
1. *Stations fixes:*		
D'une puissance inférieure ou égale à 500 W	50	–
D'une puissance supérieure à 500 W	15	–
a) Émissions à bande latérale unique et à bande latérale indépendante:		
D'une puissance inférieure ou égale à 500 W	–	50 Hz
D'une puissance supérieure à 500 W	–	20 Hz
b) Émissions de classe FIB	–	10 Hz
c) Autres classes d'émission:		
D'une puissance inférieure ou égale à 500 W	–	20
D'une puissance supérieure à 500 W	–	10
2. *Stations terrestres:*		
a) Stations côtières	–	(1) (16) 20 Hz
D'une puissance inférieure ou égale à 500 W	(2) (9) 50	–
D'une puissance supérieure à 500 W et inférieure ou égale à 5 kW	(2) (9) 30	–
D'une puissance supérieure à 55 kW	(2) (9) 15	–
b) Stations aéronautiques:		
D'une puissance inférieure ou égale à 500 W	(10) 100	(10) 100
D'une puissance supérieure à 500 W	(10) 50	(10) 50
c) Stations de base	–	(7) 20
D'une puissance supérieure ou égale à 500 W	100	–
D'une puissance supérieure à 500 W	50	–
3. *Stations mobiles:*		
a) Stations de navire:		
1) Émissions de classe A1A	(17) (18) 50	10
2) Émissions de classe autre que A1A	(3) (11) 50	(4) (19) 50 Hz
b) Stations d'engin de sauvetage	200	50
c) Stations d'aéronef	(10) 100	(10) 100
d) Stations mobiles terrestres	200	(20) 40
4. *Stations de radiodiffusion*	15	(15) (21) 10 Hz
5. *Stations spatiales*	–	20
6. *Stations terriennes*	–	20

Bandes de fréquences (limite inférieure exclue, limite supérieure incluse) et catégories de stations	Tolérances applicables jusqu'au 1er janvier 1990 aux émetteurs actuellement en service et à ceux qui seront installés avant le 2 janvier 1985.	Tolérances applicables aux nouveaux émetteurs installés à partir du 1er janvier 1985 et à tous les émetteurs à partir du 1er janvier 1990.
1	2	3
Bande: **de 29,7 MHz à 100 MHz**		
1. *Stations fixes:*		
D'une puissance inférieure ou égale à 200 W	50	–
D'une puissance supérieure à 200 W	30	–
D'une puissance inférieure ou égale à 50 W	–	30
D'une puissance supérieure à 50 W	–	20
2. *Stations terrestres*	–	20
D'une puissance inférieure ou égale à 15 W	50	–
D'une puissance supérieure à 15 W	20	–
3. *Stations mobiles*	–	(22) 20
D'une puissance inférieure ou égale à 15 W	100	–
D'une puissance supérieure à 5 W	50	–
4. *Stations de radiorepérage*	200	50
5. *Stations de radiodiffusion (autres que de télévision)*	–	(23) 2 000 Hz
D'une puissance inférieure ou égale à 50 W	50	–
D'une puissance supérieure à 50 W	20	–
6. *Stations de radiodiffusion (télévision, son et image)*	–	(24) (25) 500 Hz
D'une puissance inférieure ou égale à 50 W	100	–
D'une puissance supérieure à 50 W	1 000 Hz	–
7. *Stations spatiales*	–	20
8. *Stations terriennes*	–	20
Bande: **de 100 MHz à 470 MHz**		
1. *Stations fixes:*		
D'une puissance inférieure ou égale à 50 W	50	(26) 20
D'une puissance supérieure à 50 W	20	10
2. *Stations terrestres:*		
a) Stations côtières	(27) 20	10
b) Stations aéronautiques	50	(28) 20
c) Station de base:		
D'une puissance inférieure ou égale à 5 W	50	–
D'une puissance supérieure à 5 W	20	–
Dans la bande 100-235 MHz	–	(29) 15
Dans la bande 235-401 MHz	–	(29) 7
Dans la bande 401-470 MHz	–	(29) 5
3. *Stations mobiles*	–	(22) 20
a) Stations de navire et stations d'engin de sauvetage:		
Dans la bande 156-174 MHz	(27) 20	10
En dehors de la bande 156-174 MHz	(30) (31) 50	(31) 50
b) Stations d'aéronef	50	(28) 30
c) Stations mobiles terrestres:		
D'une puissance inférieure ou égale à 5 W	50	–
D'une puissnace supérieure à 5 W	20	–
Dans la bande 100-235 MHz	–	(29) 15
Dans la bande 235-401 MHz	–	(29) (32) 7
Dans la bande 401-470 MHz	–	(29) (32) 5
4. *Stations de radiorepérage*	(30) (33) 50	(33) 50
5. *Stations de radiodiffusion (autres que de télévision)*	20	(23) 2 000 Hz
6. *Stations de radiodiffusion (télévision, son et image)*	–	(24) (25) 500 Hz
D'une puissance inférieure ou égale à 100 W	100	–
D'une puissance supérieure à 100 W	1 000 Hz	–
7. *Stations spatiales*	–	20
8. *Stations terriennes*	–	20

Bandes de fréquences (limite inférieure exclue, limite supérieure incluse) et catégories de stations	Tolérances applicables jusqu'au 1er janvier 1990 aux émetteurs actuellement en service et à ceux qui seront installés avant le 2 janvier 1985.	Tolérances applicables aux nouveaux émetteurs installés à partir du 1er janvier 1985 et à tous les émetteurs à partir du 1er janvier 1990.
1	2	3
Bande: **de 470 MHz à 2450 MHz**		
1. *Stations fixes:*		
D'une puissance inférieure ou égale à 100 W	(34) 300	100
D'une puissance supérieure à 100 W	(35) 100	50
2. *Stations terrestres*	300	(36) 20
3. *Stations mobiles*	300	(36) 20
4. *Stations de radiorepérage*	(33) 500	(33) 500
5. *Stations de radiodiffusion (autres que de télévision)*	100	100
6. *Stations de radiodiffusion (télévision, son et image)* dans la bande de 470 MHz à 960 MHz	–	(24) (25) 500 Hz
D'une puissance inférieure ou égale à 100 W	100	–
D'une puissance supérieure à 100 W	1 000 Hz	–
7. *Stations spatiales*	–	20
8. *Stations terriennes*	–	20
Bande: **de 2450 MHz à 10 500 MHz**		
1. *Stations fixes:*		
D'une puissance infèrieure ou égale à 100 W	(34) 300	200
D'une puissance supérieure à 100 W	(35) 100	50
2. *Stations terrestres*	300	100
3. *Stations mobiles*	300	100
4. *Stations de radiorepérage*	(33) 2 000	(33) 1 250
5. *Stations spatiales*	–	50
6. *Stations terriennes*	–	50
Bande: **de 10,5 GHz à 40 GHz**		
1. *Stations fixes*	500	300
2. *Stations de radiorepérage*	(33) 7 500	(33) 5 000
3. *Stations de radiodiffusion*	–	100
4. *Stations spatiales*	–	100
5. *Stations terriennes*	–	100

Renvois du tableau des tolérances de fréquence des émetteurs

SUP Renvois actuels de *a*) à *r*)

(1) Pour les émetteurs de station côtière utilisés pour la télégraphie à impression directe ou pour la transmission de données, la tolérance est de 15 Hz.

(2) Pour les émetteurs de station côtière utilisés pour la télégraphie à impression directe ou pour la transmission de données, la tolérance est de 15 Hz. Cette tolérance est apllicable aux appareils installés après le 1er janvier 1976, et à la totalité des appareils à partir du 1er janvier 1985. Pour les appareils installés avant le 2 janvier 1976, la tolérance est de 40 Hz.

(3) Pour les émetteurs de station de navire utilisés pour la télégraphie à impression directe ou pour la transmission de données, la tolérance est de 40 Hz. Cette tollérance est applicable aux appareils installés après le 1er janvier 1976 et à la totalité des appareils après de 1er janvier 1985. Pour les appareils installés ayant le 2 janvier 1976, cette tolérance est de 100 Hz (avec une dérive maximale de 40 Hz pour de courtes périodes de l'ordre de quinze minutes).

(4) Pour les émetteurs de stations de navire utilisés pour la télégraphie à impression directe ou pour la transmission de données, la tolérance est de 40 Hz.

(5) Si l'émetteur de secours sert d'émetteur de réserve pour remplacer au besoin l'émetteur principal, la tolérance prévue pour les émetteurs des stations de navire est applicable.

(6) Dans les pays ou l'Accord régional de radiodiffusion de l'Amérique du Nord (NARBA) est em vigueur, on pourra continuer d'appliquer la tolérance de 20 Hz.

(7) Pour les émetteurs de radiotéléphonie à bande latérale unique, la tolérance est:

Dans les bandes 1606,5 (1605 Région 2)-4000 kHz et 4-29,7 MHz, pour des puissances en crête de 200 W ou moins respectivement: 50 Hz;

Dans les bandes 1606,5 (1605 Région 2)-4000 kHz et 4-29,7 MHz, pour des puissances en crête supérieurs à 200 W respectivement: 20 Hz.

(8) Pour les émetteurs de radiotélégraphie avec manipulation par déplacement de fréquence, la tolérance est de 10 Hz.

(9) Pour les émetteurs des stations côtières radiotéléphoniques à bande latérale unique, la tolérance est de 20 Hz.

(10) Pour les émetteurs à bande latérale unique fonctionnant dans les bandes attribuées en exclusivité au service mobile aéronautique (R) entre 1606,5 kHz (1605 kHz Région 2) et 4000 kHz et entre 4 Mhz et 29,7 MHz, la tolérance sur la fréquence porteuse (fréquence de référence) est:

a) Pour toutes les stations aéronautiques, 10 Hz;
b) Pour toutes les stations d'aéronef fonctionnant dans les services internationaux, 20 Hz;
c) Pour les stations d'aéronef fonctionnant exclusivement dans des services nationaux, 50 Hz (*).

(11) Pour les émetteurs des stations radiotéléphoniques de navire à bande latérale unique, la tolérance est:

a) Dans les bandes comprises entre 1606,5 kHz (1605 kHz Région 2) et 4000 kHz:

100 Hz por les émetteurs en service ou installés avant le 2 janvier 1982;
50 Hz pour les émetteurs installés après le 1er janvier 1982, mais avant le 1er janvier 1985;

b) Dans les bandes comprises entre 4000 kHz et 23 000 kHz:

100 Hz pour les émetteurs en service installés avant de 2 janvier 1978;
50 Hz pour les émetteurs installés aprés le 1er janvier 1978. (Voir également l'appendice 17.)

(12) Pour les émissions de classe A1A, la tolérance est de 50 millionièmes.

(13) Pour les émetteurs utilisés en radiotéléphonie à bande latérale unique ou en radiotélégraphie avec manipulation par déplacement de fréquence, la tolérance est de 40 Hz.

(14) Pour les émetteurs de radiobalise dans la bande 1606,5 (1605 Région 2)-1800 kHz, la tolérance est de 50 millionièmes.

(15) Pour les émissions de classe A3E, d'une puissance de porteuse inférieure ou égale à 10 kW, fonctionnant dans les bandes 1606,5 (1605 Région 2)-4000 kHz et 4-29,7 MHz, la tolérance est respectivement de 20 millionièmes et de 15 millionièmes.

(16) Pour les émissions de classe A1A, la tolérance est de 10 millionièmes.

(17) Dans les bandes de fréquences de travail en télégraphie Morse de classe A1A, une tolérance de fréquence de 200 millionièmes peut être appliquée aux émetteurs existants sous réserve que les émissions restent à l'intérieur de ces bandes.

(18) Dans les bandes de fréquences de d'appel en télégraphie Morse de classe A1A, des tolérances de fréquence de 40 millionièmes dans les bandes comprises entre 4 MHz et 23 MHz, et de 30 millionièmes dans la bande des 25 MHz sont recommandées dans tout la mesure du possible.

(19) Pour les émetteurs de stations de navire de faible tonnage d'une puissance de porteuse inférieure ou égale à 5 W fonctionnant dans les eaux côtières ou dans leur voisinage et utilisant des émissions de classe A3E ou F3E et G3E dans la bande 26 175-27 500 kHz la tolérance est de 40 millionièmes.

(20) La tolérance est de 50 Hz pour les émetteurs de radiotéléphonie à bande latérale unique, sauf pour les émetteurs fonctionnant dans la bande 26 175-27 500 kHz dont la puissance en crête ne dépasse pas 15 W; pour ces derniers, la tolérance de base applicable est de 40 millionièmes.

(21) Il est suggéré que les administrations évitent des différences de fréquence porteuse de l'ordre de quelques hertz, qui causent des dégradations analogues à celles des évanouissements périodiques. Il convient pour ce faire, que la tolérance de fréquence soit de 0,1 Hz; cette tolérance conviendrait également pour les émissions à bande latérale unique.

(22) Pour des équipements portatifs qui ne sont pas montés sur des véhicules, et dont la puissance moyenne d'émission ne dépasse pas 5 W, la tolérance est de 40 millionièmes.

(23) Pour les émetteurs d'une puissance moyenne inférieure ou égale à 50 W fonctionnant sur des fréquences inférieures à 108 MHz, une tolérance de 3000 Hz est applicable.

(24) Dans le cas de stations de radiodiffusion (télévision):

D'une puissance en crête d'image inférieure ou égale à 50 W dans la bande 29,7-100 Mhz;
D'une puissance en crête d'image inférieure ou égale à 100 W dans la bande 100-960 Mhz,

et qui recoivent leurs émissions d'autres stations de télévision ou qui desservent de petites localités isolées, il peut être impossible, pour des raisons d'exploitation, de respecter cette tolérance. Pour ces stations, la tolérance est de 2000 Hz. Pour des stations d'une puissance en crête d'image inférieure ou égale à 1 W, cette tolérance peut être assouplie à:

5 kHz dans la bande 100-470 MHz;
10 kHz dans la bande 470-960 MHz.

(25) Pour les émetteurs utilisant le système M (NTSC), la tolérance est de 1000 Hz. Toutefois, pour les émetteurs de faible puissance utilisance ce système, la note (24) est apllicable.

(26) Pour les systèmes de faisceaux hertziens à plusieurs bonds qui emploient la conversion directe de fréquence, la tolérance est de 30 millionièmes.

(27) Pour les émetteurs de station côtière et de station de navire fonctionnant dans la bande 156-174 MHz et mis en service après le 1er janvier 1973, la tolérance de fréquence est de 10 millionièmes. Cette tolérance est applicable à tous les émetteurs, y compris ceux des stations d'engins de sauvetage, à partir de 1er janvier 1983.

(28) Pour un espacement entre voies de 50 kHz, la tolérance est de 50 millionièmes.

(29) Ces tolérances sont applicables pour des espacements entre voies égaux ou supérieurs à 20 kHz.

(30) Cette tolérance n'est pas applicable aux stations d'engin de sauvetage fonctionnant sur la fréquence 243 MHz.

(31) Pour les émetteurs utilisés par les stations de communications de bord, la tolérance de fréquence est de 5 millionièmes.

(32) Pour les équipements portatifs non installés sur véhicules dont la puissance moyenne d'émission ne dépasse pas 5 W, la tolérance est de 15 millionièmes.

(33) Lorsqu'il n'est pas assigné de fréquences déterminées aux stations de radar la largeur de bande occupée par leurs émissions doit être maintenue tout entière à l'intérieur de la bande attribuée à ce service et la tolérance mentionnée ne leur est pas applicable.

(34) Pour les émetteurs utilisant le multiplexage par répartition dans le temps, la tolérance de 300 millionièmes peut être portée à 500 millionièmes.

(35) Cette tolérance s'applique uniquement aux émissions dont la largeur de bande necessaire est au plus égale à 3000 kHz; pour les émissions dont la largeur de bande est supérieure à 3000 kHz, la tolérance est portée à 300 millionièmes.

(36) En appliquant cette tolérance, il convient que les administrations se réfèrent aux Avis pertinents les plus récents du CCIR.

(*) Afin d'obtenir une intellegibillité maximale, il'est suggéré aux administrations d'encourager la réduction de cette tolérance à 20 Hz.

MOD AP4

APPENDICE 8

Tableau des niveaux de puissance maximaux tolérés des rayonnements non essentiels

(Voir l'article 5)

1. Le tableau suivant indique les niveaux maximaux tolérés des rayonnements non essentiels, en terme de niveau de puissance moyenne de toute composante non essencielle fournie par un émetteur à la ligne d'allimentation de l'antenne.

2. Aucun rayonnement non essentiel provenant d'une partie de l'installation autre que l'antenne et sa ligne d'alimentation ne doit avoir un effet plus grand que celui qui se produirait si ce système rayonnant était alimenté à la puissance maximum tolérée sur la fréquence de ce rayonnement non essentiel.

3. Toutefois, ces niveaux ne s'appliquent pas aux radiobalises de localisation des sinistres, aux émetteurs de localisation d'urgence, aux émetteurs de secours de navire, aux émetteurs de canot de sauvetage, aux stations d'engin de sauvetage ni aux émetteurs de navire lorsqu'ils sont employés en cas de sinistre.

4. Pour des raisons techniques ou d'exploitation, certains services peuvent avoir besoin de niveux plus strics que ceux spécifiés dans le tableau. Les niveaux applicables à ces services doivent être ceux qui ont été adoptés par la conférence administrative mondiale des radiocommunications compétente. Les niveaux plus stricts peuvent être également fixés par accord spécifique entre les administrations concernées.

5. Dans le cas des stations de radiorepérage, tant que l'on ne dispose pas de méthodes de mesure acceptables, il convient que la puissance des rayonnements non essentiels soit aussi faible que pratiquement possible.

Bande de fréquences dans laquelle l'assignation est située (limite inférieure exclue, limite supérieure incluse)	Pour toute composante non essentielle, l'affaiblissement (puissance moyenne à l'intérieur de la largeur de bande nécessaire par rapport à la puissance moyenne de la composante non essentielle considérée) doit avoir au moins la valeur spécifiée dans les colonnes A et B ci-dessous et les niveaux absolus de puissance moyenne donnés ne doivent pas être dépassés [Note (1)].	
	A	B
	Niveaux applicables jusqu'au 1er janvier 1994 aux émetteurs actuellement en service et à ceux qui seront installés avant le 2 janvier 1985.	Niveaux applicables à tout émetteur installé à partir du 1er janvier 1985 et à touts émetteurs à partir du 1er janvier 1994.
9 kHz à 30 MHz	40 dB 50 mW [Notes (2), (3), (4)]	40 dB 50 mW [Notes (4), (7), (8)]
30 MHz à 235 MHz:		
Puissance moyenne supérieure à 25 W	60 dB 1 mW [Note (5)]	60 dB 1 mW [Note 9)]
Puissance moyenne égale ou inférieure à 25 W	40 dB 25 µW [Notes (5), (6)]	40 dB 25 µW
235 MHz à 960 MHz:		
Puissance moyenne supérieure à 25 W		60 dB 20 mW [Notes (10), (11)]
Puissance moyenne égale ou inférieure à 25 W		40 dB 25 µW [Notes (10), (11)]
960 MHz à 17,7 GHz:		
Puissance moyenne supérieure à 10 W		50 dB 100 mW [Notes (10), (11), (12), (13)]
Puissance moyenne égale ou inférieure à 10 W	Aucun niveau n'est précisé pour les émetteurs fonctionnant sur des fréquences assignées supérieures à 235 MHz. Pour ces émetteurs, la puissance des rayonnements non essentiels devra être aussi faible que pratiquement possible.	100 µW [Notes (10), (11), (12), (13)]
Au-dessus de 17,7 GHz		Compte tenu de la nature diverse des techniques appliquées par les services fonctionnant au-dessus de 17,7 GHz, il est nécessaire que le CCIR poursuive ses travaux avant que l'on spécifie les niveaux. Dans la mesure du possible, les valeurs qui devront être respectées seront celles qu'indiqueront les Avis pertinents du CCIR et, tant que de tels Avis n'auront pas été élaborés, on appliquera les valeurs les plus faibles qu'il est possible d'obtenir (voir la Recommandation 66).

Notes du tableau des niveaux de puissance maximaux tolérés des rayonnements non essentiels

(1) Pour s'assurer que les dispositions du tableau sont appliquées, on doit vérifier que la larguer des bandes de l'appareil de mesure est assez grande pour couvrir toutes les composantes significatives du rayonnement non essentiel concerné.

(2) Pour les émmetteurs dont la puissance moyenne est supérieure à 50 kW et qui fontionnent au-dessous de 30 MHz sur une gamme de fréquences d'environ une octave ou davantage, une réduction à moins de 50 mW nést pas obligatoire; cependant, un affaiblissement de 60 décibles au minimum doit être obtenu et on s'efforcera d'atteindre le niveau de 50 mW.

(3) Pour les appareils portatifs dont la puissance moyenne est inférieure à 5 W, fonctionnant au-dessous de 30 MHz, l'affaiblissement doit être d'au moins 30 décibles; cependant, on s'efforcera d'atteindre l'affaiblissement de 40 décibels.

(4) Pour les émetteurs mobiles fonctionnant au-dessous de 30 MHz, toute composante non essentielle doit avoir un affaiblissement d'au moins 40 décibels, sans dépasser la valeur de 200 mW; cependant, on s'efforcera, dans tous les cas où cela sera possible en pratique, d'atteindre le niveau de 50 mW.

(5) Pour les appareils de radiotéléphonie à modulation de fréquence du service mobile maritime fonctionnant au-dessous de 30 MHz, la puissance moyenne de tout rayonnement non essentiel due à des produits de modulation dans toute autre voie du service mobile maritime international, ne doit pas dépasser un niveau de 10 μW et la puissance moyenne de tout autre rayonnement non essentiel sur une fréquence discrète quelconque de la bande du service mobile maritime international ne doit pas dépasser un niveau de 2,5 μW. Dans les cas exceptionnels où l'on utilise des émetteurs de plus de 20 watts de puissance moyenne, on peut augmenter ces derniers niveaux proportionnellement à la puissance moyenne de l'émetteur.

(6) Pour les émetteurs dont la puissance moyenne ets inférieur à 100 mW, il n'est pas obligatoire d'atteindre le niveau d'affaiblissement de 40 décibels, pourvu que le niveau de la puissance moyenne ne dépasse pas 10 μW.

(7) Pour les émetteurs dont la puissance moyenne est supérieure à 50 kWet qui peuvent fonctionner sur plusieurs fréquences en counvrant une gamme de fréquences d'énviron une octave ou davantage, une réduction à moins de 50 μW n'est pas obligatoire; cependant, un affaiblissement minimal de 60 décibels doit être obtenu.

(8) Pour les appareils portatifs dont la puissance moyenne est inférieure à 5 W, l'affaiblissement doit être de 30 décibels; cependant, on s'efforcera, dans tous les cas où cela sera possible en pratique, d'atteindre l'affaiblissement de 40 décibels.

(9) Les administrations peuvent adopter un niveau de 10 mW, à condition d'éviter tout brouillage préjudiciable.

(10) Lorsque plusieur émetteur utilisent une antenne commune ou des antenners très faiblement espacées sur des fréquences voisines, on s'efforcera, dans touts les cas où cela sera possible en pratique, d'atteindre les niveaux spécifiés.

(11) Puisqu'il se peut que ces niveaux n'assurent pas une protection suffisante aux stations de réception du service de radioastronomie et des services spatiaux, on pourrait envisager, dans chaque cas d'espèce, des niveaux plus en tenant compte de la situation géographique des stations intéressées.

(12) Ces niveaux ne s'appliquent pas aux systèmes utilisant les techniques de modulation numérique, mais peuvent servir à titre de directives. Pour les valeurs applicables à ces systèmes, on pourra, lorsqu'on en dispose, se référer aux Avis pertinents du CCIR (voir la Recommandation **66**).

(13) Ces niveaux ne s'appliquent pas aux stations des services spatiaux mais il convient que les niveaux des rayonnements non essentiels de ces stations soient réduits aux valeurs les plus faibles possibles compatibles avec les contraintes techniques et écononiques imposées au matériel. Pour les valeurs applicables à ces systèmes, on pourra, lorsqu'on en dispose, se référer aux Avis pertinents du CCIR (voir la Recommandation **66**).

MOD **AP9**

APPENDICE 9

Documents de service (1)

(Voir les articles 10, 12, 13, 17 et 26)

LISTE I

Liste internationale des fréquences

L'IFRB établit et tient à jour les titres des colonnes de la Liste internationale des fréquences de manière à respecter la totalité des dispositions réglementaires des appendices **1** et **3** ainsi que les décisions connexes des conférences futures. En outre, l'IFRB apportera à ladite Liste les améliorations nécessaires du point de vue de la présentation sans modifier de quelque manière que se soit les données fondamentales spécifiées dans le Règlement des radiocommunications.

LISTE II

Nomenclature des stations fixes qui assurent des liaisons internationales

Noms des pays par ordre alphabétique des abréviations

Noms des stations par ordre alphabétique

Nom de la station d'émission	Indicatif d'appel (signal d'identification)	Fréquence assignée (kHz ou MHz)	Localité(s) ou zone(s) avec laquelle (lesquelles) la (les) communication(s) est (sont) établie(s)	Observations
1	2	3	4	5

SUP

LISTE III-B

Nomenclature des stations de radiodiffusion fonctionnant dans les bandes comprises entre 5950 kHz et 26 100 kHz

LISTE IV

Nomenclature des stations côtières

PARTIE I

Tableuax d'intérêt général ou particulier

PARTIE II

Index alphabétique des stations côtières

Nom de la station	Voir partie III, page ...	Nom de la station	Voir partie III, page	Nom de la station	Voir partie III, page ...

PARTIE III

Stats signalétiques des stations côtières

Noms des pays par ordre alphabétique des abreviations

Noms des stations par ordre alphabétique

Nom de la station (1)	Indicatif d'appel (2) (3)	Emission			Service			Taxes (4) (*)	Coordonnées géographiques de l'antenne d'émission (longitude et latitude en degrés, minutes et secondes).	Observations (5) (6)
		Fréquences (kHz ou MHz)		Classe	Puissance (kW) (7)	Nature (7) e (8)	Heures d'ouverture (UTC)			
1	2	3a (9)	3b (9)	4	5	6	7	8	9	10

(1) Pour chaque pays, on indique la ou les stations côtières sur lesquelles il faut diriger les radiotélégrammes destinés à être transmis sur ondes décamétriques à destination des navires.

(2) Indiquer si la station a une identité dans le service mobile maritime.

(3) L'indicatif d'appel de la station est suivi, s'il y a lieu, entre parenthèses, de l'identité dans le service mobile maritime ou du numéro ou du signal d'appel sélectif que la station utilise.

(4) Fréquence d'émission. La fréquence normale de travail est imprimée en caractères gras.

(5) Fréquences ou voies de veille et ou de réception.

(6) Dans le cas d'antennes directives, il y a lieu de mentionner, au-dessous de l'indication de la puissance, l'azimut de la direction ou des directions du gain maximum, en degrés à partir du Nord vrai, dans les sens des aiguilles d'une montre.

(7) Indiquer si la station utilise un système d'appel sélectif et préciser le système utilisé.

(8) Indiquer si la station utilise un système de télégraphie à impression directe à bande étroite.

(*) La taxe de ligne télégraphique du pays dont dépend la station côtière et la taxe appliquée par ce pays aux télégrammes à destination des pays limitrophes sont indiquées dans la partie IV de la Nomenclature des stations côtières.

(**) Si les comptes de taxes sont liquidés par une exploitation privée, il y a lieu d'indiquer, le cas échéant, le nom et l'adresse de cette exploitation privée.

(9) Indiquer si la station assume un service de radiotétection.

(10) Il convient que la Nomenclature contienne les renseignements concernant les heures d'émission des listes d'appels ainsi que les heures de veille de la station côtière sur les diverses fréquences, etc. Les stations côtières ou les stations côtières terriennes ouvertes à la correspondance publique et assurant un service d'émission et de réception de radiotélégrammes par radiotéléphonie sont indiqués dans la Nomenclature des stations côtières.

PARTIE IV

Taxes télégraphiques intérieures, limitrophes, etc.

LISTA V

Nomenclature des stations de navire

États signalétiques des stations de navire

Les renseignements relatifs à ces stations sont publiés comme il est indiqué ci-dessous:

Nom du navire	Indicatif d'appel	Pays	Installations auxiliaires	Classe du navire	Nature du service	Heures d'ouverture	Bandes des fréquences d'émission en télégraphie	Bandes des fréquences d'émission en téléphonie	Taxe de bord par mot applicable aux radiotélégrammes.	Taxe de bord applicable à une conversation radiotéléphonique de trois minutes.	Observations
1	2	3	4	5	6	7	8	9	10	11	12

Colonne 1 — les stations sont classées par ordre alphabétique des noms de navire sans considération de nationalité. En cas d'homonymie, le nom du navire est suivi de l'indicatif d'appel, le nom et l'indicatif étant séparés par une barre de fraction.

Colonne 2 — indicatif d'appel. Cette colonne contient également, le cas échéant, l'identité dans le service mobile maritime ou le numéro ou signal d'appel sélectif.

Collone 3 — pays dont relève la station (indication au moyen du symbole approprié).

Colunne 4 — installations auxiliaires, y compris des renseigments concernant:

a) Le nombre des embarcations de sauvetage munies d'appareils radioélectriques installés à bord;

b) Le type et le nombre des radiobalises de localisation des sinistres (facultatif), la fréquence utilisée étant désignée par l'une des lettres suivantes:

A = 2182 kHz;
B = 121,5 MHz;
C = 243 MHz.

Un chifrre suivant la lettre indique le nombre des radiobalises, la lettre «X» remplace ce chiffre lorsque ce nombre n'a pas été indiqué.

Colonnes 5 à 7 — sous forme de notations de service (voir l'appendice **10**). De plus, la liste des symboles utilisés dans la colonne 5 pour désigner la classe du navire dans la préface à la Nomenclature.

Collonnes 8 et 9 — indication des bandes de fréquences et des classes d'émission au moyen des symboles suivants:

Radiotélegraphie	*Radiotéléphonie*
W = 110-150 kHz	T = 6105-4000 kHz
X = 405-535 kHz	U = 4000-27 500 kHz
Y = 1605-3800 kHz	V = 156-174 MHz
Z = 4000-27 500 khz	

Ces symboles sont, le cas échéant, suivis de renvois succincts, à la fin de la Nomencalture, qui contiennent des renseignements de nature spéciale et l'indication des fréquences sur lesquelles émetteurs sont réglés.

Colonne 10 — taxe de bord de base applicable par mot aux radiotélégrammes (1).

Colonne 11 — taxe minimale pour une conversation radiotéléphonique de trois minutes (1). Les renseignements qui figurent dans les colonnes 10 et 11 sont suivis d'un renvoi qui désigne l'administration ou l'exploitation privée à laquelle

(1) Ces taxes sont fixées ou approuvées par chaque administration.

laquelle les comptes de taxe doivent être adressés. En cas de changement de l'adresse de l'exploitant, un second renvoi après la taxe donne le nouvelle adresse et la date à partir de laquelle le changement entrera en vigueur.

Colonne 12 — lorsque plusieurs stations de navire de la même nationalité portent le même nom, ou lorsque les comptes de taxes doivent être adressés directement ao propriétaire du navire, le nom de la compagnie de navigation ou de l'armatuer auquel appartient le navire est mentionné dans cette colonne.

De plus, en cas de manque de place dans la colonne appropriée, des renseignements supplémantaires relatifs aux colonnes 1 à 11 peuvent figurer dans la colonne 12 au moyen d'un renvoi. Cette colonne peut comporter plusierurs lignes.

Indiquer si l'identité dans le service mobile maritime est prévue.

Indiquer si la station utilise un système d'appel sélectif et préciser le système employé.

Indiquer si la station utilise un système de télégraphie à impression directe à bande étroite.

LISTE VI

Nomenclature des stations de radiorepérage et des stations effectuant des services spéciaux

(Aux fins de la navigation, il convient d'utiliser la présent Nomenclature avec précaution. Voir l'article 35 du Règlement des radiocommunications).

Noms des pays notificateurs par ordre alphabétique des symboles désignant les pays

Noms des stations par ordre alphabétique ou numérique de leur désignation

Identité de la station	Emission des renseignements de radionavigation à destination des navires			Réception des renseignements de radionavigation en provenance des navires		Zone(s) de service sur la Terre	Nom de la localité et du pays ou est (ou sont) située(s) la (ou les) stations(s) terrienne(s) fixe(s) associée(s)	Administration ou compagnie exploitante	Observations: Renseignements relatifs à l'orbite, dispositions spéciales des canaux, méthodes spéciales de modulation, taxes, etc.
	Fréquence (en MHz ou GHz)	Classe d'émission, largeur de bande nécessaire et nature de la transmission	Puissance (en watts)	Fréquence (en MHz ou GHz)	Classe d'émission, largeur de bande nécessaire et nature de la transmission				
1	2a	2b	2c	3a	3b	4	5	6	7

Note. — Le Secrétaire général, s'il l'estime nécessaire, introduira dans cette nomenclature des sections supplémentaires relatives aux dispositifs nouveaux, au fur et à mesure du développement de leur emploi.

LISTE VIII

Nomenclature des stations de contrôle international des émissons

(Voir l'article 20)

Remarque. — Dans cette Liste, les stations désignées par les administrations comme susceptibles de participer au système de contrôle international des émissons portent l'indication (SCIE).

PARTIE I

Bureaux centralisateurs

Noms des pays par ordre alphabétique des abréviations.

Bureau centralisateur national (adresses postale et télégraphie, numéro de téléphone et tout autre renseignement).

PARTIE II

Contrôle des émissions des stations des services de radiocommunication de Terre

A) États signalétiques des stations de contrôle qui effectuent des mesures de fréquence

Noms des pays par ordre alphabétique des abréviations.
Noms des stations par ordre alphabétique.

Nom et coordonnées géographiques de la station (longitude et latitude en degrés et minutes).
Heures de service (UTC).
Gammes des fréquences mesurables (en kHz, MHz ou GHz).
Précision des mesures (1).
Observations.

B) États signalétiques des stations de contrôle qui effectuent des mesures d'intensité de champ ou de puissance surfacique

Noms des pays par ordre alphabétique des abréviations.
Noms des stations par ordre alphabétique.

Nom et coordonnées géographiques de la station (longitude et latitude en degrés et minutes).
Heures de service (UTC).
Gammes des fréquences (en kHz, MHz ou GHz).
Valeures maximum et minimum des intensités de champ ou des puissances surfaciques mesurables.
Précision des mesures en dB (1).
Observations.

C) États signalétiques des stations de contrôle qui effectuent des mesures radiogoniométriques

Noms des pays par ordre alphabétique des abréviations.
Noms des stations par ordre alphabétique.

Nom et coordonnées géographiques de la station (longitude et latitude en degrés, minutes et secondes).
Heures de service (UTC).
Gammes des fréquences (en kHz, MHz ou GHz).
Types des antennes utilisées.
Observations.

(1) Indiquer le maximum de précision qui peut être atteint pour chaque gamme de fréquences.

D) États signalétiques des stations de contrôle qui effectuent des mesures de larguer de bande

Noms des pays par ordre alphabétique des abréviations.
Noms des stations par ordre alphabétique.

Nom et coordonnées géographiques de la station (longitude et latitude en degrés et minutes).
Heures de service (UTC).
Gammes des fréquences (en kHz, MHz ou GHz).
Méthode(s) des mesure (1).
Pouvoir séparatuer à — 60 dB (le cas échéant).
Observations.

E) États signalétiques des stations de contrôle qui effectuent des relevés automatiques du degré d'ocupation du spectre

Noms des pays par ordre alphabétique des abréviations.
Noms des stations par ordre alphabétique.

Nom et coordonnées géographiques de la station (longitude et latitude en degrés et minutes).
Heures de service (UTC).
Gammes des fréquences (en kHz, MHz ou GHz).
Méthode(s) utilisée(s).
Observations.

PARTIE III

Contrôle des émissions de stations des services de radiocommunication spatiale

États signalétiques des stations de contrôle qui effectuent des mesures se rapportant aus stations des services de radiocommunication spatiale

Noms des pays par ordre alphabétique des symboles.
Noms des stations par ordre alphabétique.

Nom et coordonnées géographiques de la station (longitude et latitude en degrés, minutes et secondes).
Heures de service (UTC).
Renseignements sur les antennes utilisées (par exemple: diamètre ou gain en fonction de la fréquence; le cas échéant, vitesse d'exploration; etc.)
Gamme des angles d'azimut et de site.
Précision maximum qui peut être atteinte dans la détermination des positions orbitales des stations spatiales.
Renseignements sur le système de polarisation.
Température de bruit du système.
Gammes des fréquences, avec indication du maximum de précision de fréquence qui peut être atteint dans chaque gamme.
Gammes de fréquences dans lesquelles il est possible de mesurer l'intensité de champ ou la puissance surfacique.
Valeures minimum des intensité de champ ou de la puissence surfacique mesurable, avec indication de la précision de mesure qui peut être atteinte.
Renseignements disponibles pour la mesure de la largeur de bande (1).
Renseignements disponibles pour la mesure de l'occupation du spectre.
Renseignements disponibles pour la mesure de l'occupation de l'orbite.
Observations.

(1) Voir les Avis et Rapports pertinents du CCIR.

Liste VIII-A

Nomenclature des stations des services de radiocommunication spatiale et du service de radioastronomie

Le Comité établit et tient à jour le contenu de cette liste, en groupe ses rubriques de telle façon que les administrations puissent identifier plus facilement touts les stations faisant partie d'un réseau à satellite donné. De plus, le Comité apporte les améliorations nécessaires à la présentation de la liste, sans modifier de quelque maniére que ce soit les données fondamentales spécifiées dans le Règlement des radiocommunications.

APPENDICE 10

Notations utilisées dans les documents de service

(Voir l'article 26 et l'apedendice 9)

■	Station classé comme située dans une région à trafic intense (voir l'article 60) («TI») (1)
O	De jour («HJ»)(1).
●	De nuit («HN») (1).
[]	Navire pourvu d'embarcations de sauvetage munies d'appareils radioélectriques installés à bord; le nombre entre les crochets indique le nombre de ces embarcations de sauvatage («S») (1).
Δ	(SUP).
AL	Station terrestre de radionavegation aéronautique.
AM	Station mobile de radionavegation aéronautique.
AT	Station d'amateur.
AX	Station fixe aéronautique.
BC	Station de radiodiffusion sonore.
BT	Station de radiodiffusion, télévision.
C	Exploitation continue pendant la période indiquée.
CA	Navire de charge.
CO	Station ouverte à la correspondance officielle exclusivement.
CP	Station ouverte à la correspondance publique.
CR	Station ouverte à la correspondance publique restreinte.
CV	Station ouverte exclusivement à la correspondence d'une entreprise privée.
D30°	Antenne dont la direction de rayonnement maximum est 30° (direction exprimée en degrés à partir du Nord vrai, de 0 à 360, dans le sense des aiguiles d'une montre).
DR	Antenne à effet directif pourvue d'un réflecteur.
EA	Station spatiale du service d'amateur par satellite.
EB	Station spatiale du service de radiodiffusion par satellite (radiodiffusion sonore).
EC	Station spatiale du service fixe par satellite.
ED	Station spatiale de télécommande spatiale.
EG	Station spatiale du service mobile maritime par satellite.
EH	Station spatiale de recherce spatiale.
EK	Station spatiale du poursuite spatiale.
EM	Station spatiale de satellite de météorologie.
EN	Station spatiale de satellite de radionavigation.
ER	Station spatiale de télémesure spatiale.
EV	Station spatiale du service de radiodiffusion par satellite (télévision).
EX	Station expérimentale.
FA	Station aéronautique.
FB	Station de base.

(1) Le symbole entre parenthèses peut être utilisé dans les notifications ainsi que dans les documents de service.

FC	Station côtière.
FE	(SPU).
FL	Station terrestre.
FP	Station des opérations portuaires.
FR	Station uniquement réceptrice, reliée au réseau géneral des voies de télécommunication.
FS	Station terrestre établie uniquement pour la sécurité de la vie humaine.
FX	Station fixe.
GS	Station à bord d'un navire de guerre ou d'un aéronef de l'armée ou de la marine.
H	Exploitation selon un horaire déterminé.
H8	Service de 8 heures effectué par une station de navire de la troisième catégorie.
H16	Service de 16 heures effectué par une station de navire de la deuxième catégorie.
H24	Exploitation continue de jour et de nuit.
HJ	Service de jour.
HN	Service de nuit.
HT	Exploitations pendant les périodes de transition entre le jour et la nuit.
HX	Exploitation intermittente de jour et de nuit ou station n'ayant pas de vacations déterminées.
I	Exploitation intermittente pendant la période indiquée.
LR	Station terrestre de radiolocalisation.
MA	Station d'aéronef.
ME	Station spatiale.
ML	Station mobile terrestre.
MO	Station mobile.
MR	Station mobile de radiolocalisation.
MS	Station de navire.
ND	Antenne dépourvue d'effet directif.
NL	Station terrestre de radionavigation maritime.
OD	Station de transmission de données océanographiques.
OE	Station qui interroge des stations de transmission de données océanographiques.
OT	Station écoulant exclusivement le trafic de service du service intéressé.
PA	Navire à passagers.
RA	Station de radioastronomie.
RC	Radiophare non directionnel.
RD	Radiophare directionnel.
RG	Station radiogoniométrique.
RM	Station mobile de radionavigation maritime.
RT	Radiophare tournant.
SM	Station du service des auxiliares de la météorologie.
SS	Station émmettant des fréquences étalon et des signaux horaires.
TA	Station terrienne d'exploitation spatiale du service d'amateur par satellite.
TC	Station terrienne du service fixe par satellite.
TD	Station terrienne de télécommande spatiale.
TE	Station terrienne d'émission.
TF	Station terrienne fixe du service de radiorepérage par satellite.
TG	Station terrienne mobile du service mobile maritime par satellite.
TH	Station terrienne du service de recherche spatiale.
TI	Station terrienne du service mobile maritime par satellite située en un point fixe déterminé.
TK	Station terrienne de poursuite spatiale.
TL	Station terrienne mobile du service de radiorepérage par satellite.
TM	Station terrienne du service de météorologie par satellite.
TMG	Temps moyen de Greenwich.
TN	Station terrienne du service de radionavigation par satellite.
TP	Station terrienne de réception.
TR	Station terrienne de télemesure spatiale.
TS	Voie son (télévision).
TT	Station terrienne du service d'exploitation spatiale.
TV	Voie image (télevision).
UTC	Temps universel coordonné.

(Les symboles peuvent être modifiés selon les besoins.)

MOD AP11

APPENDICE 11

Documents dont les stations de navire et les stations d'aéronef doivent être pourvues

(Voir les articles **24, 26, 44, 46, 49, 55, 57, 59** et l'appendice **9**)

SECTION I

Stations de navire obligatoirement pourvues d'une installation radiotélégraphique en vertu d'un accord international

Ces stations doivent être pourvues:

1) De la licence prévue à l'article 24;
2) Du certificat de chaque opérateur;
3) Du registre (journal du service radioeléctrique) sur lequel sont notés, au moment où ils ont lieu et avec l'indication de l'heure:
   a) Dans leur intégralité, toutes les communications relatives au trafic de detrésse;
   b) Les communications d'urgence et de sécurité;
   c) L'écoute assurée sur la fréquence internationale de détresse pendant les périodes de silence;
   d) Les communications entre la station du navire et les stations terrestres ou mobiles;
   e) Les incidents de service de toute nature;
   f) Si le règlement du bord le permet, la position du navire au moins une fois par jour;
   g) L'ouverture et la clôture de chacune des vacations;
4) De la Liste alphabétique des indicatifs d'appel des stations utilisées dans le service mobile maritime;
5) De la Nomenclature des stations côtières;
6) De la Nomenclature des stations de navire (il est facultatif pour la station de disposer du supplément);
7) De la Nomenclature des stations de radiorepérage et des stations effectuant des services spéciaux;
8) Du Manuel á l'usage des services mobile maritime et mobile maritime par satellite;
9) Des tarifs télégraphiques des pays à destination desquels la station transmet le plus fréquemment des radiotélégrames.

SUP 10

SECTION II

Autres stations radiotélégraphiques de navire

Ces stations doivent être pourvues des documents visés aux alinéas 1 à 6 inclus, 8 et 9 de la section I.

SECTION III

Stations de navire obligatoirement pourvues d'une installation radiotéléphonique en vertu d'un accord international

Ces stations doivent être pourvues:

1) De la licence prèvue à l'article 24;
2) Du certificat de chaque opérateur;
3) Du registre (journal du service radioeléctrique) sur lequel sont notés, au moment où ils ont lieu et avec l'indication de l'heure:
   a) Un résumé de toutes les communications relatives au trafic de détresse, d'urgence et de sécurité;
   b) Un résumé des communications entre la station du navire et les stations terrestres ou mobiles;
   c) Une mention des incidents de service importants;
   d) Si le règlement du bord le permet, la position du navire au moins une fois par jour;
4) D'une liste des stations côtières avec lesquelles elles sont susceptibles d'échanger des communications, cette liste mentionnant les heures de veille, les heures de veille, les fréquences et les taxes;
5) Des dispositions du Règlement des radiocommunications et des Résolutions et Avis du CCITT applicables au service mobile maritime radiotéléphonique, ou du Manuel à l'usage des services mobile maritime et mobile maritime par satellite.

SECTION IV

Autres stations radiotéléphoniques de navire

Ces stations doivent être pourvues:

1) Des documents visés aux alinéas 1 et 2 de la section III;
2) Des documents visés aux alinéas 3, 4 et 5 de la section III, selon les exigences des administrations intéressées.

SECTION V

Stations de navire équipées de plusieurs installations

Ces stations doivent être pourvues:

1) Pour chaque installation, si c'est nécessaire, des documents visés aux alinéas 1, 2 et 3 de la section I, ou aux alinéas 1, 2 et 3 de la section III selon le cas;
2) Pour une seule d'entre elles, des autres documents visés par les sections I ou III selon le cas.

SECTION VI

Stations d'aéronef

Ces stations doivent être pourvues:

1) Des documents visés aux alinéas 1 et 2 de la section I;
2) Du registre (journal du service radioélectrique) visé à alinéa 3 de la section I, à moins que les administrations intéressées n'aient adopté d'autres dispositions pour l'enregistrement de toutes les informations que ledit registre doit mentionner;
3) Des autres documents contenant les renseignements officiels relatifs aux stations auxquels la station d'aéronef peut avoir recours pour l'exécution de son service.

NOC **AP12**

APPENDICE 12

Vacations des stations de navire classées dans la deuxième ou dans la troisième catégorie

(Voir les articles 26 et 58)

SECTION I

Tableau

Vacations — Heure locale du navire ou heure du fuseau horaire (voir les numéros **4058** et **4059**)	
16 heures (H16)	8 heures (H8)
De 00.00 à 04.00 heures. De 08.00 à 12.00 heures. De 16.00 à 18.00 heures. De 20.00 à 22.00 heures. Plus 4 heures. (Voir le numéro **4058**).	De 08.00 à 12.00 heures. De 18.00 à 22.00 heures (*a*). Plus 2 heures. (Voir le numéro **4059**).

(*a*) Deux heures de service continu entre 18.00 et 22.00, heure locale du navire ou heure du fuseau horaire, fixées par l'administration, le commandant ou la personne responsable.

SECTION II

Graphique et mappemonde

Note *a*) — Le graphique indique les vacations *fixes* et les vacations *à option* des stations de navire classées dans la deuxième ou dans la troisième catégorie, suivant les fuseaux horaires. (Les vacations indiquées ne comprennent pas celles qui sont fixées par l'administration, le commandant ou la personne responsable du navire.)

Les vacations *fixes* sont répresentées de la manière suivante:

I) Pour les navires classés dans la deuxième catégorie .....

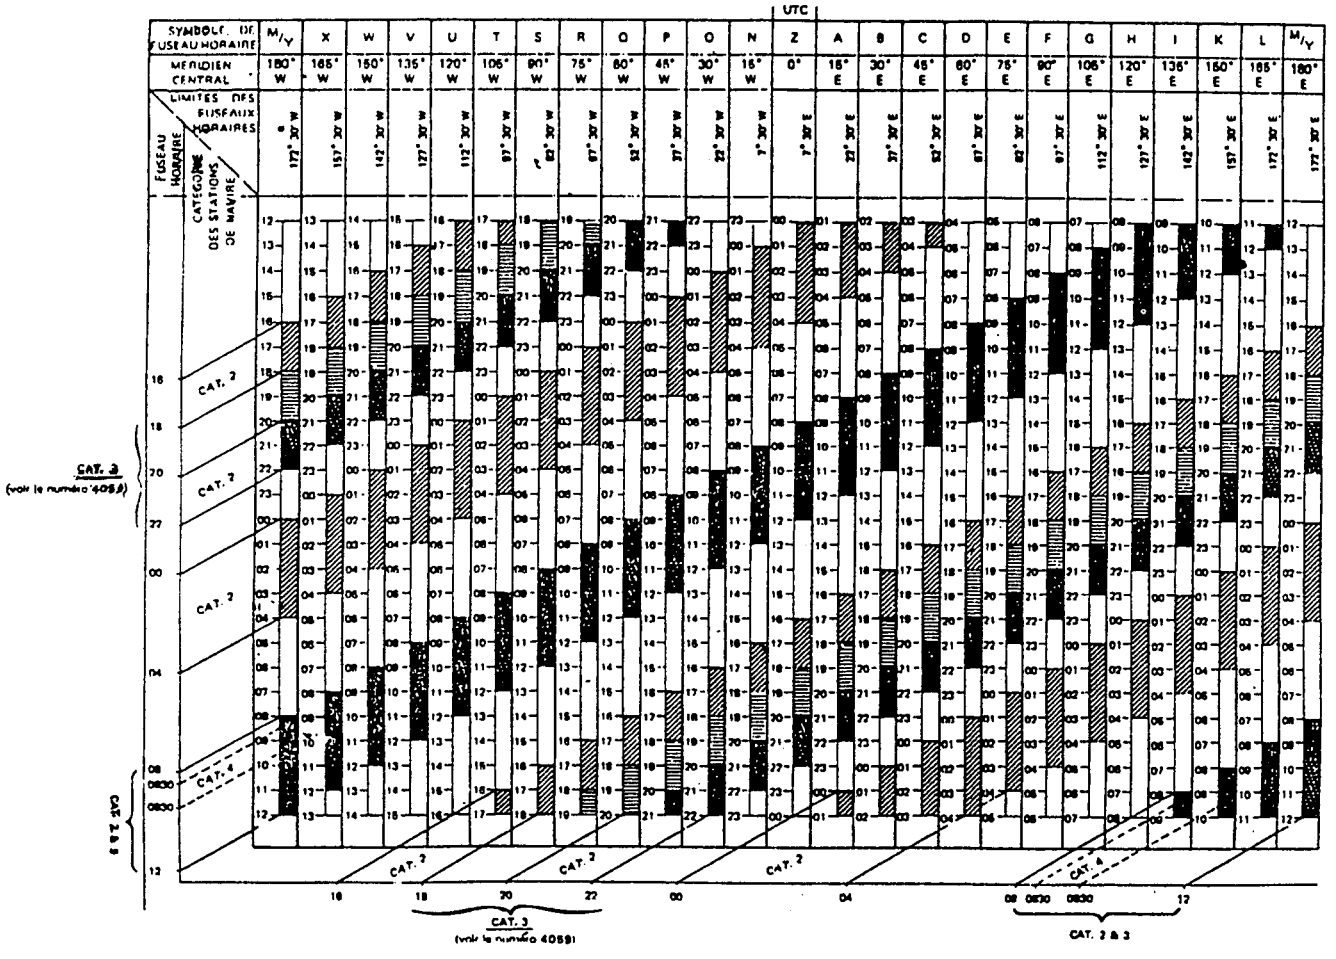
II) Pour les navires classés dans la deuxième ou dans la troisième catégorie .....

III) Pour les navires classés dans la troisième catégorie, période dans laquelle les deux heures de service continu peuvent être choisies .....

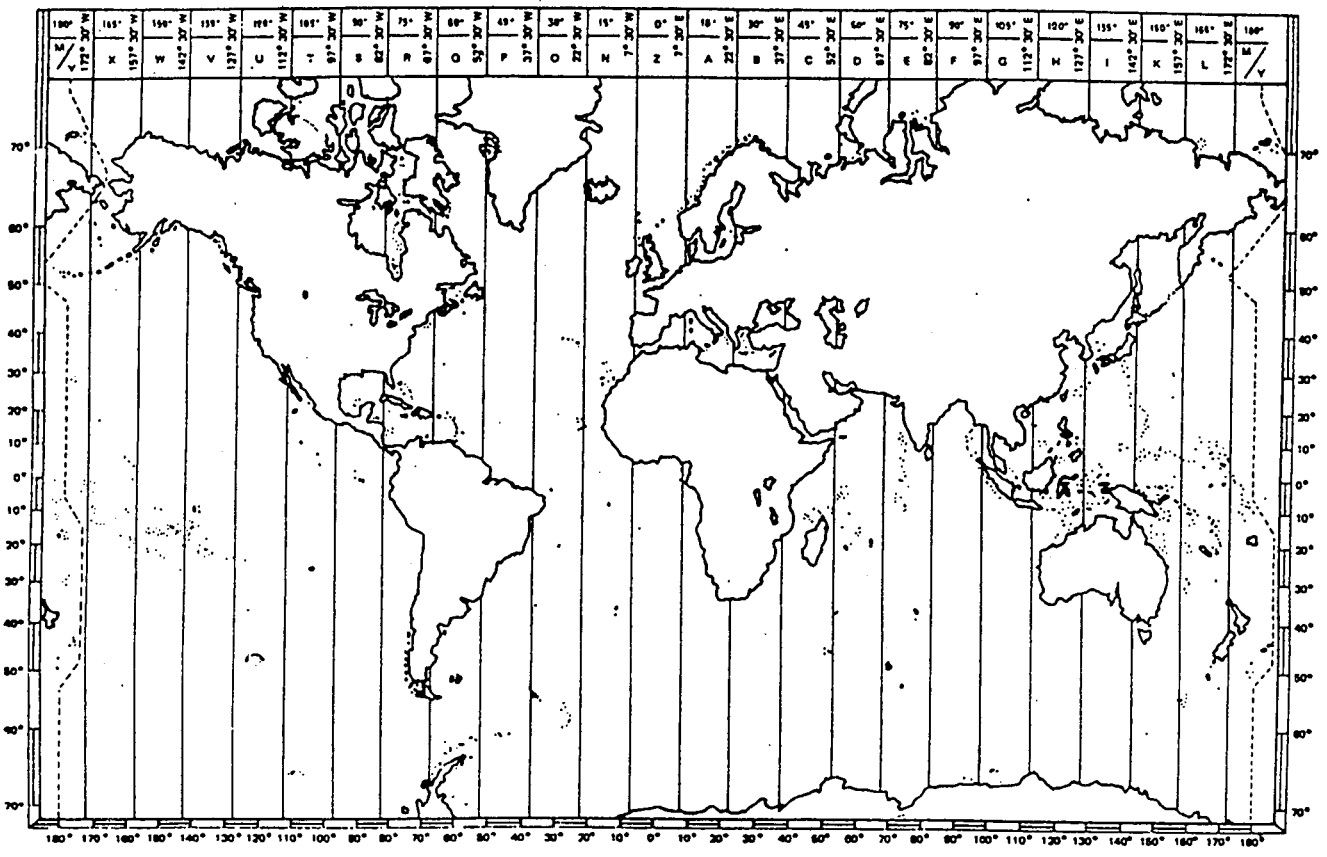
Note *b*) — Le graphique indique également (en noir) la période entre 08.30-09.30 pendant laquelle il est recommandé aux navires classés dans la quatrième catégorie d'assurer le service (voir le numéro **4062**).

GRAPHIQUE

Vacations, par fuseau horaire, des stations de navire



MAPPEMONDE (FUSEAUX HORAIRES)



NOC AP13

APPENDICE 13

Abréviations et signaux divers à employer dans les communications radiotélégraphiques, à l'exception de celles du service mobile maritime

(Voir l'article 52)

SECTION I

Code Q

Introduction

1. Les séries de groupes QRA à QUZ, mentionnées ci-après, sont utilisables dans tous les services.

2. Les séries QAA à QNZ sont réservées au service aéronautique et les séries QOA à QQZ sont réservées aux services maritimes. Elles ne font pas partie du présent Règlement (1).

3. On peut donner un sens affirmatif ou négatif à certaines abréviations du code Q en transmettant respectivement YES ou NO immédiatement après l'abréviation.

4. La signification des abréviations du code Q peut être étendue ou complétée par l'addition appropriée d'autres abréviations, d'indicatifs d'appel, de noms de lieux, de chiffres, de numéros, etc. Les espaces en blanc contenus entre parenthèses correspondent à des indications facultatives. Ces indications sont transmises dans l'ordre où elles se trouvent dans le texte de tables ci-après.

5. Les abréviations du code Q prennent la forme de questions quand elles sont suivies d'un point d'interrogation. Quand une abréviation employée comme question est suivie d'indications complémentaires, il convient de faire suivre celles-ci d'un point d'interrogation.

6. Les abréviations du code Q comportant plusieurs significations numérotéls sont suivies du numéro approprié qui précise le sens choisi. Ce numéro est transmis immédiatement après l'abréviation.

7. Le heures sont indiquées en Temps universel coordonné (UTC) à moins d'indications contraires dans les questions ou réponses.

---

(1) Note du Secrétariat général: les séries QOA à QQZ figurent à l'appendice **14.**

Abréviations utilisables dans tous les services

A) Liste de abréviations par ordre alphabétique

Abréviation	Question	Réponse ou avis
QRA	Quel est le nom de votre station?	Le nom de ma station est ...
QRB	A quelle distance approximative vous trouvez-vouz de ma station?	La distance approximative entre nos stations est de ... milles nautiques (*ou* kilomètres).
QRC	Par quelle exploitation privée (*ou* administration d'État) sont liquidés les comptes de taxes de votre station?	Les comptes de taxes de ma station sont liquidés par l'exploitation privée... (*ou* par l'administration de l'État ...).
QRD	Où allez-vouz et d'où venez-vouz?	Je vais à ... et je viens de ...
QRE	A quelle heure comptez-vous arriver à ... (*ou* au-dessus de ...) *(lieu)*?	Je compte arriver à ... (*ou* au-dessus de ...) *(lieu)* à ... heures.
QRF	Retournez-vous à ... *(lieu)*?	Je retourne à ... *(lieu)*. *ou* Retournez à ... *(lieu)*.
QRG	Voulez-vous m'indiquer ma fréquence exacte (*ou* la fréquence exacte de ...)?	Votre fréquence exacte (*ou* la fréquence exacte de ...) est ... kHz (*ou* MHz).
QRH	Ma fréquence varie-t-elle?	Votre fréquence varie.
QRI	Quelle est la tonalité de mon émission?	La tonalité de votre émission est ... 1. Bonne; 2. Variable; 3. Mauvaise.
QRJ	Combien d'appels radiotéléphoniques avez-vous en instance?	J'ai ... appels radiotéléphoniques en instance.
QRK	Quelle est l'intelligibilité de mes signaux (*ou* des signaux de ...)?	L'intelligibilité de vos signaux (*ou* des signaux de ...) est ... 1. Mauvaise; 2. Médiocre; 3. Assez bonne; 4. Bonne; 5. Excellente.
QRL	Etes-vous occupé?	Je suis occupé (*ou* Je suis occupé avec ...). Prière de ne pas brouiller.
QRM	Etes-vous brouillé?	Je suis brouillé ... 1. Je ne suis nullement brouillé; 2. Faiblement; 3. Modérément; 4. Fortement; 5. Très fortement.
QRN	Etes-vous troublé par des parasites?	Je suis troublé par des parasites ... 1. Je ne suis nullement troublé par des parasites; 2. Faiblement; 3. Modérément; 4. Fortement; 5. Très fortement.
QRO	Dois-je augmenter la puissance d'émission?	Augmentez la puissance d'émission.
QRP	Dois-je diminuer la puissance d'émission?	Diminuez la puissance d'émission.
QRQ	Dois-je transmettre plus vite?	Transmettez plus vite (... mots par minute).
QRR	Etes-vous prêt pour l'emploi des appareils automatiques?	Je suis prêt pour l'emploi des appareils automatiques. Transmettez à la vitesse de ... mots par minute.
QRS	Dois-je transmettre plus lentement?	Transmettez plus lentement (... mots par minute).
QRT	Dois-je cesser la transmission?	Cessez la transmission.
QRU	Aves-vous quelque chose pour moi?	Je n'ai rien pour vous.
QRV	Etes-vous prêt?	Je suis prêt.
QRW	Dois-je aviser ... que vous l'appelez sur ... kHz (*ou* MHz)?	Prière-d'aviser ... que je l'appelle sur ... kHz (*ou* MHz).
QRX	A quel moment me rappellerez-vous?	Je vous rappellerai à ... heures [sur ... kHz (*ou* MHz)].
QRY	Quel est mon tour *(concerne les communications)*?	Le numéro de votre tour est ... *(ou d'aprés toute autre indication) (concerne les communications)*.
QRZ	Par qui suis-je appelé?	Vous êtres appelé par ... [sur ... kHz (*ou* MHz)].
QSA	Quelle est la force de mes signaux (*ou* des signaux de ...)?	La force de vos signaux (*ou* des signaux de ...) est ... 1. À peine perceptible; 2. Faible; 3. Assez bonne; 4. Bonne; 5. Très bonne.
QSB	La force de mes signaux varie-t-elle?	La force de vos signaux varie.
QSC	Etes-vous un navire de charge?	Je suis un navire de charge.
QSD	Ma manipulation est-elle défectueuse?	Votre manipulation est défectueuse.
QSE	Quelle est la dérive estimée de l'engin de sauvetage?	La dérive estimée de l'engin de sauvetage est ... *(chiffre et unité)*.
QSF	Avez-vous effectué le sauvetage?	J'ai effectué le sauvetage et je me dirige sur la base de ... (avec ... blessés nécessitant ambulance).
QSG	Dois-je transmettre ... télégrammes à la fois?	Transmettez ... télégrammes à la fois.

Abréviation	Question	Réponse ou avis
QSH	Pouvez-vous effectuer un ralliement avec votre radiogoniomètre?	Je peux avec mon radiogonomètre effectuer un ralliement (rallier la station de ...).
QSI	—	Il m'a été impossible d'interrompre votre transmission. *ou* Voulez-vous informer ... *(indicatif d'appel)* qu'il m'a été impossible d'interrompre sa transmission [sur ... kHz (*ou* MHz).
QSJ	Quelle est la taxe à percevoir pour ... y compris votre taxe intérieure?	Le taxe à percevoir pour ... est de ... francs, y compris ma taxe intérieure.
QSK	Pouvez-vous m'entendre entre vos signaux? Dans l'affirmative puis-je vous interrompre dans votre transmission?	Je peux vous entendre entre mes signaux; vous pouvez interrompre ma transmission.
QSL	Pouvez-vous me donner accusé de réception?	Je vous donne accusé de réception.
QSM	Dois-je répéter le dernier télégramme que je vous ai transmis (*ou* un télégramme précédent)?	Répétez le dernier télégrame que vous m'avez transmis [*ou* le(s) télégramme(s) numéro(s) ...].
QSN	M'avez-vous entendu [*ou* avez-vous entendu ...*(indicatif d'appel)*] sur... kHz (*ou* MHZ)?	Je vous ai entendu [*ou* j'ai endentu ...*(indicatif d'appel)*] sur... kHz (*ou* MHZ).
QSO	Pouvez-vous communiquer avec ... directement (*ou* par relais)?	Je suis communiquer avec ... directement (*ou* par l'intermédiaire de ...).
QSP	Voulez-vous retransmettre à ... gratuitement?	Je peux retransmettre à ... gratuitement.
QSR	Avez-vous à bord un médicin [*ou ... (nom d'une personne)*]?	J'ai à bord un médicin [*ou ... (nom d'une personne)*].
QST	Dois-je répéter l'appel sur la fréquence d'appel?	Répétez l'appel sur la fréquence d'appel. Je ne vous ai pas entendu (*ou* il y a eu du brouillage).
QSS	Quelle fréquence de travail allez-vous utiliser?	Je vais utiliser la fréquence de travail ... kHz *(en régle générale, il suffira d'indiquer les trois derniers chiffres de la fréquence).*
QSU	Dois-je (transmettre ou répondre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHZ)] (en émission de la classe ...)?	Transmettez ou répondez sur la fréquence actuelle [*ou* sur ...kHz [*ou* MHz)] (en émission de la classe ...).
QSV	Dois-je transmettre une série de V sur cette fréquence [*ou* sur ... kHz (*ou* MHz)]?	Transmettez une série de V sur cette fréquence [*ou* sur ... kHz (*ou* MHz)].
QSW	Voulez-vous transmettre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...)?	Je vais transmettre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...).
QSX	Voulez-vous écouter ... *(indicatif d'appel)* sur ... kHz (*ou* MHz)?	J'écoute ... *(indicatif d'appel)* sur ... kHz (*ou* MHz).
QSY	Dois-je passer à la transmission sur une autre fréquence?	Passez à la transmission sur une autre fréquence [*ou* sur ... kHz (*ou* MHz)].
QSZ	Dois-je transmettre chaque mot ou groupe plusieurs fois?	Transmettez chaque mot ou groupe deux fois (*ou* ... fois).
QTA	Dois-je annuler le télégramme numéro ...?	Annulez le télégramme numéro ...
QTB	Etes-vous d'accord avec mon compte de mots?	Je ne suis pas d'accord avec votre compte de mots. Je vais répéter la première lettre de chaque mot et le premier chiffre de chaque nombre.
QTC	Combien avez-vous de télégrammes à transmettre?	J'ai ... télégrammes pour vous (*ou* pour ...).
QTD	Qu'à repêché le navire de sauvetage ou l'aéronef de sauvetage?	... (*identifications*) a repêché ...: 1. ... *(nombre)* survivants; 2. Épave; 3. ... *(nombre)* cadavres.
QTE	Quel est mon relèvement VRAI relativement à vous? *ou* Quel est mon relèvement VRAI relativement à ... *(indicatif d'appel)*? *ou* Quel est le relèvement VRAI de ... *(indicatif d'appel)* relativement à ... *(indicatif d'appel)*?	Votre relèvement VRAI relativement à moi est de ... degrés à ... heures. *ou* Votre relèvement VRAI relativement à ... *(indicatif d'appel)* était de ... degrés à ... heures. *ou* Le relèvement VRAI de ... *(indicatif d'appel)* relativement à ... *(indicatif d'appel)* était de ... degrés à ... heures.
QTF	Voulez-vous m'indiquer la position de ma station résultant des relèvements pris par les stations radiogoniométriques que vous contrôlez?	La position de votre station résultant des relèvements pris par les sations radiogoniométriques que je contrôle était ... latitude, ... longitude *(ou une outre indication de la position)*, classe ... à ... heures.
QTG	Voulez-vous transmettre deux traits de dix secondes chacun, suivis de votre indicatif d'appel (répétés ... fois) [sur ... kHz (*ou* MHz)]? *ou* Voulez-vous demander à ... de transmettre deux traits de dix secondes suivis de son indicatif d'appel (répétés ... fois) sur ... kHz (*ou* MHz)?	Je vais transmettre deux traits de dix secondes chacun, suivis de mon indicatif d'appel (répétés ... fois) [sur ... kHz (*ou* MHZ)]. *ou* J'ai demandé à ... de transmettre deux traits de dix secondes suivis de son indicatif d'appel (répétés ... fois) sur ... kHz (*ou* MHz).
QTH	Quelle est votre position en latitude et en longitude *(ou d'après toute autre indications)?*	Ma position est ... latitude ... longitude *(ou d'après toute autre indication).*
QTI	Quelle est votre route VRAIE?	Ma route VRAIE est de ... degrés.
QTJ	Quelle est votre vitesse de marche? *(Demande la vitesse du navire ou de l'aéronef par rapport à l'eau ou à l'air respectivement.)*	Ma vitesse de marche est de ... nœuds (*ou* de ... kilomètres à l'heure, *ou* de ... milles terrestres à l'heure). *(Indique la vitesse du navire ou de l'aéronef par rapport à l'eau ou à l'air respectivement.)*
QTK	Quelle est la vitesse de votre aéronef par rapport à la surface de la terre?	La vitesse de mon aéronef est de ... nœuds (*ou* de ... kilomètres à l'heure, *ou* de ... milles terrestres à l'heure) par rapport à la surface de la terre.
QTL	Quel est votre cap VRAI?	Mon cap VRAI est de ... degrés.

Abréviation	Question	Réponse ou avis
QTM	Quel est votre cap MAGNÉTIQUE?	Mon cap MAGNÉTIQUE est de ... degrés.
QTN	A quelle heure avez-vous quitté ... *(lieu)*?	J'ai quitté ... *(lieu)* à ... heures.
QTO	Etes-vous sorti du bassin (*ou* du port)? *ou* Avez-vous décollé?	Je suis sorti du bassin (*ou* du port). *ou* J'ai décollé.
QTP	Allez-vous entrer dans le bassin (*ou* dans le port)? *ou* Allez-vous amérir (*ou* atterrir)?	Je vais entrer dans le bassin (*ou* dans le port). *ou* Je vais amérir (*ou* atterrir).
QTQ	Pouvez-vous communiquer avec ma station à l'aide du Code international de signaux?	Je vais communiquer avec votre station à l'aide du Code international de signaux.
QTR	Quelle est l'heure exacte?	L'heure exacte est ...
QTS	Voulez-vous transmettre votre indicatif d'appel aux fins de réglage, ou pour permettre la mesure de votre fréquence, maintenant (*ou* à ... heures) sur ... kHz (*ou* MHz)?	Je vais transmettre mon indicatif d'appel aux fins de réglage ou pour permettre la mesure de ma fréquence, maintenant (*ou* à ... heures) sur ... kHz (*ou* MHz).
QTT	—	Le signal d'identification qui suit est superposé à une autre émission.
QTU	Quelles sont les heures pendant lesquelles votre station est ouverte?	Ma station est ouverte de ... à ... heures.
QTV	Dois-je prendre la veille à votre place sur la fréquence ... kHz (*ou* MHz) (de ... à ... heures)?	Prenez la veille à ma place sur la fréquence ... kHz (*ou* MHz) (de ... à ... heures).
QTW	Quel est l'état des survivants?	Les survivants sont en ... état et ont besoin d'urgence ...
QTX	Voulez-vous laisser votre station ouvert pour communiquer avec moi jusqu'à nouvel avis de ma part (*ou* jusqu'à ... heures)?	Ma station reste ouverte pour communiquer avec vous jusqu'à nouvel avis de votre part (*ou* jusqu'à ... heures).
QTY	Vous dirigez-vous vers le lieu de l'accident et, dans d'affirmative, quand pensez-vous arriver?	Je me dirige vers le lieu de l'accident et je pense arriver à ... heures *(... date)*.
QTZ	Continuez-vous les recherches?	Je continue les recherches (de ... aéronef, navire, engin de sauvetage, survivants, épave).
QUA	Avez-vous des nouvelles de ... *(indicatif d'appel)*?	Voici des nouvelles de ... *(indicatif d'appel)*.
QUB	Pouvez-vous me donner dans l'ordre, les renseignements concernant: la direction VRAIE et la vitesse du vent au sol; la visibilité, le temps qu'il fait, l'importance, le type, et la hauteur de la base des nuages au-dessus de ... *(lieu d'observations)?*	Voici les renseingnements demandés: ... *(Il convient de préciser les unités utilisées pour les vitesse et les distances.)*
QUC	Quel est le numéro *(ou autre indication)* du dernier message que vous avez reçu de moi [*ou* de ... *(indicatif d'appel)*]?	Le numéro *(ou autre indication)* du dernier message que j'ai reçu de vous [*ou* de ... *(indicatif d'appel)*] est ...
QUD	Avez-vous reçu le signal d'urgence transmis par ... *(indicatif d'appel d'une stations mobile)*?	J'ai reçu le signal d'urgence transmis par ... *(indicatif d'appel d'une station mobile)* à ... heures.
QUE	Pouvez-vous téléphoner en ... *(langue)*, avec un interprète au besoin; dans l'affirmative, sur quelles fréquences?	Je peux téléphoner en ... *(langue)* sur ... kHz (*ou* MHz).
QUF	Avez-vous reçu le signal de détresse émis par ... *(indicatif d'appel d'une station mobile)*?	J'ai reçu le signal de détresse émis par ... *(indicatif d'appel d'une station mobile)* à ... heures.
QUG	Allez-vous être forcé d'amérir (*ou* d'atterrir)?	Je suis forcé d'amérir (*ou* d'atterrir) immédiatement. *ou* Je vais être forcé d'amérir (*ou* d'atterrir) à ... *(position ou lieu)* à ... heures.
QUH	Voulez-vous m'indiquer la pression barométrique actuelle au niveau de la mer?	La pression barométrique actuelle au niveau de la mer est de ... *(unités)*.
QUI	Vos feux de navigation sont-ils allumés?	Mes feux de navigation sont allumés.
QUJ	Voulez-vous m'indiquer la route VRAIE à suivre pour vous atteindre (*ou* pour atteindre ...)?	La route VRAIE à suivre pour m'atteindre (*ou* pour atteindre ...) est de ... degrés à ... heures.
QUK	Pouvez-vous m'indiquer l'état de la mer observé à ... *(lieu ou coordonnées)*?	La mer à ... *(lieu ou coordonées)* est ...
QUL	Pouvez-vous m'indiquer la houle observée à ... *(lieu ou coordonnées)*?	La houle a ... *(lieu ou coordonnés)* est ...
QUM	Pui-je reprendre le travail normal?	On peut prendre le travail normal.
QUN	Prière aux navires dans mon voisinage immédiat *ou* (dans le voisinage de ... latitude, ... longitude) *ou* (dans le voisinage de ...) d'indiquer leurs positions, cap VRAI et vitesse.	Ma position, mon cap VRAI et ma vitesse sont ...
QUO	Dois-je rechercher ... 1. Un aéronef; 2. Un navire; 3. Un engin de sauvetage; (dans le voisinage de ... latitude, ... longitude *(ou d'après toute autre indications)*?	Voulez-vous rechercher ... 1. Un aéronef; 2. Un navire; 3. Un engin de sauvetage; (dans le voisinage de ... latitude, ... longitude *(ou d'après toute indications)*.
QUP	Voulez-vous indiquer votre position par ... 1. Projecteur; 2. Fumée noire; 3. Fusées lumineuses?	Ma position est indiquée par ... 1. Projecteur; 2. Fumée noire; 3. Fusées lumineuses.

Abréviation	Question	Réponse ou avis
QUQ	Dois-je diriger mon projecteur verticalement sur un nuage, d'une manière intermittente si possible, puis diriger ensuite le faisceau sur l'eau (*ou* sur le sol) contre le vent, lorsque l'on verra ou entendra votre aéronef, afin de faciliter votre amérissage *(ou* votre atterrissage*)*?	Prière de diriger votre projecteur verticalement sur un nuage, d'une manière intermittente si possible, puis diriger ensuite le faisceau sur l'eau (*ou* sur le sol) contre le vent, lorsque vous verrez ou entendrez mon aéronef, afin de faciliter mon amérissage (*ou* mon atterrissage).
QUR	Les survivants ont-ils ... 1. Reçu l'equipement de sauvetage; 2. Été recuillis par un navire; 3. Été rejoints par l'équipe de sauvetage au sol?	Les survivants ont ... 1. Reçu l'équipement de sauvetage lancé par ...; 2. Été recueillis par un navire; 3. Été rejoints par l'équipe de sauvetage au sol.
QUS	Avez-vous aperçu des survivants ou des débris? Si oui, à quel endroit?	J'ai aperçu ... 1. Des survivants dans l'eau; 2. Des survivants sur des radeaux; 3. Des débris ou épaves; à ... latitude, ... longitude *(ou d'après toute autre indication).*
QUT	Le lieu de l'accident est-il indiqué?	Le lieu de l'accident est indiqué par ... 1. Brûlot ou bouée fumigène; 2. Balise marine; 3. Produit colorant; 4. ... *(autre dispositif à spècifier).*
QUU	Dois-je diriger le navire ou l'aéronef sur ma position?	Dirigez le navire ou l'aéronef ... *(indicatif d'appel)* ... 1. Sur votre position en transmettant votre indicatif d'appel et des traits prolongés sur ... kHz (*ou* MHz); 2. En transmettant sur ... kHz (*ou* MHz) la route VRAIE pour vous atteindre.
QUW	Etes-vous sur la zone de recherches ... *(symbole ou latitude et longitude)*?	Je suis sur la zone de recherches ...*(désignation).*
QUY	L'emplacement de l'engin de sauvetage a-t-il été balisé?	L'emplacement de l'engin de sauvetage a été balisé à ... heure par...: 1. Brûlot ou bouée fumigène; 2. Balise marine; 3. Produit colorant; 4. ... *(autre dispositif à spécifier).*

B) Liste des abréviations por nature des questions, réponses ou avis

Abréviation	Question	Réponse ou avis
	Nom	
QRA	Quel est nom de votre station?	Le nom de ma station est ...
	Parcours	
QRD	Où allez-vous et d'où venez-vous?	Je vais à ... et je viens de ...
	Position	
QRB	A quelle distance approximative vous trouvez-vous de ma station?	La distance approximative entre nos stations est de ... milles nautiques (*ou* kilomètres).
QTH	Quelle est votre position en latitude et en longitude *(ou d'après toute autre indication)*?	Ma position est ... latitude ... longitude *(ou d'après toute autre indication).*
QTN	A quelle heure avez-vous quitté ... *(lieu)*?	J'ai quitté ... *(lieu)* à ... heures.
	Qualité des signaux	
QRI	Quelle est la tonalité de mon émission?	La tonalité de votre émission est ... 1. Bonne; 2. Variable; 3. Mauvaise.
QRK	Quelle est l'intelligibilité de mes signaux (*ou* des signaux de...)?	L'intelligibilité de vos sugnaux (*ou* des signaux de ...) est ... 1. Mauvaise; 2. Médiocre; 3. Assez bonne; 4. Bonne; 5. Excellente.

Abréviation	Question	Réponse ou avis
		Force des signaux
QRO	Dois-je augmenter la puissance d'émission?	Augmentez la puissance d'émission.
QRP	Dois-je diminuer la puissance d'émission?	Diminuez la puissance d'émission.
QSA	Quelle est la force de mes signaux (*ou* des signaux de ...)?	La force de vos signaux (*ou* des signaux de ...) est ... 1. À peine perceptible; 2. Faible; 3. Assez bonne; 4. Bonne; 5. Très bonne.
QSB	La force de mes signaux varie-t-elle?	La force de vos signaux varie.
	Manipulation	
QRQ	Dois-je transmettre plus vite?	Transmettez plus vite (... mots par minute).
QRR	Etes-vous prêt pour l'emploi des appareils automatiques?	Je suis prêt pour l'emploi des appareils automatiques. Transmettez à la vitesse de ... mots par minute.
QRS	Dois-je transmettre plus lentement?	Transmettez plus lentement (... mots par minute).
QSD	Ma manipulation est-elle défectueuse?	Votre manipulation est défectueuse.
	Brouillage	
QRM	Etes-vous brouillé?	Je suis brouillé ... 1. Je ne sui nullement brouillé; 2. Faiblement; 3. Modérément; 4. Fortement; 5. Très fortement.
QRN	Etes-vous troublé par des parasites?	Je suis troublé par des parasites ... 1. Je ne suis nullement troublé par des parasites; 2. Faiblement; 3. Modérément; 4. Fortement; 5. Très fortement.
	Réglage de la fréquence	
QRG	Voulez-vous m'indiquer ma fréquence exacte (*ou* la fréquence exacte de ...)?	Votre fréquence exacte (*ou* la fréquence exacte de ...) est ... kHz (*ou* MHz).
QRH	Ma fréquence varie-t-elle?	Votre fréquence varie.
QTS	Voulez-vous transmettre votre indicatif d'appel aux fins de réglage, ou pour permettre la mesure de votre fréquence, maintenant (*ou* à ... heures) sur ... kHz (*ou* MHZ)?	Je vais transmettre mon indicatif d'appel aux fins de réglage ou pour permettre da mesure de ma fréquence, maintenant (*ou* à ... heures) sur ... Khz (*ou* MHZ).
	Choix de la fréquence et ou de la classe d'émission	
QSN	M'avez-vous entendu [*ou* avez-vous entendu ... *(indicatif d'appel)*] sur ... kHz (*ou* MHz)?	Je vous ai entendu [*ou* j'ai entendu ... *(indicatif d'appel)*] sur ... kHz (*ou* MHz).
QSS	Quelle fréquence de travail allez-vous utiliser?	Je vais utiliser la fréquence de travail ... kHz *(en règle générale, il suffira d'indiquer les trois derniers chiffres de la fréquence).*
QSU	Dois-je transmettre ou répondre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...)?	Transmettez ou répondez sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz) (en émission de la classe ...).
QSV	Dois-je transmettre une série de V sur cette fréquence [*ou* sur ... kHz (*ou* MHz)]?	Transmettez une série de V sur cette fréquence [*ou* sur ...kHz (*ou* MHz)].
QSW	Voulez-vous transmettre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...)?	Je vais transmettre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...).
QSX	Voulez-vous écouter ... *(indicatif d'appel)* sur ... kHz (*ou* MHz)?	J'écoute ... *(indicatif d'appel)* sur ... kHz (*ou* MHz).
	Changement de fréquence	
QSY	Dois-je passer à la transmition sur une autre fréquence?	Passez à la transmission sur une autre fréquence [*ou* sur ... kHz (*ou* MHz)].
	Établissement de la communication	
QRL	Etes-vous occupé?	Je sui occupé (*ou* Je suis occupé avec ...). Prière de ne pas brouiller.
QRV	Etes-vous prêt?	Je suis prêt.
QRX	A quel moment me rappellerez-vous?	Je suis rappellerai à ... heures [sur ... kHz (*ou* MHz)].
QRY	Quel est mon tour *(concerne les communications)*?	Le numéro de votre tour est ... *(ou d'après toute autre indication) (concerne les communications).*

Abréviation	Question	Réponse ou avis
QRZ	Par qui suis-je appelé?	Vous êtes appelé par ... [sur ... kHz (*ou* MHz)].
QSC	Etes-vous un navire de charge?	Je suis un navire de charge.
QSR	Dois-je répéter l'appel sur la fréquence d'appel?	Répétez l'appel sur la fréquence d'appel. Je ne vous ai pas entendu (*ou* il y a eu du brouillage).
QTQ	Pouvez-vous communiquer avec ma station à l'aide du Code international de signaux?	Je vais communiquer avec votre station à l'aide du Code international de signaux.
QUE	Pouvez-vous téléphoner en ... *(langue)*, avec un interprète au besoin; dans l'affirmative, sur quelles fréquences?	Je peux téléphoner en ... *(langue)* sur ... kHz (*ou* MHz).
	Heure	
QTR	Quelle est l'heure exacte?	L'heure exacte est ...
QTU	Quelles sons les heures pendant lesquelles votre station est ouverte?	Ma station est ouverte de ... à ... heures.
	Taxes	
QRC	Par quelle exploitation privée (*ou* administration d'État) son liquidés les comptes de taxes de votre station?	Les comptes de taxes de ma station sont liquidés par l'exploitation privée ... (*ou* par l'administration de l'État ...).
QSJ	Quelle est la taxe à percevoir pour ... y compris votre taxe intérieure?	La taxe à percevoir pour ... est de ... francs, y compris ma taxe intérieure.
	Transit	
QRW	Dois-je aviser ... que vous l'appelez sur ... kHz (*ou* MHz)?	Prière d'aviser ... que je l'appelle sur ... kHz (*ou* MHz).
QSO	Pouvez-vous communiquer avec ... directement (*ou* par relais)?	Je suis communiquer avec ... directement (*ou* par l'intermédiaire de ...).
QSP	Voulez-vous retransmettre à ... gratuitement?	Je peux retransmettre à ... gratuitement.
QSQ	Avez-vous à bord un médicin [*ou ... (nom d'une personne)*]?	J'ai à bord un médicin [*ou ... (nom d'une personne)*].
QUA	Avez-vous des nouvelles de ... *(indicatif d'appel)*?	Voici des nouvelles de ... *(indicatif d'appel)*.
QUC	Quel est le numéro *(ou autre indication)* du dernier message que vous avez reçu de moi [*ou* de ... *(indicatif d'appel)*]?	Le numéro *(ou autre indication)* du dernier message que j'ai reçu de vous [*ou* de ... *(indicatif d'appel)*].
	Acheminement de la correspondance	
QRJ	Combien d'appels radiotéléphoniques avez-vous en instance?	J'ai ... appels radiotéléphoniques en instance.
QRU	Avez-vous quelque chose pour moi?	Je n'ai rien pour vous.
QSG	Dois-je transmettre ... télégrammes à la fois?	Transmettez ... télégrammes à la fois.
QSI	—	Il m'a été impossible d'interrompre votre transmission. *ou* Voulez-vous informer ... *(indicatif d'appel)* qu'il m'a été impossible d'interrompre sa transmission [sur ... kHZ (*ou* MHz)].
QSK	Pouvez-vous m'entendre entre vos signaux? Dans l'affirmative puis-je vous interrompre dans votre transmission?	Je peux entendre entre mes signaux; vous pouvez interrompre ma transmission.
QSL	Pouvez-vous me donner accusé de réception?	Je vous donne accusé de réception.
QSM	Dois-je répéter le dernier télégramme que je vous ai transmis (*ou* un télégramme précédent)?	Répétez le dernier télégramme que vous m'avez transmis [*ou* le(s) télégramme(s) numéro(s) ...)].
QSZ	Dois-je transmettre chaque mot ou groupe plusieurs fois?	Transmettez chaque mot ou groupe deux fois (*ou* ... fois).
QTA	Dois-je annuler le télégramme numéro ...?	Annulez le télégramme numéro ...
QTB	Etes-vous d'accord avec mon compte de mots?	Je ne suis pas d'accord avec votre compte de mots. Je vais répéter la première lettre de chaque mot et le premier chiffre de chaque nombre.
QTC	Combien avez-vous de télégrammes à transmettre?	J'ai ... télégrammes pour vous (*ou* pour ...).
QTV	Dois-je prendre la veille à votre place sur la fréquence ... kHz (*ou* MHz) (de ... à ... heures)?	Prenez la veille à ma place sur la fréquence ... kHz (*ou* MHz) (de ... à ... heures).
QTX	Voulez-vous laisser votre station ouverte pour communiquer avec moi jusqu'à nouvel avis de ma part (*ou* jusqu'à ... heures)?	Ma station reste ouverte pour communiquer avec vous jusqu'à nouvel avis de votre part (*ou* jusqu'à ... heures).
	Mouvement	
QRE	A quelle heure comptez-vous arriver à ... (*ou* au-dessus de ...) *(lieu)*?	Je compte arriver à ... (*ou* au-dessus de ...) *(lieu)* à ... heurs.
QRF	Retournez-vous à ... *(lieu)*?	Je retourne à ... *(lieu)*. *ou* Retournez à ... *(lieu)*.
QSH	Pouvez-vous effectuer un ralliement avec votre radiogoniomètre?	Je peux avec mon radiogoniomètre effectuer un ralliement (rallier la station de ...).
QTI	Quelle est votre route VRAIE?	Ma route VRAIE est de ... degrés.
QTJ	Quelle est votre vitesse de marche?	Ma vitesse de marche est de ... nœuds (*ou* de ... kilomètres à l'heure, *ou* de ... milles terrestres à l'heure).
	(Demande la vitesse du navire ou de l'aéronef par rapport à l'eau ou l'air respectivement.)	*(Indique la vitesse du navire ou de l'aéronef par rapport à l'eau ou à l'air respectivement.)*

Abréviation	Question	Réponse ou avis
QTK	Quelle est la vitesse de votre aéronef par rapport à la surface de la terre?	La vitesse de mon aéronef est de ... nœuds (*ou* de ... kilomètres à l'heure, *ou* de ... milles terrestres à l'heure) par rapport à la surface de la terre.
QTL	Quel est votre cap VRAI?	Mon cap VRAI est de ... degrés.
QTM	Quel est votre cap MAGNÉTIQUE?	Mon cap MAGNÉTIQUE est de ... degrés.
QTN	A quelle heure avez-vous quitté ... *(lieu)*?	J'ai quitté ... *(lieu)* à ... heurs.
QTO	Etes-vous sorti du bassin (*ou* du port)?	Je suis sorti du bassin (*ou* du port).
	ou	*ou*
	Avez-vous décollé?	J'ai décollé.
QTP	Allez-vous entrer dans le bassin (*ou* dans le port)?	Je vais entrer dans le bassin (*ou* dans le port).
	ou	*ou*
	Allez-vous amérir (*ou* atterrir)?	Je vais amérir (ou atterrir).
QUG	Allez-vous être forcé d'amérir (*ou* d'atterrir)?	Je suis forcé d'amérir (*ou* d'atterrir) immédiatement.
		ou
		Je vais être forcé d'amérir (*ou* d'atterrir) à ... (*position ou lieu*) à ... heurs.
QUJ	Voulez-vous m'indiquer la route VRAIE à suivre pour vous atteindre (*ou* pour atteindre ...)?	La route VRAIE à suivre pour m'atteindre (*ou* pour m'atteindre ...) est de ... degrés à ... heures.
QUN	Prière aux navires dans mon voisinage immédiat	Ma position, mon cap VRAI et ma vitesse sont ...
	ou	
	(dans le voisinage de ... latitude, ... longitude)	
	ou	
	(dans le voisinage de ...)	
	d'indiquer leurs position, cap VRAI et vitesse.	
	Météorologie	
QUB	Pouvez-vous me donner, dans l'ordre, les renseignements concernant: la direction VRAIE et la vitesse du vent au sol; la visibilité, le temps qu'il fait, l'importance, le type et la hauteur de la base des nuages au-dessus de ... *(lieu d'observation)*?	Voici les renseignements demandés: *(Il convient de préciser les unités utilisées pour les vitesses et les distances.)*
QUH	Voulez-vous m'indiquer la pression barométrique actuelle au niveau de la mer?	La pression barométrique actuelle au niveau de la mer est de ... *(unités)*.
QUK	Voulez-vous m'indiquer l'état de la mer observé à ... *(lieu ou coordonnées)*?	La mer à ... *(lieu ou coordonnées)* est ...
QUL	Pouvez-vous m'indiquer la houle observée à ... *(lieu ou coordonnées)*?	La mer à ... *(lieu ou coordonnées)* est ...
	Radiogoniométrie	
QTE	Quel est mon relèvement VRAI relativement à vous?	Votre relèvement VRAI relativement à moi est de ... degrés à ... heures
	ou	*ou*
	Quel est mon relèvement VRAI relativement à ... *(indicatif d'appel)*?	Votre relèvement VRAI relativement à ... *(indicatif d'appel)* était de ... degrés à ... heures
	ou	*ou*
	Quel est le relévement VRAI de ... *(indicatif d'appel)* relativement à ... *(indicatif d'appel)*?	Le relèvement VRAI de ... *(indicatif d'appel)* relativement à ... *(indicatif d'appel)* était de ... degrés à ... heures.
QTF	Voulez-vous m'indiquer la position de ma station résultant des relèvements pris par les stations radiogoniométriques que vous contrôlez?	La position de v otre station résultant des relèvements pris par les stations radiogoniométriques que je contrôle, était ... latitude, ... longitude *(ou une autre indication de la position)*, classe ... à ... heures.
QTG	Voulez-vous transmettre deux traits de dix secondes chacun, suivis, de votre indicatif d'appel (répétés ... fois) [sur ... kHz (*ou* MHz)]?	Je vais transmettre deux traits de dix secondes chacun, suivis de mon indicatif d'appel (répété ... fois) [sur ... kHz (*ou* MHz)].
	ou	*ou*
	Voulez-vous demander à ... de transmettre deux traits de dix secondes suivis de son indicatif d'appel (répétés ... fois) sur ... kHz (*ou* MHz)?	J' ai demandé à ... de transmettre deux traits de dix secondes suivis de son indicatif d'appel (répétés ... fois) sur ... kHz (*ou* MHz).
	Suspension du travail	
QRT	Dois-je cesser la transmission?	Cessez la transmission.
QUM	Puis-je reprendre le travail normal?	On peut reprendre le travail normal.
	Urgence	
QUD	Avez-vous reçu le signal d'urgence transmit par ... *(indicatif d'appel d'une station mobile)*?	J'ai reçu le signal d'urgence transmis par ... *(indicatif d'appel d'une station mobile)* à ... heures.
QUG	Allez-vous être forcé d'amérir (*ou* d'atterrir)?	Je suis forcé d'amérir (*ou* d'atterrir) immédiatement.
		ou
		Je vais être forcé d'amérir (*ou* d'atterrir) à ... *(position ou lieu)* à ... heures.

Abréviation	Question	Réponse ou avis
	Détresse	
QUF	Avez-vous reçu le signal de détresse émis par ... *(indicatif d'appel d'une station mobile)*?	J'ai reçu le signal de détresse émis par ... *(indicatif d'appel d'une station mobile)* à ... heures.
QUM	Puis-je reprendre le travail normal?	On peut reprendre le travail normal.
	Recherche et sauvetage	
QSE	Quelle est la dérive estimée de l'engin de sauvetage?	La dérive estimée de l'engin de sauvetage est ... *(chiffre et unité)*.
QSF	Avez-vous effectué le sauvetage?	J'ai effectué le sauvetage et je me dirige sur la base de ... (avec ... blessés nécessitant ambulance).
QTD	Qu'a repêché le navire de sauvetage ou l'aéronef de sauvetage?	... *(identification)* a repêché: 1. ... *(nombre)* survivants; 2. Épave; 3. ... *(nombre)* cadavres.
QTW	Quel est'état des survivants?	Les survivants son en ... était et ont besoin d'urgence ...
QTY	Vous dirigez-vous vers le lieu de l'accident et, dans l'affirmative, quand pensez-vouz arriver?	Je me dirige vers le lieu de l'accident et je pense arriver à ... heures (... date).
QTZ	Continuez-vous les recherches?	Je continue les recherches (de ... aéronef, navire, engin de sauvetage, survivants, épave).
QUI	Vos feux de navigation sont-ils allumés?	Mes feux de navigation sont allumés.
QUN	Prière aux navire dans mon voisinage immédiat *ou* (dans le voisinage de ... latitude, ... longitude). *ou* (dans le voisinage de ...) d'indiquer leurs position, cap VRAI et vitesse.	Ma position, mon cap VRAI et ma vitesse sont ...
QUO	Dois-je rechercher: 1. Un aéronef; 2. Un navire; 3. Un engin de sauvetage; dans le voisinage de ... latitude, ... longitude *(ou d'après toute autre indication)*?	Voulez-vous rechercher: 1. Un aéronef; 2. Un navire; 3. Un engin de sauvetage; dans le voisinage de ... latitude, ... longitude *(ou d'après toute autre indication)*.
QUP	Voulez-vous indiquer votre position par ... 1. Projecteur; 2. Fumée noire; 3. Fusées lumineuses?	Ma position est indiquer par ... 1. Projecteur; 2. Fumée noir; 3. Fusées lumineuses.
QUQ	Dois-je diriger mon projecteur verticalement sur un nuage, d'une manière intermittente si possible, puis diriger ensuite le faisceau sur l'eau (*ou* sur le sol) contre le vent, lorsque l'on verra ou entendra votre aéronef, afin de faciliter votre amérissage (*ou* votre atterrissage)?	Prière diriger votre projecteur verticalement sur un nuage, d'une manière intermittente si possible, puis diriger ensuite le faisceau sur l'eau (*ou* sur le sol) contre le vent, lorsque vous verrez ou entendrez mon aéronef, afin de faciliter mons amérissage (*ou* mon atterrissage).
QUR	Les survivants ont-ils: 1. Reçu l'équipement de sauvetage; 2. Été recueillis par un navire; 3. Été rejoints par l'équipe de sauvetage ao sol?	Les survivants ont: 1. Reçu l'équipement de sauvetage lancé par ... 2. Été recueillis par un navire; 3. Été rejoints par l'équipe de sauvetage au sol.
QUS	Avez-vous aperçu des survivants ou des débris? Si oui, à quel endroit?	J'ai aperçu: 1. Des survivants dans l'eau; 2. Des survivants sur des radeaux; 3. Des débris ou épaves; à ... latitude, ... longitude *(ou d'après toute autre indication)*.
QUT	Le lieu de l'accident est-il indiqué?	Le lieu de l'accident est indiqué par: 1. Brûlot ou bouée fumigène; 2. Balise marine; 3. Produit colorant; 4. ... *(autre dispositif à spécifier)*.
QUU	Dois-je diriger la navire ou l'aéronef sur ma position?	Dirigez le navire ou l'aéronef ... *(indicatif d'appel)* ... 1. Sur votre position en transmettant votre indicatif d'appel et des traits prolongés sur ... kHz (*ou* MHz): 2. En transmettant sur ... kHz (*ou* MHz) la route VRAIE por vous atteindre.
QUW	Etes-vous sur la zone de recherches *(symbole ou latitude et longitude)*?	Je suis sur la zone de recherches ...*(désignation)*.
QUY	L'emplacement de l'engin de sauvetage a-t-il été balisé?	L'emplacement de l'engin de sauvetage a été balisé à ... heures par ... 1. Brûlot ou bouée fumigène; 2. Balise marine; 3. Produit colorant; 4. ... *(autre dispositif à spécifier)*.
	Identification	
QTT	–	Le signal d'identification qui suit est superposé à une autre émission.

SECTION II

Abréviations et signaux divers

Abréviation ou signal	Définition
AA	Tout après ... *(à employer après un point d'interrogation pour demander une répétition).*
AB	Tout avant ... *(à employer après un point d'interrogation pour demander une répétition).*
ADS	Adresse *(à employer après un point d'interrogation pour demander une répétition).*
$\overline{AR}$	Fin de transmission (. — . — . *à transmettre comme un seul signal).*
$\overline{AS}$	Attente (. — . . . *à transmettre comme un seul signal).*
BK	Signal employé pour interrompre une transmission en cours.
BN	Tout entre ... et ... *(à employer après un point d'interrogation pour demander une répétition).*
BQ	Réponse à RQ.
CFM	Confirmez (*ou* Je confirme).
CL	Je ferme ma station.
COL	Collationnez (*ou* Je collattione).
CP	Appel général à deux ou à plusieurs stations spécifiées *(voir l'article 52).*
CQ	Appel général à toutes les stations *(voir l'article 52).*
$\overline{CS}$	Indicatif d'appel *(employé pour demander un indicatif d'appel).*
$\overline{DDD}$	Utilisé pour identifier la transmission d'un message de détresse par une station qui n'est pas elle-même en détresse (*voir le numéro* **3164**).
DE	De *(utilisé devant l'indicatif d'appel de la station appelante).*
DF	Votre relèvement à ... heures était ... degrés, dans le secteur douteux de cette station, avec une erreur possible de ... degrés.
DO	Relèvement douteux. Demandez un relèvement plus tard (*ou* à ... heures).
E	Est (point Cardinal).
ER	Ici ...
ETA	Heure estimée d'arrivée.
ITP	La ponctuation compte.
K	Invitation à transmettre.
KMH	Kilomètres à l'heure.
KTS	Milles marins à l'heure *(nœuds).*
MIN	Minute (*ou* Minutes).
MPH	Milles terrestres à l'heure.
MSG	Préfixe indiquant un message à destination ou en provenance du commandant d'un navire et concernant l'exploitation du navire ou sa navigation.
N	Nord (point cardinal).
NIL	Je n'ai rien à vous transmettre.
NO	Non *(négation).*
NW	Maintenant.
OK	Nous sommes d'accord (*ou* C'est correct).
OL	Lettre transocéanique.
P	Préfixe indiquant un radiotélégrame privé.
PBL	Préambule *(à employer après un point d'interrogation pour demander une répétition).*
R	Reçu.
REF	Référence à ... (*ou* Référez-vous à ...).
RPT	Répétez (*ou* Je répéte) (*ou* Répétez ...).
RQ	Indication d'une demande.
S	Sud (point cardinal).
SIG	Signature (*à employer après un point d'interrogation pour demander une répétition*).
SLT	Lettre radiomaritime.
$\overline{SOS}$	Signal de détresse (. . . — — — . . . *à transmettre comme un seul signal).*
SS	Indication précédent le nom d'une station de navire.
SVC	Préfixe indiquant un télégramme de service.
SYS	Référez-vous à votre télégramme de service.
TFC	Trafic.
TR	Utilisé par une station terrestre pour demander la position et le prochain port d'escale d'une station mobile (*voir le numéro* **3691**); utilisé également comme préfixe à la réponse.
TTT	Ce groupe, lorsqu'il est transmis trois fois, constitue le signal de sécurité (*voir le numéro* **3221**).
TU	Je vous remercie.
TXT	Texte *(à employer après un point d'interrogation pour demander une répétition).*
$\overline{VA}$	Fin de travail (. . . — . — *à transmettre comme un seul signal).*
W	Ouest (point cardinal).
WA	Mot après ... *(à employer après un point d'interrogation pour demander une répétition).*
WB	Mot avant ... *(à employer après un point d'interrogation pour demander une répétition).*
WD	Mot(s) *ou* Groupe(s).
XQ	Préfixe indiquant une communication établie dans le service fixe.
XXX	Ce groupe, lorsqu'il est transmis trois fois, constitue le signal d'urgence (*voir le numéro* **3196**).
YES	Oui *(affirmation).*

NOC AP13A

APPENDICE 14

Abréviations et signaux divers à employer dans les radiocommunications du service mobile maritime

(Voir les articles 37, 63 et 65)

SECTION I

Code Q

Introduction

1. Les séries de groupes mentionnées dans les présent appendice vont de QOA à QUZ.

2. Les séries QOA à QQZ sont réservées au service mobile maritime.

3. On peut donner un sens affirmatif ou négatif à certaines abréviation du code Q en transmettant immédiatement après l'abréviation, la lettre C ou les lettres NO (en radiotéléphonie, mot de code CHARLIE ou prononciation NO).

4. La signification des abréviations du code Q peut être étendue ou complétée par l'adjonction appropriée d'autres abréviations, d'indicatifs d'appel, de noms de lieux, de chiffres, de numéros, etc. Les espaces en blanc contenus entre parenthèses correspondent à des indications facultatives. Ces indications sont transmises dans l'ordre où elles se trouvent dans le texte des tables ci-après.

5. Les abréviations du code Q prennent la forme de questions quand elles sont suivies d'un point d'interrogation en radiotélégraphie et de RQ (ROMEO QUEBEC) en radiotéléphonie. Quand une abréviation employée comme question est suivie d'indications additionnelles ou complémantaires, il convient de placer de point d'interrogation ou l'abréviation RQ après ces indications.

6. Les abréviations du code Q qui comportent plusieurs significations numérotées sont suivies du numéro approprié qui précise le sens choisi. Ce numéro est transmis immédiatement après l'abréviation.

7. Les heures sont indiquées en Temps universel coordonné (UTC) à moins d'indications contraires dans les questions ou réponses.

8. Un astéristique (*) placé à la suite d'une abréviation du code Q signifie que ce signal a une signification analogue à celle d'un signal qui figure dans le Code international de signaux.

Abréviations utilisables dans le service mobile maritime

A) Liste des abréviations par ordre alphabétique

Abréviation	Question	Réponse ou avis
QOA	Pouvez-vous communiquer en radiotélégraphie (500 kHz)?	Je peux communiquer en radiotélégraphie (500 kHz).
QOB	Pouvez-vous communiquer en radiotéléphonie (2182 kHz)?	Je peux communiquer en radiotéléphonie (2182 kHz).
QOC	Pouvez-vous communiquer en radiotéléphonie (voie 16 — fréquence 156,80 MHz)?	Je peux communiquer en radiotéléphonie (cote 16 — fréquence 156,80 MHz).
QOD	Pouvez-vous communiquer avec moin en: 0. Néerlandais? 1. Anglais? 2. Français? 3. Allemand? 4. Grec? 5. Italien? 6. Japonais? 7. Norvégien? 8. Russe? 9. Espagnol?	Je peux communiquer avec vous en: 0. Néerlandais; 1. Anglais; 2. Français; 3. Allemand; 4. Grec; 5. Italien; 6. Japonais; 7. Norvégien; 8. Russe; 9. Espagnol.
QOE	Ave-vous reçu le signal de sécurité transmis par ... *(nom ou indicatif d'appel, ou les deux)?*	J'ai reçu le signal de sécurité transmis par ... *(nom ou indicatif d'appel, ou les deux).*
QOF	Quelle est la qualité commerciale de mes signaux?	La qualité de vos signaux est: 1. Non commerciale; 2. Tout juste commerciale; 3. Commerciale.
QOG	Combien de bandes avez-vous à transmettre?	J'ai ... bandes à transmettre.
QOH	Dois-je émettre un signal de mise en phase pendant ... secondes?	Emettez un signal de mise en phase pendant ... secondes.
QOI	Dois-je transmettre ma bande?	Transmettez votre bande.
QOJ	Voulez-vous écouter sur la fréquence ... kHz (*ou* MHz) des signaux de radiobalises de localisation des sinistres?	J'écoute sur la fréquence ... kHz (*ou* MHz) des signaux de radiobalises de localisation des sinistres.
QOK	Avez-vous reçu sur la fréquence ... kHz (*ou* MHz) les signaux d'une radiobalise de localisation des sinistres?	J'ai reçu sur la fréquence ... kHz (*ou* MHz) les signaux d'une radiobalise de localisation des sinistres.

Abréviation	Question	Réponse ou avis
QOL	Votre navire peut-il recevoir les appels sélectifs? Dans l'affirmative, quel est son numéro ou signal d'appel sélectif?	Mon navire peut recevoir les appels sélectifs; son numéro ou signal d'appel sélectif est ...
QOM	Quelles sont les fréquences à utiliser pour qu'un appel sélectif parvienne á votre navire?	La ou les fréquences à ulitiliser pour un appel sélectif sont les suivantes ... (le cas échéant, indiquer en outre les périodes de temps appropriées).
QOT	Entendez-vous mon appel? Quelle est à peu près la durée (en minutes) pendant laquelle je dois attendre avant que nous puissions échanger du trafic?	J'entends votre appel; l'attente est approximativement de ... minutes.
QRA	Quel est le nom de votre navire (*ou* de votre station)?	Le nom de mon navire (*ou* de ma station) est ...
QRB	A quelle distance approximative vous trouvez-vous de ma station?	La distance approximative entre nos stations est de ... milles marins (*ou* kilomètres).
QRC	Par quelle exploitation privée (*ou* administration d'État) sont liquidés les comptes de taxes de votre station?	Les comples de taxes de ma station sont liquidés par l'exploitation privée ... (*ou* par l'administration de l'État ...).
QRD	Où allez-vous et d'où venez-vous?	Je vais à ... et je viens de ...
QRE	A quelle heure comptez-vous arriver à ... (*ou* au-dessus de ...) *(lieu)*?	Je compte arriver à ... (*ou* au-dessus de ...) *(lieu)* à ... heures.
QRF	Retournez-vous à ... *(lieu)*?	Je retourne à ... *(lieu) ou* retournez à ... *(lieu)*.
QRG	Voulez-vous m'indiquer ma fréquence exacte (*ou* la fréquence exacte de ...)?	Votre fréquence exacte (*ou* la fréquence exacte de ...) kHz (*ou* MHz).
QRH	Ma fréquence varie-t-elle?	Votre fréquence varie.
QRI	Quelle est la tonalité de mon énisssion?	La tonalité de votre émissions est ... 1. Bone; 2. Variable; 3. Mauvaise.
QRJ	Combien de demandes de conversation radiotéléphonique avez-vous en instance?	J'ai ... demandes de converstation radiotélephonique en instance.
QRK	Quelle est l'intelligibilité de ma transmission (*ou* de la transmission de ... *(nom ou indicatif d'appel ou les deux)*)?	L'intelligibilité de votre transmission [*ou* de la transmission de ... *(nom ou indicatif dáppel ou les deux)*] est ... 1. Mauvaise; 2. Médiocre; 3. Assez bonne; 4. Bonne; 5. Excellente.
QRL	Êtes-vous occupé?	Je suis ocupé [*ou* je suis occupé avec ... *(nom ou indicatif d'appel ou les deux)*]. Prière de ne pas brouiller.
QRM	Mon émission est-elle brouillée?	Votre énission est brouillée: 1. Votre émission n'est nullement brouillée; 2. Faiblement; 3. Modérément; 4. Fortement; 5. Très fortement.
QRN	Êtes-vous gêné par des parasites?	Je suis gêné par des parasites: 1. Je ne suis nullement gêné par des parasites; 2. Faiblement; 3. Modérémente; 4. Fortement; 5. Très fortement.
QRO	Dois-je augmenter la puissance d'énission?	Augmentez la puissance d'émission.
QRP	Dois-je diminuer la puissance d'émission?	Diminuez la puissance d'émission.
QRQ	Dois-je transmettre plus vite?	Transmettez plus vite (... mots par minute).
QRR	Etes-vous prêt pour l'emploi des appareils automatiques?	Je suis prêt pour l'emploi des appareils automatiques. Transmettez à la vitesse de ... mots par minute.
QRS	Dois-je transmettre plus lentement?	Transmettez plus lentement (... mots par minute).
QRT	Dois-je cesser la transmission?	Cessaz la transmission.
QRU	Avez-vous quelque chose pour moi?	Je n'ai rien pour vous.
QRV	Etes-vous prêt?	Je suis prêt.
QRW	Dois-je aviser ... que vous l'appelez sur ... kHz (*ou* MHz)?	Prière d'aviser ... que je l'appelle sur ... kHz (*ou* MHz).
QRX	A quel moment me rappellerez-vous?	Je vous rappellerai à ... heures sur ... kHz (*ou* MHz).
QRY	Quel est mon tour? *(concerne les communications)*.	Le numéro de votre tour est ... *(ou d'après toute autre indication) (concerne les communications)*.
QRZ	Par qui suis-je appelé?	Vous êtes appelé par ... [sur ... kHz (*ou* MHz)].
QSA	Quelle est la force de mes signaux [*ou* des signaux de ... *(nom ou indicatif d'appel ou les deux)*]?	La force de vos signaux [*ou* des signaux de ... *(nom ou indicatif d'appel ou les deux)*] est: 1. À peine perceptible; 2. Faible; 3. Assez bonne; 4. Bonne; 5. Très bonne.

Abréviation	Question	Réponse ou avis
QSB	La force de mes signaux varie-t-elle?	La force de vos signaux varie.
QSC	Etes-vous une station de navire à faible trafic?	Je suis une station de navire à faible trafic.
QSD	Mes signaux sont-ils mutilés?	Vos signaux sont mutilés.
QSE *	Quelle est la dérive estimée de l'engin de sauvetage?	La dérive estimée de l'engin de sauvetage est ... *(chiffres et unité).*
QSF *	Avez-vous eflectué le sauvetage?	J'ai effectué le sauvetage et je me dirige sur la base de ... (avec ... blessés nécessitant ambulance).
QSG	Dois-je transmettre ... télégrammes à la fois?	Transmettez ... télégrammes à la fois.
QSH	Pouvez-vous eflectuer un ralliement avec votre radiogoniomètre?	Je peux effectuer un ralliement [rallier ... *(nom ou indicatif d'appel ou les deux)*] avec mon radiogoniomètre.
QSI	—	Il m'a été impossible d'interrompre votre transmission. *ou* Voulez-vous informer ... *(nom ou indicatif d'appel ou les deux)* qu'il m'a été impossible d'interrompre sa transmission [sur ... kMz (*ou* MHz)].
QSJ	Quelle est la taxe à percevoir pour ... y compris votre taxe intérieure?	La taxe à percevoir pour ... est de ... francs, y compris ma taxe intérieure.
QSK	Pouvez-vous m'entendre entre vos signaux? Dans l'affirmative, puis-je interrompre votre transmission?	Je peux vous entendre entre mes signaux; vous pouvez interrompre ma transmission.
QSL	Pouvez-vous me donner accusé de réception?	Je vous donne accusé de réception.
QSM	Dois-je répéter le dernier télégramme que je vous ai transmis (ou un télégramme précédent)?	Répétez le dernier télégramme que vous m'avez transmis [*ou* le(s) télegramme(s) numéro(s) ...].
QSN	M'avez-vous entendu [*ou* avez-vous entendu ... *(nom ou indicatif d'appel ou les deux) sur ... kHz (ou MHz)*]?	Je vous ai entendu [*ou* j'ai entendu ... *(nom ou indicatif d'appel ou les deux)* sur ... kHz (*ou* MHz)].
QSO	Pouvez-vous communiquer avec ... *(nom ou indicatif d'appel ou les deux)* directement (*ou* par relais)?	Je peux communiquer avec ... *(nom ou indicatif d'appel ou les deux)* directement (*ou* par relais par l'intermédiaire de ...).
QSP	Voulez-vous retransmettre à ... *(nom ou indicatif d'appel ou les deux)* gratuitement?	Je vais retransmettre à ... *(nom ou indicatif d'appel ou les deux)* gratuitement.
QSQ	Avez-vous à bord un médecin [*ou ... (nom d'une personne)*]?	J'ai à bord un médecin [*ou ... (nom d'une personne)*].
QSR	Dois-je répéter l'appel sur la fréquence d'appel?	Répétez l'appel sur la fréquence d'appel. Je ne vous ai pas entendu (*ou* il y a eu du brouillage).
QSS	Quelle fréquence de travail allez-vous utiliser?	Je vais utilizer la fréquence de travail ... kHz (*ou* MHz) *(en onde décamétriques, il suffira en règle générale d'indiquer les trois derniers chiffres de la fréquence).*
QSU	Dois-je transmettre ou répondre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...)?	Transmettez ou répondez sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...).
QSV	Dois transmettre une série de V (*ou* de signaux) pour réglage sur cette fréquence [*ou* sur ... kHz (*ou* MHz)]?	Transmettez une série de V (*ou* de signaux) pour réglage sur cette fréquence [(*ou* sur ... kHz (*ou* MHz)].
QSW	Voulez-vous transmettre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...)?	Je vais transmettre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...).
QSX	Voulez-vous écouter ... *(nom ou indicatif d'appel ou les deux)* sur ... kHz (*ou* MHz) ou dans les bandes ... voies ...?	J'écoute ... *(nom ou indicatif d'appel ou les deux)* sur ... kHz (*ou* MHz) ou dans les bandes ... voies ...
QSY	Dois-je passer à la transmission sur une autre fréquence?	Passez á la transmission sur une autre fréquence [*ou* sur ... kHz (*ou* MHz)].
QSZ	Dois-je transmettre chaque mot ou groupe plusieurs fois?	Transmettez chaque mot ou groupe deux fois (*ou* ... fois).
QTA	Dois-je annuler le télégramme (*ou* le message) numéro ...?	Annuelez le télégramme (*ou* le messsage) numéro ...
QTB	Êtes-vous d'accord avec mon compte de mots?	Je ne suis pas d'accord avec votre compre de mots. Je vais répéter la première lettre de chaque mot et le premier chiffre de chaque nombre.
QTC	Combien avez-vous de télégrammes à transmettre?	J'ai ... télégrammes pour vous [*ou* pour ... *(nom ou indicatif d'appel ou les deux)*].
QTD *	Qu'a repêché le navire de sauvetage *ou* l'aéronef de sauvetage?	... *(identification)* a repêché: 1. ... *(nombre)* survivants; 2. Épave; 3. ... *(nombre)* cadavres.
QTE	Quel est mon relèvement VRAI relativement à vous? *ou* Quel est mon relèvement VRAI relativement à ... *(nom ou indicatif d'appel ou les deux)*? *ou* Quel est relèvement VRAI de ... *(nom ou inclicatif d'appel ou les deux)* relativement à ... *(nom ou indicatif d'appel ou les deux)*?	Votre relèvant VRAI relativement à moi est de ... degrés à ... heures. *ou* Votre relèvement VRAI relativement à ... *(nom ou indicatif d'appel ou les deux)* était de ... degrés à ... heures. *ou* Le relèvement VRAI de ... *(nom ou indicatif d'appel ou les deux)* relativement à ... *(nom ou indicatif d'appel ou les deux)* était de ... degrés à ... heures.
QTF	Voulez-vous m'indiquer ma position résultant des relèvements pris par les stations radiogoniométriques que vous contrôler?	Votre position résultant des relèvements pris par les stations radiogoniométriques que je contrôle était ... latitude, ... longitude *(ou une autre indication de la position),* classe ... à ... heures.
QTG	Voulez-vous transmettre deux traits de dix secondes chacun (*ou* la porteuse pendant deux périodes de dix secondes), puis votre indicatif d'appel (*ou* votre nom) (répétés ... fois) sur ... kHz (*ou* MHz) *ou* Voulez-vous demander à ... *(nom ou indicatif d'appel ou les deux)* de transmettre deux traits de dix secondes (*ou* la porteuse pen-	Je vais transmettre deux traits de dix secondes chacun (*ou* la porteuse pendant deux périodes de dix secondes), puis mon indicatif d'appel (*ou* mon nom), (répétés ... fois) sur ... kHz (*ou* MHz). *ou* J'ai demandé à ... *(nom ou indicatif d'appel ou les deux)* de transmettre deux traits de dix secondes (*ou* la porteuse pendant

Abréviation	Question	Réponse ou avis
	dant deux périodes de dix secondes) puis son indicatif d'appel (*ou* son nom *ou les deux*) répétés ... fois) sur ... kHz (ou MHz)?	deux périodes de dix secondes), puis son indicatif d'appel (*ou* son nom *ou les deux*) (répétés ... fois) sur ... kMz (*ou* MHz).
QTH	Quelle est votre position en latitude et en longitude *(ou d'après toute autre indication)*?	Ma position est ... latitude ... longitude *(ou d'après toute autre indication)*.
QTI *	Quelle est votre route VRAIE?	Ma route VRAIE est de ... degrés.
QTJ *	Quelle est votre vitesse de marche?	Ma vitesse de marche est de ... nœuds (*ou* de ... kilomètres à l'heure, *ou* de ... milles terrestres à l'heure).
	(Demande la vitesse du navire ou de l'aéronef par rapport à l'eau ou à l'air respectivement.)	*(Indique la vitesse du navire ou de l'aéronef par rapport à l'eau ou à l'air respectivement.)*
QTK *	Quelle est la vitesse de votre aéronef par rapport à la surface de la terre?	La vitesse de mon aéronef est de ... nœuds (*ou* de ... kilomètres à l'heure, *ou* de ... milles terrestres à l'heure) par rapport à la surface de la terre.
QTL *	Quel est votre cap VRAI?	Mon cap VRAI est de ... degrés.
QTM *	Quel este votre cap MAGNÉTIQUE?	Mon cap MAGNÉTIQUE est de ... degrés.
QTN	A quelle heure avez-vous quitté ... *(lieu)*?	J'ai quitté ... *(lieu)* à ... heures.
QTO	Etes-vous sorti du bassin (*ou* du port)? *ou* Avez-vous décollé?	Je suis sorti du bassin (*ou* du port). *ou* J'ai décollé.
QTP	Allez-vous entrer dans le bassin (*ou* dans le port)? *ou* Allez-vous amérir (*ou* atterrir)?	Je vais entrer dans le bassin (*ou* dans le port). *ou* Je vais amérir (*ou* atterrir).
QTQ	Pouvez-vous communiquer avec ma station à l'aide du Code international de Signaux (INTERCO)?	Je vais communiquer avec votre station à l'arde du Code internationale de Signaux (INTERCO).
QTR	Quelle est l'heure exacte?	L'heure exacte est ...
QTS	Voulez-vous transmettre votre indicatif d'appel (*ou* votre nom, *ou les deux*) pendant ... secondes?	Je vais transmettre mon indicatif d'appel (ou mon nom *ou les deux*) pendant ... secondes.
QTT	—	Le signal d'identification qui suit est superposé á une autre émission.
QTU	Quelles sont les heures pendant lesquelles votre station est ouverte?	Ma station est ouverte de ... à ... heures.
QTV	Dois-je prendre la veille à votre place sur la fréquence ... kHz (*ou* MHz) (de ... à ... heures)?	Prenez la veille à ma place sur la fréquence ... à ... kHz (*ou* MHz) de ... heures).
QTW *	Quel est l'état des survivants?	Les survivants sont en ... état et ont d'urgence besoin de ...
QTX	Voulez-vous laisser votre station ouverte pour communiquer avec moi jusqu'à nouvel avis de ma part (*ou* jusqu'à ... heures)?	Ma station reste ouverte pour communiquer avec vous jusqu'à nouvel avis de votre part (*ou* jusqu'à ... heures).
QTY *	Vous dirigez-vous ver le lieu de l'accident et, dans l'affirmative, quand pensez-vous arriver?	Je me dirige vers le lieu de l'accident et je pense arriver à ... heures (... *date*).
QTZ *	Continuez-vous les recherches?	Je continue les recherches (de ... aéronef, navire, engin de sauvetage, survivants, épave).
QUA	Avez-vous des nouvelles de ... *(nom ou indicatif d'appel ou les deux)*?	Voici des nouvelles de ... *(nom ou indicatif d'appel ou les deux)*.
QUB	Pouvez-vous me donner dans l'ordre, les renseignements concernant: la direction VRAIE et la vitesse du vent au sol; la visibilité, le temps qu'il fait, l'importance, le type et la hauteur de la base des nuages au-dessus de ... *(lieu d'observation)*?	Voici les renseignements demandés ... *(Il convient de préciser les unités utilisées pour les vitesses et les distances.)*
QUC	Quel est le numéro *(ou autre indication)* du dernier message que vous avez reçu de moi [*ou* de ... *(nom ou indicatif d'appel ou les deux)*]?	Le numéro *(ou autre indication)* du dernier message que j'ai reçu de vous [*ou* de ... *(nom ou indicatif d'appel ou les deux)*] est ...
QUD	Avez-vous reçu le signal d'urgence émis par ... *(nom ou indicatif d'appel ou les deux)*?	J'ai reçu le signal d'urgence émis par *(nom ou indicatif d'appel ou les deux)* à ... heures.
QUE	Pouvez-vous converser en ... *(langue)*, au besoin avec un interprète: dans l'affirmative, sur quelles fréquences?	Je peux converser en ... *(langue)* sur ... kHz (ou MHz).
QUF	Avez-vous reçu le signal de détresse émis par ... *(nom ou indicatif d'appel ou les deux)*?	J'aile signal de détresse émis par ... *(nom ou indicatif d'appel* ou *les deux)* à ... heures.
QUH *	Voulez-vous m'indiquer la pression barométrique actuelle au niveau de la mer?	La pression barométrique actueile au niveau de la mer est de ... *(unités)*.
QUM	Puis-je reprendre le travail normal?	On peut reprendre le travail normal.
QUN	1. *Posée à toutes les stations:* Les navires dans mon voisinage immédiat *ou* (dans le voisinage de ... latitude, ... longitude) *ou* (dans le voisinage de ...) peuvent-ils m'indiquer leur position, cap VRAI et vitesse? 2. *Pasée à une seule station:* Veuillez indiquer votre position, cap VRAI et vitesse?	Ma position, mon cap VRAI et ma vitesse sont ...
QUO *	Dois-je rechercher: 1. Un aéronef; 2. Un navire; 3. Un engin de sauvetage;	Veuillez rechercher: 1. Un aéronef; 2. Un navire; 3. Un engin de sauvetage;

Abréviation	Question	Réponse ou avis
	dans le voisinage de ... latitude, ... longitude *(ou d'après toute autre indication)*?	dans le voisinage de ... latitude, ... longitude *(ou d'après toute autre indication).*
QUP *	Voulez-vous indiquer votre position par ... 1. Projecteur? 2. Fumée noire? 3. Fusées lumineuses?	Ma position est indiquée par ... 1. Projecteur; 2. Fumée noire; 3. Fusées lumineuses.
QUR *	Les survivants ont-ils ... 1. Reçu l'équipement de sauvetage; 2. Été recueillis par un navire; 3. Été rejoints par l'équipe de sauvetage au sol?	Les survivants ont ... 1. Reçu l'équipement de sauvetage lancé par ... 2. Été recueillis par un navire; 3. Été rejoints par l'équipe de sauvetage au sol.
QUS *	Avez-vous aperçu des survivants ou des débris? Si oui, à quel endroit?	J'ai aperçu: 1. Des survivants dans l'eau; 2. Des survivants sur des radeaux; 3. Des débris ou épaves à ... latitude, ... longitude *(ou d'aprés toute autre indication).*
QUT *	Le lieu de l'accident est-il indiqué?	Le lieu de l'accident est indiqué par: 1. Brûlot ou boueé fumigène; 2. Balise marine; 3. Produit colorant; 4. ... *(autre dispositif à spécifier).*
QUU *	Dois-je diriger le navire ou l'aéonef sur ma position?	Dirigez le navire ou l'aéronef ... *(nom ou indicatif d'appel ou les deux):* 1. Sur votre position en transmettant votre indicatif d'appel et des traits prolongés sur ... kHz (*ou* MHz); 2. En transmettant sur ... kHz (ou MHz) la route VRAIE pour vous atteindre.
QUW *	Etes-vous sur la zone des recherches ... *(symbole ou latitude et longitude)*?	Je suis sur lá zone de recherches ... *(désignation).*
QUX	Avez-vous en instance des avis relatifs à la navigation ou à une tempête?	J'ai en instance l'avis (les avis) suivant(s) relatif(s) à la navigation ou à une tempête.
QUY *	L'emplacement de l'engin de sauvetage a-t-il été balisé?	L'emplacement de l'engin de sauvetage a été balisé à ... heures par: 1. Brûlot ou bouée fumigéne; 2. Balise marine; 3. Produit colorant; 4. ... *(autre dispositif à spécifier).*
QUZ	Puis je reprendre un travial restreint?	Procédure de détresse encore en vi gueur, un travail restreint peut être repris.

B) Liste des abréviations par nature des questions, rèponses ou avis

Abréviation	Question	Réponse ou avis
	Nom	
QRA	Quel est le nom de votre navire (*ou* de votre station)?	Le nom de mon navire (*ou* ma station) est ...
	Parcours	
QRD	Où allez-vous et d'où venez-vous?	Je vais à ... et je viens de ...
	Position	
QRB	A quelle distance approximative vous trouvez-vous de ma station?	La distance approximative entre nos stations est de ... milles marins (*ou* kilomètres).
QTH	Quelle est votre position en latitude et en longitude *(ou d'après toute autre indication)*?	Ma position est ... latitude ... longitude *(ou d'après toute autre indication).*
QTN	A quelle heure avez-vous quitté ... *(lieu)*?	J'ai quitté ... *(lieu)* à ... heures.
	Qualité des signaux	
QOF	Quelle est la qualité commerciale de mes signaux?	La qualité de vos signaux est: 1. Non commerciale; 2. Tout juste commerciale; 3. Commerciale.

Abréviation	Question	Réponse ou avis
QRI	Quelle est la tonalité de mon émission?	La tonalité de votre émission est ... 1. Bonne; 2. Variable; 3. Mauvaise.
QRK	Quelle est l'intelligibilité de ma transmission [*ou* de la transmission de ... *(nom ou indicatif d'appel ou les deux)*]?	L'intelligibilité de votre transmission [*ou* de la transmission de ... *(nom ou indicatif d'appel ou les deux)*] est ... 1. Mauvaise; 2. Médiocre; 3. Assez bonne; 4. Bonne; 5. Excelente.
	Force des signaux	
QRO	Dois-je augmenter la puissance d'émission?	Augmentez la puissance d'émission.
QRP	Dois-je diminuer la puissance d'émission?	Diminuez la puissance d'émission.
QSA	Quelle est la force de mes signaux [*ou* des signaux de ... *(nom ou indicatif d'appel ou les deux)*]?	La force de vos signaux [*ou* des signaux de ... *(nem ou indicatif d'appel ou les deux)*] est ... 1. À peine perceptible; 2. Faible; 3. Assez bonne; 4. Bonne; 5. Très bonne.
QSB	La force de mes signaux variet-t-elle?	La force de vos signaux varie.
	Manipulation	
QRQ	Dois-je transmettre plus vite?	Transmettez plus vite (... mots par minute).
QRR	Etes-vous prêt pour l'emploi des appareils automatiques?	Je suis prêt pour l'emploi des appareils automatiques. Transmettez à la vitesse de ... mots par minute.
QRS	Dois-je transmettre plus lentement?	Transmettez plus lentement (... mots par minute).
QSD	Mes signaux sont-ils mutilés?	Vos signaux sont mutilés.
	Brouillage	
QRM	Mon émission est-elle brouillée?	Votre émission est brouillée: 1. Votre émission n'est nullemente brouillé; 2. Faiblement; 3. Modérément; 4. Fortement; 5. Très fortement.
QRN	Etes-vous gêne par des parasites?	Je suis gêné par des paraistes ... 1. Je ne suis nullement gêné par des parasites; 2. Faiblement; 3. Modérément; 4. Fortement; 5. Très fortement.
	Réglage de la fréquence	
QRG	Voulez-vous m'indiquer ma fréquence exacte (*ou* la fréquence exacte de ...)?	Votre fréquence exacte (*ou* la fréquence exacte de ...) est ... kHz (*ou* MHz).
QRH	Ma fréquence varie-t-elle?	Votre fréquence varie.
QTS	Voulez-vous transmettre votre indicatif d'appel (*ou* votre nem *ou les deux*) pendant ... secondes?	Je vais transmettre mon indicatif d'appel (*ou* mon nom *ou les deux*) pendant ... secondes.
	Choix de la fréquence et ou de la classe d'émission	
QSN	M'avez-vous entendu (*ou* avez-vous entendu ... *(nom ou indicatif d'appel ou les deux)* sur ... kHz (*ou* MHz)?	Je vous ai entendu [*ou* j'ai entendu ... *(nom ou indicatif d'appel ou les deux)* sur ... kHz (*ou* MHz)].
QSS	Quelle fréquence de travail allez-vous utiliser?	Je vais utiliser la fréquence de travail ... kHz (*ou* MHz) *(en ondes décamétriques, il suffira en règle générale d'indiquer les trois derniers chiffres de la fréquence).*
QSU	Dois-je transmettre ou répondre sur la fréquence actuelle (*ou* sur ... kHz (*ou* MHz) (en émission de la classe ...)?	Transmettez ou répondez sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...).
QSV	Dois-je transmettre une série de V (*ou* de signaux) pour réglage sur cette fréquence [*ou* sur ... kHz (*ou* MHz)]?	Transmettez une série de V (*ou* de signaux) pour réglage sur cette fréquence [*ou* sur ... kHz (*ou* MHz)].
QSW	Voulez-vous transmettre sur la fréquence actuelle [*ou* sur ... kMz (*ou* MHz)] (en émission de la classe ...)?	Je vais transmettre sur la fréquence actuelle [*ou* sur ... kHz (*ou* MHz)] (en émission de la classe ...).
QSX	Voulez-vous écouter ... *(nom ou indicatif d'appel ou les deux)* sur kMz (*ou* MHz) ou dans les bandes ... voies ...	J'écoute ... *(nom ou indicatif d'appel ou les deux)* sur ... kHz (*ou* MHz) ou dans les bandes ... voies ...

Abréviation	Question	Réponse ou avis
	Changement de fréquence	
QSY	Dois-je passer à la transmission sur une autre fréquence?	Passez à la transmission sur une autre fréquence [*ou* sur ... kHz (*ou* MHz)].
	Établissement de la communication	
QOA	Pouvez-vous communiquer en radiotélégraphie (500 kHz)?	Je peux communiquer en radiotélégraphie (500 kHz).
QOB	Pouvez-vous communiquer en radiotéléphonie (2182 kHz)?	Je peux communiquer en radiotéléphonie (2182 kHz).
QOC	Pouvez-vous communiquer en radiotéléphonie (voie 16–fréquence 156,80 MHz)?	Je peux communiquer en radiotéléphonie (voie 16 — fréquence 156,80 MHz).
QOD	Pouves-vous communiquer avec moi en: 0. Néerlandais? 1. Anglais? 2. Français? 3. Allemand? 4. Grec? 5. Italien? 6. Japonais? 7. Norvégien? 8. Russe? 9. Espagnol?	Je peux communiquer avec vous en: 0. Néerlandais; 1. Anglais; 2. Français; 3. Allemand; 4. Grec; 5. Italien; 6. Japonais; 7. Norvégien; 8. Russe; 9. Espagnol.
QOT	Entendez-vous mon appel? Quelle est à peu près la durée (en minutes) pendant laquelle je dois attendre avant que nous puissions échanger du trafic?	J'entends votre appel. L'attente est approximativement de ... minutes.
QRL	Etes-vous occupé?	Je suis occupé [*ou* je suis occupé avec ... *(nom ou indicatif d'appel ou les deux)*]. Prière de ne pas brouiller.
QRV	Etes-vous prêt?	Je suis prêt.
QRX	A quel moment me rappellerez-vous?	Je vous rappellerai à ... heures sur ... kHz (*ou* MHz).
QRY	Quel est mon tour? *(concerne les communications).*	Le numéro de votre tour est ... *(ou d'après toute autre indication) (concerne les communications).*
QRZ	Par qui suis-je appelé?	Vous êtes appelé par ... [sur ... kHz (*ou* MHz)].
QSC	Etes-vous une station de navire à faible trafic?	Je suis une station de navire à faible trafic.
QSR	Dois-je répéter l'appel sur la fréquence d'appel?	Répétez l'appel sur la fréquence d'appel. Je ne vous ai pas entendu (*ou* il y a eu du brouillage).
QTQ	Pouvez-vous communiquer avec ma station à l'aide du Code international de Signaux (INTERCO)?	Je vais communiquer avec votre station à l'aide du Code international de Signaux (INTERCO).
QUE	Pouvez-vous converser en ... *(langue)*, au besoin avec un interprète; dans l'affirmative, sur quelles fréquences?	Je peux converser en ... *(langue)* sur ... kHz (*ou* MHz).
	Appels sélectifs	
QOL	Votre navire peut il recevoir les appels sélectifs? Dans l'affirmative, quel est son numéro ou signal d'appel sélectif?	Mon navire peut recevoir les appels sélectifs; son numéro ou signal d'appel sélectif est ...
QOM	Quelles sont les fréquences à utiliser pour qu'un appel sélectif parvienne a votre navire?	La ou les fréquences à utiliser pour un appel sélectif sont les suivantes ... (le cas écheant, indiquer en outre les périodes de temps appropriées).
	Heure	
QTR	Quelles est l'heure exacte?	L'heure exacte est ...
QTU	Quelles sont les heures pendant lesquelles votre station est ouverte?	Ma station est ouvert de ... à ... heures.
	Taxes	
QRC	Par quelle exploitation privée (*ou* administration d'État) sont liquidés les comptes de taxes de votre station?	Les comptes de taxes de ma station sont liquidés par l'exploitation privée ... (*ou* par l'administration de l'État ...).
QSJ	Quelle est la taxe à percevoir pour ... y compris votre taxe intérieure?	La taxe à percevoir pour ... este de ... francs, y compris ma taxe intérieure.
	Transit	
QRW	Dois-je aviser ... que vous l'appelez sur ... kHz (*ou* MHz)?	Prière d'aviser ... que je l'appelle sur ... kHz (*ou* MHz).
QSO	Pouvez-vous communiquer avec ... *(nom ou indicatif d'appel ou les deux)* directement (*ou* par relais)?	Je peux communiquer avec ... *(nom ou indicatif d'appel ou les deux)* directement (*ou* par relais par l'intermédiaire de ...).
QSP	Voulez-vous retransmettre à ... *(nom ou indicatif d'appel ou les deux)* gratuitement?	Je vais retransmettre ... *(nom ou indicatif d'appel ou le deux)* gratuitement.
QSQ	Avez-vous à bord un médecin [*ou* ... *(nom d'une personne)*]?	J'ai á bord un médecin [*ou* ... *(nom d'une personne)*].
QUA	Avez-vous des nouvelles de ... *(nom ou indicatif d'appel ou les deux)*?	Voici des nouvelles de ... *(nom ou indicatif d'appel ou les deux).*
QUC	Quel est le numéro *(ou autre indication)* du dernier message que vous avez reçu de moi [*ou* de ... *(nom ou indicatif d'appel ou les deux)*]?	Le numéro *(au autre indication)* du dernier message que j'ai reçu de vous [*ou* de ... *(nom ou indicatif d'appel ou les deux)*] est ...
	Acheminement de la correspondance	
QOG	Combien de bandes avez-vous à transmettre?	J'ai ... bandes à transmettre.
QOH	Dois-je émettre un signal de mise en phase pendant ... secondes?	Emettez un signal de mise en phase pendant ... secondes.

Abréviation	Question	Réponse ou avis
QOI	Dois-je transmettre ma bande?	Transmettez votre bande.
QRJ	Combien de demandes de conversation radiotéléphonique avez-vous en instance?	J'ai ... demandes de conversation radiotéléphonique en instance.
QRU	Avez-vous quelque chose pour moi?	Je n'ai rien pour vous.
QSG	Dois-je transmettre ... télégrammes à la fois?	Transmettez ... télégrammes à la fois.
QSI	—	Il m'a été impossible d'interrompre votre transmission. *ou* Voulez-vous informer ... *(nom ou indicatif d'appel ou les deux)* qu'il m'a été impossible d'interrompre sa transmission [sur ... kHz (*ou* MHz)].
QSK	Pouvez-vous m'entendre entre vos signaux? Dans l'affirmative, puis-je interrompre votre transmission?	Je peux vous entendre entre mes signaux; vous pouvez interrompre ma transmission.
QSL	Pouvez-vous me donner accusé de réception?	Je vous donne accusé de réception.
QSM	Dois-je répéter le dernier télégramme que je vous ai transmis (*ou* un télégramme précedent)?	Répétez le dernier télégramme que vous m'avez transmis [*ou* le(s) télégramme(s) numéro(s)].
QSZ	Dois-je transmettre chaque mot ou groupe plusieurs fois?	Transmettez chaque mot ou groupe deux fois (*ou* ... fois).
QTA	Dois-je annuler le télégramme (*ou* le message) numéro ...?	Annulez le télégramme (*ou* le message) numéro ...
QTB	Etes-vous d'accord avec mon compte de mots?	Je ne suis pas d'accord avec votre compte de mots. Je vais répéter la première lettre de chaque mot et la premier chiffre de chaque nombre.
QTC	Combien avez-vous de télégrammes à transmettre?	J'ai ... télégramme pour vous [*ou* pour ... *(nom ou indicatif d'appel ou les deux)*].
QTV	Dois-je prendre la veille á votre place sur la fréquence ... kHz (*ou* MHz) (de ... à ... heures)?	Prenez la veille à ma place sur la fréquence ... kHz (*ou* MHz) (de ... à ... heures).
QTX	Voulez-vous laisser votre station ouverte pour communiquer avec moi jusqu'à nouvel avis de ma part (*ou* jusqu'à ... heures)?	Ma station reste ouverte pour communiquer avec vous jusqu'à nouvel avis de votre part (*ou* jusqu'à ... heures).
	Mouvement	
QRE	A quelle heure comptez-vous arriver à ... (*ou* au-dessus de ...) *(lieu)*?	Je compte arriver à ... (*ou* au-dessus de ...) *(lieu)* à ... heures.
QRF	Retournez-vous à ... *(lieu)*?	Je retourne à ... *(lieu)* ou retournez à ... *(lieu)*.
QSH	Pouvez-vous effectuer un ralliement avec votre radiogoniomètre?	Je peux effectuer un ralliement [rallier ... *(nom ou indicatif d'appel ou les deux)*] avec mon radiogoniomètre.
QTI *	Quelle est votre route VRAIE?	Ma route VRAIE est de ... degrés.
QTJ *	Quelle est votre vitesse de marche? *(Demande la vitesse du navire ou de l'aéronef á l'eau ou à láir respectivement.)*	Ma vitesse de marche est de ... nœuds (*ou* de ... kilomètres à l'heure, *ou* de ... milles terrestres à l'heure). *(Indique la vitesse du navire ou de l'aéronef par rapprt á l'eau ou à l'air respectivement.)*
QTK *	Quelle est la vitesse de votre aéronef par rapport à la surface de la terre?	La vitesse de mon aéronef est de ... nœuds (*ou* de ... kilomètres á l'heure, *ou* de ... milles terrestres à l'heure) par rapport à la surface de la terre.
QTL *	Quel est votre cap VRAI?	Mon cap VRAI est de ... degrés.
QTM *	Quel est votre cap MAGNÉTIQUE?	Mon cap MAGNÉTIQUE est de ... degrés.
QTN	A quelle heure avez-vous quitté ... *(lieu)*?	J'ai quitté ... *(lieu)* à ... heures.
QTO	Etes-vous sorti du bassin (*ou* du port)? *ou* Avez-vous décollé?	Je suis sorti du bassin (*ou* du port). *ou* J'ai décollé.
QTP	Allez-vous entrer dans le bassin (*ou* dans le port)? *ou* Allez-vous amérir (*ou* atterrir)?	Je vais entrer dans le bassin (*ou* dans le port). *ou* Je vais amérir (*ou* atterrir).
QUN	1. *Posée á toutes les stations:* Les navires dans mon voisinage immédiat *ou* (dans le voisinage de ... latitude, ... longitude) *ou* (dans le voisinage de ...) peuvent-ils m'indiquer leur position, cap VRAI et vitesse? 2. *Posée à une seule station:* Veuillez indiquer votre position, cap VRAI et vitesse?	Ma position, mon cap VRAI et ma vitesse sont ...
	Météorologie	
QUB *	Pouvez-vous me donner dans l'ordre, les renseignements concernant: la direction VRAIE et la vitesse du vent au sol; la visibilité, le temps qu'il fait, l'importance, le type et la hauteur de la base des nuages au-dessus de ... *(lieu d'observation)*?	Voici les renseignements demandés: *(Il convient de préciser les unités utilisées pour les vitesses et les distances.)*
QUH *	Voulez-vous m'indiquer la pression barométrique actuelle au niveau de la mer?	La pression barométrique actuelle au niveau de la mer est de ... *(unités)*.
QUX	Avez-vous en instance des avis relatifs a la navigation ou à une tempête?	J'ai en instance l'avis (les avis) suivant(s) relatif(s) á la navigation ou à une tempête.

Abréviation	Question	Réponse ou avis
	Radiogoniométrie	
QTE	Quel est mon relèvement VRAI relativement à vous?	Votre relèvement VRAI relativement à moi est de ... Jegrés à ... heures.
	ou	*ou*
	Quel est mon relèvement VRAI relativement à ... *(nom ou indicatif d'appel ou les deux)?*	Votre relèvement VRAI relativement à ... *(nom ou indicatif d'appel ou les deux)* était de ... degrés à ... heures.
	ou	*ou*
	Quel est le relèvement VRAI de ... *(nom ou indicatif d'appel ou les deux)* relativement à ... *(nom ou indicatif d'appel ou les deux)*?	Le relèvement VRAI de ... *(nom ou indicatif d'appel ou les deux)* relativement à ... *(nom ou indicatif d'appel ou les deux)* était de ... degrés à ... heures.
QTF	Voulez-vouz m'indiquer ma position résultant des relèvments pris par les stations radiogoniométriques que vous contrôlez?	Votre position résultant des relèvments pris par les stations radiogoniométriques que je contrôle était ... latitude, ... longitude *(ou une outre indication de la position)*, classe ... à ... heures.
QTG	Voulez-vous transmettre deux traits de dix secondes chacun (*ou* la porteuse pendant deux périodes de dix secondes) puis votre indicatif d'appel (*ou* votre nom) (répétés ... fois) sur ... kHz (*ou* MHz)?	Je vais transmettre deux traits de dix secondes chacun (*ou* la porteuse pendant deux périodes de dix secondes) puis mon indicatif d'appel (*ou* mon nom) (répétés ... fois) sur ... kHz (*ou* MHz).
	ou	*ou*
	Voulez-vous demander à ... *(nom ou indicatif d'appel ou les deux)* de transmettre deux traits de dix secondes (*ou* la porteuse pendant deux périodes de dix secondes) puis son indicatif d'appel (*on* son nom *ou les deux*), (répétés ... fois) sur ... kHz (*ou* MHz)?	J'ai demandé à ... *(nom ou indicatif d'appel ou les deux)* de transmettre deux traits de dix secondes (*ou* la porteuse pendant deux périodes de dix secondes) puis son indicatif d'appel *(ou* son nom *ou les deux*) (répétés ... fois) sur ... kHz (*ou* MHz).
	Suspension du travail	
QRT	Dois-je cesser la transmission?	Cesssez la transmission.
QUM	Puis-je reprendre le travail normal?	On peut reprendre le travail normal.
QUZ	Puis-je repreende un travail restreint?	Procédure de détresse encore en viguer, un travail restreint peut être repris.
	Sécurité	
QOE	Avez-vous reçu le signal de sécurité transmis par ... *(nom ou indicatif d'appel, ou les deux)*?	J'ai reçu le signal de sécurité transmis par ... *(nom ou indicatif d'appel, ou les deux).*
QUX	Avez-vous en instance des avis relatifs à la navigation ou à une tempête?	J'ai en instance l'avis (les avis) suivant(s) relatif(s) à la navigation ou à une tempête.
	Urgence	
QUD	Avez-vous reçu le signal d'urgence énis par ... *(nom ou indicatif d'appel ou les deux)*?	J'ai reçu le signal d'urgente énis par ... *(nom ou indicatif d'appel ou les deux)* à ... heures.
	Détresse	
QOJ	Voulez-vous écouter sur la fréquence ... kHz (*ou* MHz) des signaux de radiobalises de localisation des sinistres?	J'écoute sur la fréquence ... kHz (*ou* MHz) des signaux de radiobalises de localisation des sinistres.
QOK	Avez-vous reçu sur la fréquence ... kHZ (ou MHz) les signaux d'une radiobalise de localisation des sinistres?	J'ai reçu sur la fréquence ... kHz (*ou* MHz) les signaux d'une radiobalise de localisation des sinistres.
QUF	Avez-vous reçu le signal de détresse énis par ... *(nom ou indicatif d'appel ou les deux)*?	J'ai reçu le signal de détresse énis par ... *(nom ou inidicatif d'appel ou les deux)* à ... heures.
QUM	Puis-je reprendre le travail normal?	On peut reprendre le travail normal.
QUZ	Puis-je reprendre un travail restreint?	Procédure de détresse encore em vigueur, un travail restreint peut être repris.
	Recherches et sauvetage	
QSE *	Quelle est la dérive estimée de l'engin de sauvetage?	La dérive estimée de l'engin de sauvetage est ...*(chiflres et unité).*
QSF *	Avez-vous effectué le sauvetage?	J'ai effectué le sauvetage et je me dirige sur la base de ... (avec ...blessés necéssitant ambulance).
QTD *	Qu'a repêché le navire sauvetage *ou* l'aéronef de sauvetage?	... (identification) a repêché: 1. ... *(nombre)* survivants; 2. Épave; 3. ... *(nombre)* cadavres.
QTW *	Quel est l'état des survivants?	Les survivants sont en ... état et ont d'urgence besoin de ...
QTY *	Vous dirigez-vous vers le lieu de l'accident et, dans l'affirmative, quand pensez-vous arriver?	Je me dirige vers le lieu de l'accident et je pense arriver à ...heures *(... date).*
QTZ *	Continuez-vous les recherches?	Je continue les recherches (de ... aéronef, navire, engin de sauvetage, survivants, épave).
QUN	1. *Posée à toutes les stations:*	
	Les navires dans mon voisinage immédiat *ou* (dans le voisinage de ... latitude, ... longitude) *ou* (dans le voisinage de ...) peuvent-ils m'indiquer leur position, cap VRAI et vitesse?	Ma position, mon cap VRAI et ma vitesse sont ...

Abréviation	Question	Réponse ou avis
	2. *Posée à une seule station:* Veuillez indiquer votre position, cap VRAI et vitesse?	
QUO *	Dois-je rechercher: 1. Un aéronef; 2. Un navire; 3. Un engin de sauvetage; dans le voisinage de ... latitude, ... longitude *(ou d'après toute autre indication)*?	Veuillez rechercher: 1. Un aéronef; 2. Un navire; 3. Un engin de sauvetage; dans le voisinage de ... latitude, ... longitude *(ou d'après toute autre indication).*
QUP *	Voulez-vous indiquer votre position par: 1. Projecteur? 2. Fumée noire? 3. Fusées lumineuses?	Ma position est indiquée par: 1. Projecteur; 2. Fumée noire; 3. Fusées lumineuses.
QUR *	Les survivants ont-ils: 1. Reçu l'equipement de sauvetage? 2. Été recueillis par un navire? 3. Été rejoints par l'équipe de sauvetage au sol?	Les survivants ont: 1. Reçu l'équipement de sauvetage lancé par ... 2. Été recueillis par un navire; 3. Été rejoints par l'équipe de sauvetage au sol.
QUS *	Avez-vous aperçu des survivants ou des débris? Si oui, à quel endroit?	J'ai aperçu: 1. Des survivants dans l'eau; 2. Des survivants sur des radeaux; 3. Des débris ou épaves à ... latitude, ... longitude *(ou d'aprés toute autre indication).*
QUT *	Le lieu de l'accident est-il indiqué?	Le lieu de l'accident est indiqué par: 1. Brûlot ou bouée fumigène; 2. Balise marine; 3. Produit colorant; 4. ... *(autre dispositif à spécifier).*
QUU *	Dois-je diriger le navire ou l'aéronef sur ma position?	Dirigez le navire ou l'aéronef ... *(nom ou indicatif d'appel ou les deux):* 1) Sur votre position en transmettant votre indicatif d'appel et des traits prolongés sur ... kHz (*ou* MHz); 2) En transmettant sur ... kHz (ou MHz) la route VRAIE pour vous atteindre.
QUW *	Etes-vous sur la zone des recherches ... *(symbole ou latitude et longitude)*?	Je suis sur la zone de recherches ... *(designation).*
QUY *	L'emplacement de l'engin de sauvetage a-t-il été balisé?	L'emplacement de l'engin de sauvetage a été balisé à ... heures par: 1) Brûlot ou bouée fumigéne; 2) Balise marine; 3) Produit colorant; 4) ... *(autre dispositif à spécifier).*
QUZ *	Puis-je reprendre un travail restreint?	Procédure de détresse encore en vigueur, un travail restreint peut être repris.
	Identification	
QTT *	—	Le signal d'identification qui suit est superposé à une autre émission.

SECTION II

Abreviations et signaux divers

Abréviation ou signal	Définition
AA	Tout aprés ... [*à employer après un point d'interrogation en radiotélégraphie ou après RQ en radiotéléphonie (en cas de difficultés de langage) ou après RPT, pour demander une répétition*].
AB	Tout avant ... [*à employer après un point d'interrogation en radiotélégraphie ou après RQ en radiotéléphonie (en cas de difficultés de langage) ou après RPT, pour demander une répétition*].
ADS	Adresse [*à employer après un point d'interrogation en radiotélégraphie ou après RQ en radiotéléphonie (en cas de difficultés de langage) ou après RPT, pour demander une répétition*].
$\overline{AR}$	Fin de transmission.

Abréviation ou signal	Définition
$\overline{AS}$	Attente.
BK	Signal employé pour interrompre une transmission en cours.
BN	Tout entre ... et ... [*à employer après un point d'interrogation en radiotélégraphie ou après RQ en radiotéléphonie (en cas de difficultés de langage) ou après RPT, pour demander une répétition*].
BQ	Réponse à RQ.
$\overline{BT}$	Signal de séparation entre les différentes parties d'une même transmission.
C	Oui *(réponse affirmative), ou bien:* le groupe qui précède fdoit être compris comme une affirmation.
CFM	Confirmez (*ou* Je confirme).
CL	Je ferme ma station.
COL	Collationnez (ou Je collationne).
CORRECTION	Annulez mon dernier mot *ou* groupe, la correction va suivre *(utilisé en radiotéléphonie et prononcé KOR-REX-CHEUNN).*
CP	Appel général à plusieurs stations spécifiées *(voir l'article 63).*
CQ	Appel général à toutes les stations.
CS	Indicatif d'appel *(employé pour demander un indicatif d'appel).*
DE	De *(utilisé devant le nom ou toute autre identification de la station appelante).*
DF	Votre relèvement à ... heures était ... degrés, dans le secteur douteux de cette station, avec une erreur possible de ... degrés.
DO	Relèvement douteux. Demandez un relèvement plus tard (*ou* à ... heures).
E	Est (point cardinal) *(Voir le numéro* 3098).
ETA	Heure estimée d'arrivée.
INTERCO	Des groupes du Code international de Signaux suivent *(utilisé en radiotéléphonie et prononcé IN-TER-CO).*
K	Invitation à transmettre.
$\overline{KA}$	Signal de commencement de transmission.
KTS	Milles marins à l'heure *(nœude).*
MIN	Minute (ou minutes).
MSG	Préfixe indiquant un mesage à destination ou en provenance du commandant d'un navire et concernant l'exploitation du navire ou sa navigation.
N	Nord (point cardinal) *(voir le numéro* 3098).
NIL	Je n'ai rien á vous transmettre.
NO	Non *(négation).*
NW	Mainteant.
NX	Avis aux navigateurs (*ou* Avis aux navigateurs maritimes suit).
OK	Nous sommes d'accord (*ou* C'est correct).
OL	Lettre transocéanique.
P	Préfixe indiquant un radiotélégramme privé.
PBL	Préambule [*à employer après un point d'interrogation en radiotélégraphie ou après RQ en radiotéléphonie (en cas de difficultés de langage) ou après RPT, pour demander une répétition*].
PSE	S'il vous plalt.
R	Reçu.
REF	Référence à ... (*ou* Référez-vous à ...).
RPT	Répétez (*ou* Je répète) (ou Répétez ...).
RQ	Indication d'une demande.
S	Sud (point cardinal) *(voir le numéro* 3098).
SIG	Signature [*à employer après un point d'interrogation en radiotélégraphie ou après RQ en radiotéléphonie (en cas de difficultés de langage) ou aprés RPT, pour demander une répétition*].
SLT	Lettre radiomaritime.
SVC	Préfixe indiquant un télégramme de service.
SYS	Référez-vous á votre télégramme de service.
TFC	Trafic.
TR	Utilisé par une station terrestre pour demander la position et le prochain port d'escale d'une station mobile *(voir les numéros* 4741 *et* 4942; utilisé également comme préfixe à la réponse.
TU	Je vous remercie.
TXT	Texte [*à employer aprés un point d'interrogation en radiotélégraphie ou aprés RQ en radiotéléphonie (en cas de difficultés de langage) ou après RPT, pour demander une répétition*].
$\overline{VA}$	Fin de travail.
W	Quest (point cardinal) *(voir le numéro* 3098).
WA	Mot après ... [*à employer aprés un point d'interrogation en radiotélégraphie ou après RQ en radiotéléphonie (en cas de difficultés de langage) ou après RPT, pour demander une répétition*].
WB	Mot avant ... [*à employer après un point d'interrogation en radiotélégraphie ou après RQ en radiotéléphonie (en cas de difficultés de langage) ou après RPT, pour demander une répétition*].
WD	Mot(s) ou groupe(s).
WX	Bulletin météorologique (*ou* Bulletin météorologique suit).
XQ	Préfixe indiquant la transmission d'une note de service.
YZ	Les mots qui suivent sont en langage clair.

Note. — En radiotélégraphie, un trait horizontal les lettres qui composent um signal signific que ces lettres doivent être transmises comme un seul signal.

NOC **AP14**

APPENDICE 15

Codes SINPO et SINPFEMO

(Voir l'Avis N° 251 du CCIR)

Code SINPO

Échelle	S	I	N	P	O
	Force du signal	Effets nuisibles			Appréciation d'ensemble
		Brouillage	Bruit	Perturbations de la propagation	
5	Excellente.	Nul.	Nul.	Nulles.	Excellent.
4	Bonne.	Léger.	Léger.	Légères.	Bon.
3	Satisfaisante.	Modéré.	Modéré.	Modérées.	Satisfaisant.
2	Médiocre.	Sévère.	Sévère.	Sévères.	Médiocre.
1	A peine audible.	Très grave.	Très grave.	Très graves.	Inutilisable.

Code SINPFEMO

Échelle	S	I	N	P	F	E	M	O
	Force du signal	Effets nuisibles			Fréquence des évanouissements	Modulation		Appréciation d'ensemble
		Brouillage	Bruit	Perturbations de la propagation		Qualité	Taux	
5	Excellente.	Nul.	Nul.	Nulles.	Nulle.	Excellente.	Maximum.	Excellente.
4	Bonne.	Léger.	Léger.	Légères.	Lente.	Bonne.	Bon.	Bon.
3	Satisfaisante.	Modéré.	Modéré.	Modérées.	Modérée.	Satisfaisante.	Satisfasant.	Satisfaisant.
2	Médiocre.	Sévère.	Sévère.	Sévères.	Rapide.	Médiocre.	Médiocre ou nul.	Médiocre.
1	A peine audible.	Très grave.	Très grave.	Très graves.	Très rapide.	Très médiocre.	Surmodulé en permanence.	Inutilisable.

Remarques particulières:

a) Un rapport codé sera formé du mot code SINPO ou SINPFEMO suivi d'un groupe de cinq ou huit chiffres décrivant respectivement les cinq ou huit caractéristiques figurant dans le code correspondant;
b) Pour les caractéristiques qui n'ont pas été évaluées, on utilisera la lettre X au lieu d'un chiffre;
c) Quoique le code SINPFEMO ait été prévu pour la radiotéléphonie, il peut être utilisé pour la radiotélégraphie;

d) L'appréciation d'ensemble, pour la radiotélégraphie, doit être interprétée comme il est indiqué dans les tableaux I et II ci-dessous:

TABLEAU I

Appréciation d'ensemble	Télégraphie automatique
5. Excellent	Multiplex 4 voies par répartition dans le temps.
4. Bon	Multiplex 2 voies par répartition dans le temps.
3. Satisfasant	Presque commercial en système arythmique à une voie.
2. Médiocre	BK, XQ et indicatifs lisibles.
1. Inutilisable	Illisible.

TABLEAU II

Appréciation d'ensemble	Télégraphie Morse
5. Excellent	Grande vitesse.
4. Bon	100 mots/minute.
3. Satisfaisant	50 mots/minute.
2. Médiocre	BK, XQ et indicatifs lisibles.
1. Inutilisable	Illisible.

e) L'évaluation d'ensemble, pour la téléphonie, doit être interprétée comme il est indiqué dans le tableau III:

TABLEAU III

Appréciation d'ensemble	Conditions de réception	Qualité
5. Excellent	Signal sans défaut	Commerciale.
4. Bon	Signal présentant de légers défauts	
3. Passable	Signal présentant de graves défauts. Voie utilisable par des opérateurs ou par des abonnés expérimentés.	Tout juste commerciale.
2. Médiocre	Voie juste utilisable par des opérateurs	Non commerciale.
1. Inutilisable	Voie inutilisable par des opérateurs	

NOC AP 17 Rév.

APPENDICE 16

Voices radiotéléphoniques dans les bandes du service mobile maritime comprises entre 4000 kHz et 23 000 kHz

(Voir l'article 60, section IV)

1. La répartition des voices radiotéléphoniques à utilisser par les stations côtières et les stations de navire dans les bandes attribuées au service mobile maritime est indiquée dans les deux sections ci-après:

Section A — table des fréquences d'emission à bande latérale unique pour l'exploitation duplex (voices à deux fréquences), en kHz;

Section B — table des fréquences d'emission à bande latérale unique pour l'exploitation simplex (voices à une fréquence) et pour l'exploitation à bandes croisées entre navires (deux fréquences), en kHz.

2. Les caractéristiques techinques des émetteurs à bande latérale unique sonto spécifiées à l'appendice 17.

3. Une ou plusieurs séries de fréquences de la section A (à l'exception des fréquences mentionnées au paragraphe 5 ci-dessous) peuvent être assignées à charque station côtière et celle-ci utilise ces fréquences associées par paires (voir le numéro 4381); chaque paire comprend une fréquence d'émission et une fréquence de réception. Les séries doivent être choisies en tenant compte des zones à desservir et de façon à éviter, autant que possible, les brouillages préjudiciables entre les émissions des différentes stations côtières.

4. Les fréquences de la section B sont destinées à être utilisées en commum dans le monde entier par les navires de toutes catégories, compte tenu des besoins du trafic, pour les émissions des navires à destination des stations côtières et les communications entre navires. De plus, elles peuvent être utilisées en commum dans le monde entier pour les émissions des stations côtières (exploitation simplex), sous réserve que la puissance de crête ne dépasse pas 1 kW (voir da Recommandation 304).

5. Les fréquences suivantes de la section A sont attribuées pour l'appel:

Voie N° 421 dans la bande des 4 MHz;
Voie N° 606 dans la bande des 6 MHz;
Voie N° 821 dans la bande des 8 MHz;
Voie N° 1221 dans la bande des 12 MHz;
Voie N° 1621 dans la bande des 16 MHz;
Voie N° 2221 dans la bande des 22 MHz.

Les autres fréquences des sections A et B sont des fréquences de travail.

6:

a) Les stations qui utilisent des émissions à bande latérale unique doivent fonctionner uniquement sur les fréquences porteuses spécifiées dans les sections A et B conformément aux caractéristiques techniques spécifiées à l'appendice 17. Ces stations doivent toujours utiliser la bande latérale supérieure;

b) Les stations qui utilisent des émissions à bande latérale unique doivent faire uniquement des émissions des classes R3E et J3E. Néanmoins, il convient que les administrations s'efforcent, autant que possible, de limiter aux émissions de la classe J3E l'utilisations des voies N^{os} 401, 601, 801, 1201, 1601 et 2201.

7. Si une administration autorise l'emploi de fréquences autres que celles qui sont indiquées dans les sections A et B, ses communications radiotélephoniques ne doivent pas causer de brouillage préjudiciable aux stations radiotéléphoniques du service mobile maritime qui emploient des fréquences spécifiées dand les tables qui suivent.

SECTION

Table des fréquences d'émission à bande latérale unique

Voie numéro	Bande des 4 MHz				Voie numéro	Bande des 6 MHz				Voie numéro	Bande des 8 MHz			
	Stations côtières		Stations de navire			Stations côtières		Stations de navire			Stations côtières		Stations côtières	
	Fréquences porteuses	Fréquences assignées	Fréquences porteuses	Fréquences assignées		Fréquences porteuses	Fréquences assignées	Fréquences porteuses	Fréquences assignées		Fréquences porteuses	Fréquences assignées	Fréquences porteuses	Fréquences assignées

MOD AP17A

APPENDICE 17

Caractéristiques techniques des émetteurs à bande latérale unique utilisés dans le service mobile maritime pour la radiotéléphonie dans les bandes comprises entre 1606,5 (1605 Région 2) kHz et 4000 kHz et entre 4000 kHz et 23 000 kHz

(Voir l'article 60, section IV)

1. Puissance le l'onde porteuse:

a) Pour les émissions de la classe R3E, la puissance de l'onde porteuse est la suivant:

Bandes comprises entre 1606,5 (1605 Région 2) kHz et 4000 kHz:

Émetteurs des stations côtières jusqu'au 1er janvier 1982 et émetteurs des stations de navire en service ou installés avant le 2 janvier 1982: 16 ± 2 dB au-dessous de la puissance en crête de l'emission;

Émeteurs des stations côtières à partir du 1er janvier 1982 et émeteurs des stations de navire installés après le 1er janvier 1982: 18 ± 2 dB au-dessous de la puissance en crête de l'emission;

Bandes comprises entre 4000 kHz et 23 000 kHz:

Émetteurs des stations de navire installés avant le 2 janvier 1978: 16 ± 2 dB au-dessous de la puissance en crête de l'emission;

Émeteurs des stations côtières à partir du 1er janvier 1978 et émetteurs des stations de navire installés après le 1er janvier 1978: 18 ± 2 dB au-dessous de la puissance en crête de l'emission;

b) Pour les émissions de la classe J3E, la puissance de l'onde porteuse est inférieure de 40 dB au moins à la puissance en crête de l'émission.

2. Les stations côtières et les stations de navire doivent émettre dans la bande latérale supérieure seulement.

3. La bande des fréquences acoustiques transmise doit s'étendre de 350 Hz à 2700 Hz, la variation de l'amplitude en fonction de la fréquence ne dépassant pas 6 dB.

4. La fréquence de l'onde porteuse des émetteurs doit être maintenue dans les tolérances ci-après:

a) Stations côtières: ± 20 Hz;

b) Stations de navire:

Bandes comprises entre 1606,5 (1605 Région 2) kHz et 4000 kHz:

Tolérance applicable aux émetteurs installés avant le 2 janvier 1982: ± 100 Hz: la dérive maximale à court terme (de l'ordre de 15 minutes) est de ± 40 Hz;

Tolérance applicable aux émetteurs installés avant le 1er janvier 1982 mais avant le 2 janvier 1985: ± 50 Hz;

Tolérance applicable aux émetteurs installés après le 1er janvier 1985 et à tours les émetteurs à partir du 1er janvier 1990: ± 40 Hz.

Bandes comprises entre 4000 kHz et 23 000 kHz:

Tolérance applicable aux émetteurs installés avant le 2 janvier 1982: ± 100 Hz: la dérive maximale à court terme (de l'ordre de 15 minutes) est de ± 40 Hz;

Tolérance applicable aux émetteurs installés après le 1er janvier 1985 et à tours les émetteurs à partir du 1er janvier 1990: ± 40 Hz.

5. La modulation de fréquence parasite de l'onde porteuse doid être suffisamment faible pour ne pas créer de distorsions nuisibles.

6. Dans le cas d'une émission de la classe H3E, R3E ou J3E, la puissance de toute émission non désirée fournie à la ligne d'alimentation de l'antenne sur une fréquence discrète quelconque doit, lorsque l'emetteur fonctionne à sa puissance en crête maximale, rester dans les limites indiquées dans le tableau suivant:

a) Émetteurs en service ou installés avant le 2 janvier 1982 (1):

Diference Δ entre la fréquence du rayonnement non désiré (*a*) et la fréquence assignée (*b*) (kHz)	Affaiblissement minimum par raport à la puissance en crête
1,6 < Δ ≤ 4,8	28 dB
4,8 < Δ ≤ 8	38 dB
8 < Δ	43 dB, sans que la puissance du rayonnement non désiré puisse dépasser 50 mW.

(*a*) *Rayonnement non désiré* (voir la article 1, numéro **140**).
(*b*) La fréquence assignée est supérieure de 1400 Hz à la fréquence porteuse (voir le numéro **4194**).

En ce qui concerne les émissions hors bande (2) et les rayonnements non essentiels (3) qui résultent du processus de modalution mais qui ne tombent pas dans le spectre des émissions hors bande (2), on peut, lorsqu'on désire vérifier si une émission à onde porteuse réduite ou supprimée satisfait aux condition ci-dessus, appliquer à l'entrée de l'émetteur un signal constitué de deux fréquences acoustiques suffisamment éloignées l'une de l'autre pour que tous les produits d'intermodulation tombent sur des fréquences distantes d'au moins 1,6 kHz de la fréquence assignée:

b) Émetteurs installés après le 1er janvier 1982 (1):

Diference Δ entre la fréquence du rayonnement non désiré (*a*) et la fréquence assignée (*b*) (kHz)	Affaiblissement minimum par raport à la puissance en crête
1,5 < Δ ≤ 4,5	31 dB
4,5 < Δ ≤ 7,5	38 dB
7,5 < Δ	43 dB, sans que la puissance du rayonnement non désiré puisse dépasser 50 mW.

(*a*) *Rayonnement non désiré* (voir la article 1, numéro **140**).
(*b*) La fréquence assignée est supérieure de 1400 Hz à la fréquence porteuse (voir le numéro **4194**).

En ce qui concerne les émissions hors bande (2) et les rayonnements non essentiels(3) qui résultent du processus de modalution mais qui ne tombent pas dans le spectre des émissions hors bande (2), on peut, lorsqu'on désire vérifier si une émission à onde porteuse réduite ou supprimée satisfait aux condition ci-dessus, appliquer à l'entrée de l'émetteur un signal constitué de deux fréquences acoustiques suffisamment éloignées l'une de l'autre pour que tous les produits d'intermodulation tombent sur des fréquences distantes d'au moins 1,5 kHz de la fréquence assignée.

NOC **AP18**

APPENDICE 18

Tableau des fréquences d'émission pour les stations du service mobile maritime dans la bande 156-174 MHz

(Voir le numéro **613** et les articles 59 et 60)

Note 1. — Pour faciliter la compréhension du tableau, voir les remarques *a*) à *q*) ci-après.

Note 2. — Les voies 01 à 28, à l'exception des voies 15 et 17, correspondent aux voies de l'appendice **18** au Règlement des radiocommunications de Genève (1959) et les voies 15, 17 et 60 à 88 représentent les voies supplémentaires disponibles pour les assignations selon les dispositions de l'appendice 18 Mar au Règlement des radiocommunications, Génève (1967) (voir la Résolution **308**).

Note 3. — Les numéros 60 à 88 ont été choisis pour les voices supplémentaires afin de les distinguer nettement des voies existant à l'origine.

---

(1) Toutes les administrations reconnaissent la nécessité de réduire le niveau des émissions non désirées et elles s'efforceront en conséquence de faire en sorte que tous les nouveaux émetteurs dont elles sont responsables soient conformes aux nouvelles caractéristiques dès que possible avant le 2 janvier 1982.
(2) *Emissions hors bande* :(voir l'article 1, numéro **138**).
(3) *Rayonnement non essentiel* (voir l'article 1, numéro **139**).

Numéros des voies	Renvois	Fréquences d'emission (MHz)		Navire-navire	Opérations portuaires		Mouvement des navires		Correspondance publique
		Stations de navire	Stations côtières		Une fréquence	Deux fréquences	Une fréquence	Deux fréquences

Remarques relatives au tableau

(*a*) Les chiffres figurant dans la colonne «Navire-navire» indiquent l'ordre normal dans lequel il convient que les voies soint nises en service par la station mobile.

(*b*) Les chiffres figurant dans les colonnes «Opérations portuaires». «Mouvement des navires» et «Correspondance publique» indiquent l'ordre normal dans lequel il convient que les voies soient mises en service par chaque station côtière, il peut cependant être nécessaire dans certains cas d'omettre des voies afin d'éviter des brouillages préjudiciables entre stations côtières voisines.

(*c*) Les administrations peuvent désigner des fréquences du service navire, du service des operations portuaires ou du service du mouvement des navires, qui pourront être utilisées par des aéronefs légers ou des helicoptéres pour entrer en communication avec des navires ou des stations côtières participant a des opérations de soutien essentiellement maritimes, dans les conditions spécifiées aux numéros **4144, 4148, 4149, 4150, 4151, 4152** et **4153**. Cependant, l'emploi des voies partagées avec le service de correspondance publique dépendra d'un accord préalable entre les administrations intéressées et celles dont les services sont susceptibles d'être défavorablement influencés.

(*d*) Les voies du présent appendice, à l'exception des voies 6, 15, 16, 17, 75 et 76, peuvent aussi être utilisées pour la transmission de données à grande vitesse et de fac-similé, sous réserve d'arrangements particuliers entre les administrations intéressées et celles dont les services sont susceptibles d'être défavorablement influencés.

(*e*) Sauf aux États-Unis d'Amerique, les voies du présent appendice, et de préference deux voies adjacentes des séries 87. 28. 88, peuvent, à l'exception des voies 6, 15, 16, 17, 75 et 76, être utilisées pour les systemes à bande étroite de télégraphie à impression directe et la transmission de données, sous réserve d'arrangements particuliers entre les administrations interessées et celles jount les services sont susceptibles d'être défavorablement influencés.

(*f*) Les voies à deux fréquences attribuées au service des opérations portuaires (18, 19, 20, 21, 22, 79 et 80) peuvent être utilisées pour la correspondance, publique, sous réserve d'arrangements particuliers entre les administrations intéressées et celles dont les services sont susceptibles d'être défavorablement influencés.

(*g*) Jusqu'au 1er janvier 1983, sur les voies 15 et 17, la puissance apparente rayonnée par les emetteurs des stations de navire ne doit pas dépasser 1 watt.

(*h*) La fréquence 156,300 MHz (voies 6) (voir les numéros **2993** et **4154**) peut aussi être utilisée pour les communications entre stations de navire et stations d'aéronef participant à ces opérations coordonnées de recherches et de sauvetage. Les stations de navire doivent éviter de causer des brouillages nuisibles à de telles communications sur la voie 6 ainsi qu'aux communications entre les stations d'aéronef, les brise-glace et les navires assistés par ceux-ci pendant la saison des glaces.

(*i*) En France et en Bélgique, les fréquences 156,050 MHz, 156,150 MHz et 156,175 MHz sont utilisées dans les voies 1, 3 et 63 respectivement, par les stations de navire et dans les voies 21, 23 et 83 respectivement, par les stations côtières, dans le cas de systèmes spéciaux semi-duplex de correspondance publique qui fonctionnent avec une séparation de 1 MHz entre les fréquences d'émission de réception. Ces dispositions particulières cesseront d'être utilisées au plus tard le 1er janvier 1983.

(*j*) Les voies 60 et 88 peuvent être utilisées sous réserve d'arrangements particuliers entre les administrations intéressées et celles dont les services sont susceptibles d'être défavorablement influences.

(*k*) Les fréquences énumérées dans ce tableau peuvent être utilisées également pour les radiocommunications sur les voies d'eau intérieures dans les conditions prévues au numéro **613**.

(*l*) Les voies 15 et 17 peuvent être utilisées pour les communications internes à bord des navires, sous réserve que la puissance apparente rayonnée ne dépasse pas 1 watt, et dans les limites de la réglementation nationale de l'administration intéressée lorsque ces voies sont utilisées dans ses eaux territoriales (voir cependant la Recommendation **305**).

(*m*) Cette bande de garde sera applicable à partir du 1er janvier 1983 (voir les numéros **3033, 3033.1, 4393** et **4393.1**).

(*n*) Dans la Zone européenne maritime et au Canada, ces fréquences (voies 10, 67 et 73) peuvent aussi être utilisées, si besoin est, par les administrations intéressées, pour les communications entre les stations de navire, les stations d'aéronef et les stations terrestres participant a des opérations coordonnées de recherches et de sauvetage ainsi qu'à des opérations de lutte contre la pollution dans des zones locales, dans les conditions spécifiées aux numéros **4144, 4148, 4149, 4150, 4151, 4152** et **4153**.

(*o*) Les trois premières fréquences à utiliser de préférence, pour l'emploi indiqué dans la Remarque *c*), sont 156,450 MHz (voie 9), 156,525 MHz (voie 70) et 156,625 MHz (voie 72).

(*p*) Ces voies (68, 69, 11, 71, 12, 13, 14, 74, 79 et 80) sont les voies à utiliser de préférence pour le service du mouvement des navires, mais si le besoin s'en fait sentir dans une zone déterminée elles peuvent être attribuées au service des opérations portuaires, pour autant qu'elles ne sont pas requises pour le service du mouvement des navires.

(*q*) Cette voie (86) pourra être utilisée comme voie d'appel, si une telle voie est requise dans un système radiotéléphonique automatique qu'aura recommandé le CCIR.

NOC **AP19** APPENDICE 19

Caractéristiques techniques des émetteurs et des récepteurs utilisés dans le service mobile maritime dans le bande 156-174 MHz

(Voir les articles 59 et 60, l'appendice **18** et la Résolution **308**)

1. Seule la modulation de fréquence avec préaccentuation de 6 dB par octave (modulation de phase) est utilisée.

2. L'excursion de fréquence qui correspond à une modulation de 100 % doit être aussi voisine que possible de + 5 kHz. Elle ne doit, en aucun cas, dépasser + 5 kHz.

3. La tolérance de fréquence d'une station côtière ou d'une station de navire est de 10 milionièmes [voir le renvoi *(27)* de l'appendice **7**].

4. Sur chacune des fréquences indiquées dans le tableau de l'appendice **18**, le rayonnement de chaque station doit être polarisé verticalement à la source.

5. La bande des fréquences acoustiques ne doit pas s'étendre au-delà de 3000 Hz.

6. La puissance moyenne des émetteurs des stations de navire doit pouvoir être réduite aisément à une valeur inférieure ou égale à 1 watt.

NOC **AP19A** APPENDICE 20

Caractéristiques des appareils utilisés pour les communications de bord dans les bandes de fréquences comprises entre 450 MHz et 470 MHz

(Voir les numéros **669** et **670**)

1. Il convient que les appareils disposent de voies en nombre suffisant pour leur permettre un service satisfaisant dans la zone de service prévue.

2. La puissance apparente rayonnée doit être limitée au minimum nécessaire pour obtenir un service satisfaisant; en aucun cas elle ne doit dépasser 2 W. Lorsque cela est possible en pratique, il convient que les appareils soient équipés d'un dispositif approprié permettant de réduire aisément la puissance de sortie d'au moins 10 dB.

3. Lorsque des appareils sont installés en des points fixes sur le navire, la hauteur de l'antenne ne doit pas dépasser le niveau de la passarelle de plus de 3,50 métres.

4. Seule la modulation de fréquence avec préaccentuation de 6 dB par octave (modulation de phase) est utilisée.

5. L'excursion de fréquence ne doit pas dépasser + 5 kHz.

6. La tolérance de fréquence est de 5 millionièmes.

7. La bande des fréquences acoustiques ne doit pas s'étendre au-delá de 3000 Hz.

8. Les signaux de télécommande, de télémesure, et les signaux autres que téléphoniques doivent être codés de manière à eviter le plus possible la possibilité de fonctionnement intempestif sous l'effet de signaux brouilleurs.

9. Si l'emploi d'une station-relais requis à bord d'un navire, les paires de fréquences à utiliser sont les suivantes (voir également le numéro **670**):

457,525 MHZ et 467,525 MHz;
457,550 MHZ et 467,550 MHz;
457,575 MHZ et 467,575 MHz.

MOD **AP6** APPENDICE 21

Rapports sur les observations de contrôle international des émissions

(Voir l'article 20)

SECTION I

Rapports relatifs aux stations des services de radiocommunication de Terre

1. Il convient que les rapports concernant les résultats des mesures de fréquence contiennent, dans la mesure nécessaire, les renseignements suivants:

a) Identification de la station de contrôle (administration ou organisation, et emplacement):
b) Date de la mesure:
c) Heure de la mesure (UTC):
d) Indicatif d'appel ou tout autre moyen d'identification de la station contrôlée, ou l'un et l'autre:
e) Classe de l'émission (1);

(1) La classe de l'émission comprend les caractéristiques fondamentales contenues dans l'article 4 et, si possible, les caractéristiques supplémentaires contenues dans l'appendice 6. Les symboles des caractéristiques qui ne peuvent être déterminées sont remplacés par les tirets. Toutefois, en cas d'incertitude pour la classification d'une station entre modulation de fréquence ou modulation de phase, le symbole de modulation de fréquence (F) est utilisé.

f) Fréquence assignée ou fréquence de référence.
g) Tolérance de fréquence;
h) Fréquence mesurée;
i) Précision de la mesure;
j) Écart par rapport à la fréquence assignée ou par rapport à la fréquence de référence;
k) Renseignements supplémentaires (par exemple, période pendant laquelle les mesures ont été effectuées, dérive de la fréquence mesurée pendant cette période, qualité des signaux reçus et conditions de réception);
l) Observations.

2. Il convient que les rapports concernant les résultats des mesures des valeurs du champ ou de la puissance surfacique contiennent, dans toute la mesure nécessaire, les renseignements suivants:

a) Identification de la station de contrôle (administration ou organisation et emplacement);
b) Date de la mesure:
c) Heure de la mesure (UTC):
d) Indicatif d'appel ou tout autre moyen d'identification de la station contrôlée, ou l'un et l'autre:
e) Classe de l'émission (1);
f) Fréquence assignée;
g) Valeur mesurée du champ ou de la puissance surfacique;
h) Précision de la mesure (estimation);
i) Valeur de la composante de polarisation mesurée;
j) Autres éléments ou caractéristiques de la mesure;
l) Observations.

3. Il convient que les relevés d'observations concernant le degré d'occupation du spectre soient fournis, dans la mesure pratiquement possible, dans la forme recommandée par l'IFRB et contiennent, si possible, les renseignements suivants:

a) Identification de la station de contrôle (administration ou organisation, et emplacement);
b) Date de la mesure;
c) Heure de la mesure (UTC);
d) Indicatif d'appel ou tout autre moyen d'identification de la station contrôlée, ou l'un et l'autre;
e) Classe de l'emission (1);
f) Classe de la station et nature du service;
g) Fréquence mesurée;
h) Période pendant laquelle l'émission a été entendue ou enregistrée;
i) Valeur mesurée du champ ou de la puissance surfacique, ou de la force du signal d'aprés l'echelle QSA;
j) Largeur de bande occupée (indiquer si elle a été mesurée ou estimée ou indiquer la largeur de bande nécessaire notifiée à l'IFRB);
k) Renseignements sur la localité ou sur la zone de réception visée;
l) Observations.

4. Il convient d'utiliser, autant que possible, dans la transmission de ces renseignements, les symboles figurant dans le Règlement des radiocommunications ou dans la Préface à la Liste internationale des fréquences.

SECTION II

Rapports relatifs aux stations des services de radiocommunication spatiale

1. Il convient que les rapports concernant les résultats des mesures de fréquence contiennent, dans toute la mesure nécessaire, les renseignements suivants:

a) Identification de la station de contrôle (administration ou organisation, et emplacement);
b) Date de la mesure;

(1) La classe de l'énission comprend les caractéristiques fondamentales contenues dans l'article 4 et, si possible, les caractéristiques supplémentaires contenues dans l'appendice 6. Les symboles des caractéristiques qui ne peuvent être déterminées sont remplacés par les tirets. Toutefois, en cas d'incertitude pour la classification d'une station entre modulation de fréquence ou modulation de phase, le symbole de modulation de fréquence (F) est utilisé.

c) Heure de la mesure (UTC);
d) Indicatif d'appel ou tout autre moyen d'identification de la station contrôlée, ou l'un et l'autre;
e) Classe de l'emission (1);
f) Fréquence assignée ou fréquence de référence;
g) Tolérance de fréquence;
h) Fréquence mesurée;
i) Précision de la mesure;
j) Écart par rapport à la fréquence assignée ou par rapport à la fréquence de référence;
k) Renseignements supplémentaires (par exemple, période pendant laquelle les mesures ont été effectuées, dérive de la fréquence mesurée pendant cette période, qualité des signaux reçus et conditions de réception);
l) Observations.

2. Il convient que les rapports concernant les résultats des mesures de champ ou de puissance surfacique contiennent, dans toute la mesure nécessaire, les renseignements suivants:

a) Identification de la station de contrôle (administration ou organisation, et emplacement);
b) Date de la mesure;
c) Heure de la mesure (UTC);
d) Indicatif d'appel ou tout moyen d'identification de la station contrôlée, ou l'un et l'autre;
e) Classe de l'émission (1);
f) Fréquence assignée;
g) Valeur mesurée du champ ou de la puissance surfacique;
h) Précision de la mesure (estimation);
i) Valeur de la composante de polarisation mesurée;
j) Autres éléments ou caractéristiques de la mesure;
k) Observations.

3. Il convient que les relevés d'observations concernant le degré d'occupation du spectre soient fournis, dans la mesure pratiquement possible, dans la forme recommandée par l'IFRB et contiennent, si possible, les renseignements suivants:

3.1. Rapports relatifs aux observations d'émissions de stations spatiales:

a) Identification de la station de contrôle (administration ou organisation, et emplacement);
b) Date de la mesure;
c) Heure de la mesure (UTC);
d) Indicatif d'appel ou tout autre moyen d'identification de la station contrôlée, ou l'un et l'autre;
e) Classe de l'émission (1);
f) Classe de la station et nature du service;
g) Fréquence mesurée;
h) Période pendant laquelle l'émission a été observée ou enregistrée;
i) Valeur mesurée du champ ou de la puissance surfacique ou de la force du signal d'après l'échelle QSA;
j) Largeur de bande occupée (indiquer si elle a été mesurée ou estimée ou indiquer la largeur de bande nécessaire notifiée à l'IFRB);
k) Polarisation observée;
l) Renseignements concernant l'orbite;
m) Renseignements concernant la localité ou la zone de réception visée, s'ils sont connus;
n) Observations.

3.2. Rapports relatifs aux observations d'émissions de stations terriennes:

a) Identification de la station de contrôle (administration ou organisation, et emplacement);
b) Date de la mesure;
c) Heure de la mesure (UTC);
d) Indicatif d'appel ou tout autre moyen d'identification de la station contrôlée, ou l'un et l'autre;

---

(1) La classe de l'émission comprend les caractéristiques fondamentales contenues dans l'article 4 et, si possible, les caractéristiques supplémentaires contenues dans l'appendice 6. Les symboles des caractéristiques qui ne peuvent être déterminées sont remplacés par les tirets. Toutefois, en cas d'incertitude pour la classification d'une station entre modulation de fréquence ou modulation de phase, le symbole de modulation de fréquence (F) est utilisé.

e) Classe de l'émission (1);
f) Classe de la station et nature du service;
g) Fréquence mesurée;
h) Période pendant laquelle l'émission a été observée ou enregistrée;
i) Valeur mesurée du champ ou de la puissance surfacique, ou de la force du signal d'après l'échelle QSA;
j) Largeur de bande occupée (indiquer si elle a été mesurée ou estimée ou indiquer la largeur de bande nécessaire notifiée à l'IFRB);
k) Renseignements relatifs à la position orbitale où la réception est prévue;
l) Observations.

4. Il convient d'utiliser, autant que possible, dans la transmission de ces renseignements, les symboles figurant dans le Règlement des radiocommunications ou dans la Préface à la Liste internationale des fréquences.

MOD AP7

APPENDICE 22

Rapport sur une irrégularité ou une infraction à la Convention ou au Règlement des radiocommunications

(Voir les articles 21 et 22)

Renseignements relatifs à la station transgressant le Règlement:

1. Nom (*a*), s'il est connu (en caractères majuscules d'imprimerie)...
2. Indicatif d'appel ou autre forme d'identifications (en caractères majuscules d'imprimerie) ...
3. Nationalité, si ell est connue ...
4. Fréquence employée (kHz, MHz, GHz ou THz) ...
5. Classe de l'émission (*b*) ...
6. Classe de station et nature du service, si elles sont connues ...
7. Emplacement (*c*) (*d*) (*e*) ...

Renseignements relatifs à la station ou au bureau centraliseur ou au service d'inspection signalant l'irrégularité ou l'infraction:

8. Nom (caractères majuscules d'imprimerie) ...
9. Indicatif d'appel ou autre forme d'identification (en caractères majuscules d'imprimerie) ...
10. Nationalité ...
11. Emplacement (*c*) (*d*) ...

Renseignements sur l'irrégularité ou l'infraction:

12. Nom (*f*) de la station (en caractères majuscules d'imprimerie) en communication avec celle qui commet l'irrégularité ou l'infraction ...
13. Indicatif d'appel ou autre forme d'identification (en caractères majuscules d'imprimerie) de la station en communication avec celle qui commet l'irrégularité ou l'infraction ...
14. Date et heure (*g*) ...
15. Nature de l'irrégularité ou de l'infraction (*h*) ...
16. Extraits du journl de bord ou autres informations à l'appui du rapport ...

Renseignements relatifs à la station dont l'émission est brouiullée (i):

17. Nom de la station (en caractères majuscules d'imprimerie) ...
18. Indicatif d'appel ou autre forme d'identification (en caractères majuscules d'imprimerie) ...
19. Fréquence assignée (kHz, MHz, GHz ou THz) ...
20. Fréquence mesurée au moment du brouillage ...
21. Classe de l'émission (*b*) et largeur de bande (indiquer si elle a été mesurée ou estimée ou indiquer la largeur de bande nécessaire notifiée à l'IFRB) ...
22. Lieu de réception (*c*) (*d*) (en caractères majuscules d'imprimerie) où le brouillage a été détecté ...
23. Certificat:

Je certifie que le rapport ci-dessus donne, autant que je sache, le compte rendu complet et exact de ce qui a eu lieu.
...
Signature (*j*) ... Date ...

Indications pour remplir ce formulaire

(*a*) Chaque rapport ne fait mention que d'une seule station (voir la note 6). Il doit être envoyé en double exemplaire et, si possible, dactylographié s'il est envoyé par lettre. Il peut être également envoyé sous forme de télégramme.

(*b*) La classe de l'émission comprend les caractéristiques fondamentales contenues dans l'article 4 et, si possible, les caractéristiques supplémentaires contenues dans l'appendice 6. Les symboles des caractéristiques qui ne peuvent être déterminées sont remplacés par des tirets. Toutefois, en cas d'incertitude pour la classification d'une station entre modulation de fréquence ou modulation de phase, le symbole de modulation de fréquence (F) est utilisé.

---

(1) La classe de l'émission comprend les caractéristiques fondamentales contenues dans l'article 4 et, si possible, les caractéristiques supplémentaires contenues dans l'appendice 6. Les symboles des caractéristiques qui ne peuvent être déterminées sont remplacés par les tirets. Toutefois, en cas d'incertitude pour la classification d'une station entre modulation de fréquence ou modulation de phase, le symbole de modulation de fréquence (F) est utilisé.

(*c*) Dans le cas où il s'agit d'une station fixe, terrestre ou terrienne, la position doit être indiquée en latitude et longitude (Greenwich), et en cas d'impossibilité, la zone d'opération doit être indiquée.

(*d*) Dans les cas de stations de navire ou d'aéronef, la position doit être exprimée en latitude et longitude (Greenwich), ou par un relèvement vrai en degrés, et la distance em milles marins ou en kilomètres par rapport à quelque lieu bien connu. En cas d'impossibilité la zone d'opération doit être indiquée.

(*e*) Dans le cas de stations spatiales, donner des renseignements sur l'orbite.

(*f*) Si les deux stations en communication enfreignent le Règlement, un rapport est dressée séparément pour chacune de ces stations.

(*g*) L'heure doit être exprimée en Temps universel coordonné (UTC) par un groupe de quatre chiffres (00.00 à 23.59). Si l'infraction se prolongue ou se répète, les dates et les heures doivent être indiquées.

(*h*) Un rapport séparé est exigé pour chacune des irrégularités ou des infractions, à moins qu'elles se répètent dans une courte période.

(*i*) Ces renseignements n'ont à être fournis que dans le cas d'une plainte en brouillage.

(*j*) Ce rapport doit être signé par l'opérateur qui a relevé l'infraction et contresigné par le commandant du navire ou la personne responsable de l'aéronef ou le chef de la station, lorsqu'il s'agit d'une infraction relevée par une station du service mobile. Lorsque le rapport émane d'un bureau centralisateur ou d'un service d'inspection, il doit être signé par le chef de ce bureau ou de ce service et contresigné par le fonctionnaire de l'administration qui le transmet.

Pour l'usage exclusif de l'administration

1. Compagnie ayant le contrôle de l'installation de la station contre laquelle la plainte est portée ...
2. Nom de l'opérateur de la station tenu pour responsable de l'irrégularité ou de l'infraction aux Règlements ...
3. Mesure prise ...

MOD **AP8**

APPENDICE 23

Rapport sur un brouillage préjudiciable

(Voir l'article 22)

Caractéristiques de la station brouilleuse:

a) Nom ou indicatif d'appel ou autres moyens d'identification ...
b) Fréquence mesurée ... Date ...
Heure (UTC) ...
c) Classe de l'émission (*a*) ...
d) Largeur de bande (indiquer si elle a été mesurée ou estimée) ...
e) Valeur du champ ou de la puissance surfacique mesurés (*b*) ...
Date ...
Heure(UTC) ...
f) Polarisation observée ...
g) Classe de la station et nature du service ...
h) Emplacement/position/zone/relèvement (QTE) ...
i) Emplacement du centre qui a effectué les mesures ci-dessus ...

Caractéristiques de la station dont l'émission est brouillée:

j) Nom ou indicatif d'appel ou autres moyens d'identification ...
k) Fréquence assignée ...
l) Fréquence mesurée ... Date ...
Heure (UTC) ...
m) Classe de l'émission (*a*) ...
n) Largeur de bande (indiquer si elle a été ou estimée ou indiquer la largeur de bande nécessaire notifiée à l'IFRB) ...
o) Emplacement/position/zone ...
p) Emplacement du centre qui a effectué les mesures ci-dessus ...

Renseignements fournis par la station de réception qui a constaté le brouillage:

q) Nom de la station ...
r) Emplacement/position/zone ...
s) Dates et heures (UTC) du brouillage préjudiciable ...
t) Relèvement (QTE) ou autres détails ...
u) Nature du brouillage ...
v) Champ ou puissance surfacique de l'émission désirée à la station de réception subissant le brouillage (*b*) ...
Date ...
Heure (UTC) ...
w) Polarisation de l'antenne de réception ou polarisation observée ...
x) Mesures à prendre ...

Note. — Par souci de commodité et de brièveté, les rapports télégraphiques seront conformes au modèle ci-dessus; on utilisera, dans l'ordre où elles sont énumérées ci-dessus, les lettres désignant chacune des rubriques au lieu de ces rubriques elles-mêmes, mais seulement celles pour lesquelles existent des informations disponibles. Néanmoins, ce rapport doit contenir les informations suffisantes pour permettre à l'administration qui le reçoit d'entreprendre l'enquête appropriée.

(*a*) La classe de l'emission comprend les caractéristiques fondamentales contenues dans l'article 4 et, si possible, les caractéristiques supplémentaires contenues dans l'appendice 6. Les symboles des caractéristiques qui ne peuvent être déterminées sont remplacés par des tirets. Toutefois, en cas d'incertitude pour la classification d'une station entre modulation de fréquence ou modulation de phase, le symbole de modulation de fréquence (F) est utilisé.

(*b*) Lorsque ces mesures ne sont pas possibles, la force du signal selon l'échelle QSA devrait être indiquée.

NOC AP16

APPENDICE 24

Table d'épellation des lettres et des chiffres

(Voir les articles 27 et 65)

1. Lorsqu'il est nécessaire d'épeler des indicatifs d'appel, des abréviations réglementaires ou des mots, on utilise la table d'épellation des lettres ci-dessous:

Lettre à transmettre	Mot de code	Prononciation du mot de code (a)
A	Alfa	AL FAH
B	Bravo	BRA VO
C	Charlie	TCHAH LI ou CHAR LI
D	Delta	DEL TAH
E	Echo	ÈK O
F	Foxtrot	FOX TROTT
G	Golf	GOLF
H	Hotel	HO TÈLL
I	India	IN DI AH
J	Juliett	DJOU LI ÈTT
K	Kilo	KI LO
L	Lima	LI MAH
M	Mike	MA ÏK
N	November	NO VÈMM BER
O	Oscar	OSS KAR
P	Papa	PAH PAH
Q	Quebec	KÉ BEK
R	Romeo	RO MI O
S	Sierra	SI ER RAH
T	Tango	TANG GO
U	Uniform	YOU NI FORM ou *OU* NI FORM
V	Victor	VIK TAR
W	Whiskey	OUISS KI
X	X-ray	EKSS RÉ
Y	Yankee	YANG KI
Z	Zoulou	ZOU LOU

(a) Les syllabes accentuées sont soulignées.

2. Lorsqu'il est nécessaire d'épeler des signes des chiffres ou de signes on utilise la table ci-dessous:

Chiffre ou signe à transmettre	Mot de code	Prononciation du mot de code (a)
0	NADAZERO	NAH-DAH-ZE-ROH
1	UNAONE	OU-NAH-OUANN
2	BISSOTWO	BIS-SO-TOU
3	TERRATHREE	TÉ-RAH-TRI
4	KARTEFOUR	KAR-TE-FO-EUR
5	PANTAFIVE	PAN-TAH-FA-ÏF
6	SOXISIX	SOK-SI-SIKS
7	SETTESEVEN	SE-TE-SEV'N
8	OKTOEIGHT	OK-TOH-EÏT
9	NOVENINE	NO-VE-NAÏ-NEV
Virgule décimale	DECIMAL	DE-SI-MAL
Point	STOP	STOP

(a) Toutes les syllabes sont pareillement accentuées.

3. Cependant les stations d'un même pays peuvent utiliser, lorsqu'elles communiquent entre elles, une autre table établie par l'administration dont elles dépendent.

APPENDICE 25 MAR2

Plan d'allotissement de fréquence aux stations côtières radiotéléphoniques fonctionnant dans les bandes exclusives du service mobile maritime entre 4000 et 23 000 kHz

(Voir les numéros 4198 et 4212 du Règlement des radiocommunications et l'appendice 16)

Observation. — Note du Secrétaire général: cet appendice n'est pas reproduit dans les présents Actes finals.

NOC **AP26** APPENDICE 26 Aer

Plan d'allotissement de fréquences pour le service mobile aéronautique et renseignements connexes

Cet appendice au Règlement des radiocommunications (Genève, 1959) a été publié dans un fascicule à part. Concernant le service mobile aéronautique (R) un Plan révisé a été adopté en 1966 par la Conférence aéronautique; il est contenu dans l'appendice **27**. *Mais le Plan adopté en 1959 pour le service mobile aéronautique (OR) demeure en vigueur, de sorte que c'est à l'appendice* **26** *qu'il y a lieu de se référer en ce qui concerne ce service. Des exemplaires de l'appendice* **26** *(édition de 1959) sont disponibles au Secrétariat général de l'UIT.*

NOC **AP27** APPENDICE 27 Aer (1)

MOD **Plan d'allotissement de fréquences pour le service mobile aéronautique (R) et renseignements connexes entre 2850 kHz et 17 970 kHz**

Cet appendice est publié dans un fascicule à part. Il contient exclusivement des dispositions concernant le service mobile aéronautique (R), qui remplacent les dispositions concernant ce service qui sont contenues dans l'appendice **26.** *C'est donc exclusivement aux dispositions de l'appendice* **27** *qu'il y a lieu de se référer en ce qui concerne le service mobile aéronautique (R).*

MOD **AP27 Aer2** APPENDICE 27 Aer2 (1)

Plan d'allotissement de fréquences pour le service mobile aéronautique (R) et renseignements connexes entre 2850 kHz et 22 000 kHz

Observation. — Voir l'annexe à la Résolution **404.**

MOD **AP28** APPENDICE 28

Méthode de détermination de la zone de coordination d'une station terrienne dans les bandes de fréquences comprises entre 1 GHz et 40 GHz partagées entre services de radicommunication spatiale et de radiocommunication de Terre

1. *Objectifs.*

On détermine la zone de coordination (voir le numéro **165**) en calculant tous les azimuts à partir de la station terrienne, les distances de coordination (voir le numéro **167**) et en traçant à l'échelle sur une carte appropriée le contour de coordination (voir le numéro **166**).

In faut souligner que l'existence ou l'installation d'une station de Terre à l'intérieur de la zone de coordination d'une station terrienne n'empêche pas forcément le bon fonctionnement de la station terrienne ou de cette station de Terre, car méthode est fondée su les hypothèses le plus défavorables pour ce qui concerne les brouillages.

Pour déterminer la zone de coordination, ou peut envisager deux cas:

1) Celui de la station terrienne à l'émission (susceptible de brouiller des stations de Terre);
2) Celui de la station terrienne à la réception (susceptible d'être brouillée par des stations de Terre).

Quand une station terrienne est destinée à émettre diverses classes d'émission, les paramètres de station terrienne à utiliser pour la détermination du contour de coordination doivent être ceux qui conduisent aux distances de coordination le plus grandes, pour chaque faisceau d'antenne de station terrienne et dans chaque bande de fréquences attribuée que la station terrienne se propose d'utiliser en partage avec les services de Terre.

Quand une station terrienne est destinée à recevoir diverses classes d'émission, les paramètres de station terrienne à utiliser pour la détermination du contour de coordination doivent être ceux qui conduisent aux distances de coordination les plus grandes, pour chaque faisceau d'antenne de station terrienne et dans chaque bande de fréquences attribuée que la station terrienne se propose d'utiliser en partage avec les services de Terre sauf dans le cas où l'administration responsable de la station terrienne constate qu'un contour de coordination plus petit premettrait d'assurer la protection adéquate de toutes les émissions destinées à être reçues par la station terrienne. Lorsque la détermination d'un tel contour de coordination diffère de la procédure décrite dans le présent appendice, l'administration notificatrice doit indiquer avec précision la nature de cette différence.

Si une administration décide ultérieurement de protéger sa station terrienne de réception en notifiant un contour de coordination plus grand que celui qu'elle avait déterminé selon une méthode différente de celle que décrit le présent appendice, elle doit coordonner à nouveau la station terrienne. Toute protection plus grande résultant de cette nouvelle coordination doit prendre effet à partie de la date de publication de la fiche de notification dans la partie II de la circulaire hebdomadaire de l'IFRB.

---

(1) Jusqu'au 31 janvier 1983 à 23.59 UTC puis remplacé par l'appendice **27 Aer2.**

Le présent appendice présente des méthodes permetttant le détermination graphique ou informatique de la zone de coordination.

Il est suggéré de tracer, en plus du contour de coordination, des contours auxiliares fondés sur des hypothèses moins défavorables que celles utilisées pour la détermination du contour de coordination. Ces contours auxiliaires peuvent être utilisés au cours de négociations ultérieures entre les administrations intéressées en vue d'èliminer de ces négociations (sans qu'il soit nécessaire d'avoir recours à des calculs plus précis) le cas de certaines stations existantes ou en project situées à l'intérieur de la zone de coordination. La méthode à appliquer pour obtenir et utiliser ces contours auxiliaires est expliquée dans l'annexe I au présent appendice.

2. *Considérations générales.*

2.1. *Notion d'affaiblissement de transmission minimal admissible.*

La détermination de la distance de coordination — distance à partie d'une station terrienne au-delà de laquelle on peut considérer comme négligeable le brouillage causé ou subi par une station de Terre — repose sur le postulat que l'affaiblissement du signal brouilleur augmente e régulièrement en fonction de la distance.

La valeur de l'affaiblissement requis entre un émetteur brouillIer et un récepteur brouillé est donnée par l'affaiblissement de transmission minimal admissible (dB) pendant p % du temps (valeur que l'affaiblissement de transmision prévu doit dépasser pendant $(100 - p)$ % du temps):

$$L(p) = P_{t'} - P_r(p) \qquad (1)$$

dans cette formule:

$P_{t'}$ (1) — niveau de puissance d'émission maximale disponible (en dBW) dans la largeur de bande de référence, à l'entrée de l'antenne d'une station brouillleuse;

$P_r(p)$ — niveau admissible d'une émission brouilleuse (en dBW) dans la largeur de bande de référence, qui ne doit pas être dépassé pendant plus de p % du temps à la sortie de l'antenne de réception d'une station brouillé, lorsque l'émission brouillleuse a pour origine une source unique.

$P_{t'}$ et $P_r(p)$ sont définis pour la même largeur de bande radioéléctrique (largeur de bande de référence) et $L(p)$ et $P_r(p)$ sont définis pour le même pourcentage de temps, imposé par les critères de qualité du système brouillé.

Pour les faibles pourcentages de temps dont il est question ici, il est nécessaire de distinguer entre deux mécanismes d'affaiblissement nettement différents:

L'affaiblissement de signaux sujets à une propagation troposphérique suivant des trajects voisins du grand cercle: mode (1), voir le § 3;

L'affaiblissement de signaux sujets à la diffusion par des hydrométéores; mode (2), voir le § 4.

2.2. *Notion d'affablissement de transmission de réference minimal admissible.*

Dans le cas du mode de propagation (1), l'affaiblissement de transmission est défini sous forme de paramètres séparables, à savoir un affaiblissement de transmission de référence (c'est-à-dire entre antennes isotropes) et les gains effectifs des antennes à chaque extrémité du traject de brouillage. L'affaiblissement de transmission de référence minimal admissible peut s'exprimer par:

$$L_b(p) = P_{t'} + G_{t'} + G_r - P_r(p) \qquad (2)$$

où:

$L_b(p)$ — affaiblissementd de transmission de référence minimal admissible (dB) pendant p % du temps [valeur que l'affaiblissement de transmission de référence prévu doit dépasser pendant $(100 - p)$ % du temps];

$G_{t'}$ — gain isotrope (dB) de l'antenne d'émission de la station brouilleuse. Si la station brouilleuse est une station terrienne, il s'agit ici du gain de l'antenne vers l'horizon physique dans l'azimut considéré; dans le cas d'une station de Terre, on utilisera le gain maximal de l'antenne de cette station;

G_r — gain isotrope (dB) de l'antenne de réception de la station brouillée. Si la station brouillée est une station terrienne, il s'agit ici du gain vers l'horizon physique dans l'azimut considéré; dans le cas d'une station de Terre, on utilisera le gain maximal de l'antenne de cette station.

L'annexe II décrit des méthodes numérique et graphique permettant de déterminer l'angle formé par les faisceau principal de l'antenne de la station terrienne et l'horizon physique ainsi que le gain de l'antenne en direction de l'horizon, en fonction de l'angle azimutal.

Lorsq'il s'agit du cas de satellites non géostationnaires celui des deux gains $G_{t'}$ et G_r qui se rapporte à une antenne de station terrienne varie avec le temps. Dans ce cas, on doit employer un gain équivalent (2) d'antenne de station terrienne,

---

(1) Les symboles munis d'un signe prime se rapportent aux caractéristiques de la station brouilleuse.

(2) Ce gain équivalent ne doit pas être employé quand l'antenne de station terrienne reste pointée dans la même direction pendant des durées appréciables (par exemple, quand elle travaille avec des sondes spatiales ou des satellites presque géostationnaires).

invariable dans le temps, et qui soit égal à la plus grande des deux quantités; le gain maximal de l'antenne en direction de l'horizon, diminué de 10 dB, le gain de cette antenne en direction de l'horizon, diminué de 10 dB, le gain de cete antenne en direction de l'horizon qui n'est pas dépassé pendant plus de 10 % du temps (si on le connaît).

2.3. *Détermination et tabulation des paramètres de brouillage.*

2.3.1. *Niveau admissible de l'émission brouilleuse.*

Le niveau admissible de l'émission brouilleuse (dBW) dans la largeur de bande de référence, qui ne doit pas être dépassé pendant plus de p % du temps à la sortie de l'antenne de réception d'une station susceptible d'être brouillé, sous l'effect de chaque source de brouillage, est donnée par la relation générale:

$$P_r(p) = 10\ log\ (kT_e\ B) + J + M\ (p) — W \tag{3}$$

où:

$$M\ (p) = M\ (p_0 / n) = M_0\ (p_0) \tag{4}$$

avec:

k — constante de Boltzmann $1{,}38 \times 10^{-23}$ J / K;
T_e — température de bruit thermique du système de réception (K), à la sortie de l'antenne de réception (voir *note 1*);
B — largeur de bande de référence (Hz) (largeur de bande intéressant le système brouillé, dans laquelle on peut déterminer la valeur moyenne de la puissance de l'émission brouilleuse);
J — valeur à long terme (20 % du temps) du rapport (dB) de la puissance admissible de l'émission brouilleuse à la puissance de bruit thermique du système de réception, rappportées aux bornes de sortie de l'antenne de réception (voir *note 2*);
P_0 — pourcentage du temps pendant lequel le brouillage provenant de toutes les sources peut dépasser la valeur admissible;
n — nombre des cas de brouillage supposés non corrélés, auquel on s'attend;
p — pourcentage du temps pendant lequel le brouillage provenant d'une source peut dépasser la valeur admissible; du fair de la non-simultanéité probable des cas de brouillage $p = p_0 / n$;
$M_0\ (p_0)$ — rapport (dB) entre les puissances admissibles de l'émission brouilleuse pour tous les cas de brouillage, d'une part pendant p_0 %, d'autre part pendant 20 % du temps (voir *note 3*);
$M\ (p)$ — rapport (dB) entre les puissances admissibles de l'émission brouilleuse, d'une part pendant p % du temps et pour un cas de brouillage, d'autre pendant 20 % du temps et pour tous les cas de brouillage;
W — facteur d'équivalence (dB) permettant d'établir une relation entre le brouillage provenant d'émission brouilleuses et celui provoqué par l'introdution d'un bruit thermique supplémentaire de même puissance dans la largeur de bande de référence. Ce facteur est positif dans les cas où les émissions brouilleuses causent davantage de dégradation que le bruit thermique (voir *note 4*).

Les tableaux I et II donnent les valeurs des paramètres ci-dessus.

Dans certains cas, une administration peut avoir des raisons de penser que, pour sa station terrienne, il peut être justifié d'adopter des valeurs qui diffèrent de celles qui sont indiquées dans le tableau II. Il convient d'attirer l'atention sur le fait que, pour certains systèmes déterminées, il peut être nécessaire de modifier les largeurs de bandes B ou, par exemple dans le cas des systèmes à assignation en fonction de la demande les pourcentages de temps p et p_0 par rapport aux valeurs indiquées dans le tableau ii. Le § 2.3.2 fournit d'autres renseignements à ce sujet.

Note 1. — La température de bruit du système de réception, en kelvins rapportée aux bornes de sortie de l'antenne de réception, peut être déterminer d'aprés la formule:

$$T_e — T_a + (e — 1)\ 290 + eT_r \tag{5a}$$

où:

T_a — température de bruit (K) produite par l'antenne de réception;
e — valeur numérique de l'affaiblissement sur la ligne de transmisison (par exemple un guide d'ondes) entre l'antenne et les bornes d'entrée du récepteur;
T_r — température de bruit (K), y compris la contribution des étages successifs, rapportée aux bornes d'entrée du récepteur.

Pour les récepteurs de faisceaux hertziens et lorsque l'affaiblisement dans le guide d'ondes d'une station terrienne de réception n'est pas connu, on utilisera une valeur de e égale à 1,0.

Note 2. — Le facteur J (dB) est défini comme le rapport de la puissance totale admissible à long terme d'émissions brouilleuses (pendant 20 % du temps) dans le système, à la puissance de bruit radioélectrique thermique à long terme dans un seul récepteur. Lorsqu'on calcule le facteur J, on considère que l'émissions brouilleuse a une densité spectrale de puissance uniforme et on tient compte de la forme réelle de son spectre au moyen du facteur W (voir ci-dessous). Par exemple, dans un circuit fictif de référence pour faisceaux hertizens à 50 bonds, la puissance totale admissible de brouillage cumulé est de 1000 pW0p (Avis 357-3 du CCIR) et la puissance moyenne de bruit thermique par bond peut être supposée de 25 pW0p. En conséquence, puisque, dan un système à multiplexage par répartition en fréquence et modulation de fréquence (MRF/MF), le rapport entre une puissance de bruit de brouillage uniforme et le bruit thermique dans la même bande de référence est le même avant et aprés démodulation, J est donnée par la rapport 1000/25, sout 16 dB si on l'exprime en décibels. Dans un système du service fixe par satellite, la puissance totale de brouillage admissible est aussi de 1000 pW0p (Avis 356-4 du CCIR), alors que la contribution de bruit thermique de la liaison descendante ne doit pas dépasser 7000 pW0p, ce qui entraine $J \geq -8{,}5$ dB.

Dans les systèmes numériques, on spécifie et en mesure le brouillage par le taux d'erreur sur les bits ou par l'argumentation admissible de ce taux d'erreur. Si l'argumentation du taux d'erreur sur les bits est cumulative dans un circuit de référence comprenant des liaisons en tandem, la puissance radioélectrique des émissions brouilleuses qui est la cause de cette augmentation du taux d'erreur sur les bits n'est pas cumulative, car le taux d'erreur sur les bits n'est pas une fonction linéaire du niveau de puissance radioélectrique des émissions brouilleuses. Il peut donc être nécessaire de protéger séparément chaque récepteur. Dans les faisceaux hertziens numériques fonctionnnant au-dessus de 10 GHz et pour tous les systèmes numériques à satellites, la puissance de brouillage à long terme peut être du même ordre de grandeur que le bruit thermique à long terme, d'où $J = 0$ dB. Dans les faisceaux hertziens numériques fonctionnant au-dessous de 10 GHz, il convient que la puissance de brouillage à long terme ne réduise pas de plus d'environ 1 dB la marge d'évanouissement du récepteur. Ainsi il convient que la puissance de brouillage à long terme soit inférieure d'environ 6 dB à la puissance de bruit thermique, d'où $J = -6$ dB.

Note 3. — M_0 (p_0) est la «marge de brouillage» (dB) entre les puissances admissibles à court terme (p_0 %) et à long terme (20 %) d'une émission brouilleuse.

Dans le cas des système analogiques de faisceaux hertziens et de ceux du service fixe par satellite entre 1 GHz et 15 GHz, cette marge est égale au rapport (dB) entre 50 000 et 1000 pW0p, soit 17 dB.

Dans les cas des systèmes numériques et dans la plupart des régions du monde, on peut, dans beaucoup de cas, définir utilement les caractéristiques d'un système fonctionnant aux fréquences supérieures à 10 GHz par le pourcentage de temps p_0 pendant lequel le niveau du signal utile peut descendre en dessous du seil de fonctinnement, spécifié par un taux d'erreur sur les bits donnée. Pendant le fonctionnement sans évanouissement du système, le niveau du signal utile dépasse le seuil d'une marge M_s qui dépend de la zone hydrométéorologique dans laquelle la station fonctionne. Plus cette marge est grande, plus est grande l'élevation du niveau de l'émission brouilleuse qui dégraderait le système jusqu'au niveau du seuil. Comme première approximation, on suppose que, pour de faibles pourcentages du temps (de l'ordre de 0,001 % à 0,003 %), le niveau tólerable des émissions brouilleuses est égal, en puissance, au bruit thermique qui existe à l'entrée du démodulateur en presénce d'évanouissement. On peut donc supposer, que, pour les systèmes numériques fonctionnant au-dessus de 10 GHz, M_0 (tableaux I et II) est égal à la marge d'evanouissement M_s du système. Dans les faisceaux hertziens numériques fonctionnant au-dessous de 10 GHz, on suppose que l'on peut admettre que la puissance à court terme d'une émission brouilleuse dépasse la puissance à long terme de cette émission d'une quantité égale à la marge d'évanouissement du système moins J, c'est-à-dire 41 dB, si $J = -6$ dB.

Note 4. — Le facteur W (dB) est le rapport de la puissance de bruit thermique radioélectrique à la puissance de l'émission brouilleuse dans la largeur de bande de référence, lorsqu'elles produisent toutes deux le même brouillage après démodulation (dans un système MRF/MF, on exprimerait que les puissances de bruit sont identiques dans une voie téléphonique et, dans un système numérique que les probabilités d'erreur sur les bits sont identiques). Pour les signaux à modulation de fréquence, ce facteur est défini comme suit:

$$W = 10 \log \left\{ \frac{\text{Puissance de bruit thermique à la sortie de l'antenne de réception dans la largeur de bande de référence}}{\text{Puissance de L'émission brouilleuse à la sortie de l'antenne de réception aux fréquences radioélectriques dans la largeur de bande de référence}} \times \frac{\text{Puissance de brouillage dans le système de réception après démodulation}}{\text{Puissance de bruit thermique dans le système de réception après démodulation}} \right\} \quad (5b)$$

Le facteur W dépend des caractéristiques du signal utile et du signal brouilleur. Cependant, pour éviter d'avoir à considérer une large gamme de caractéristiques, on a déterminé pour ce facteur une valeur maximale. Quand le signal utile est modulé en fréquence, et pour des taux de modulation efficaces supérieures à l'unité, W ne dépasse pas 4 dB. En pareil cas, on fixera, par prudence, à 4 dB la valeur du facteur W dans la relation (3) indépendamment des caractéristiques du signal brouilleur. Pour des systèmes MRF/MF à faible indice, une largeur de bande de référence très étroite (4 kHz) implique pour W des valeurs ne dépassant pas 0 dB. En pareil cas, on fixera, par prudence, à 0 dB la valeur du facteur W dans la relation (3), indépendamment des caractéristiques du signal brouilleur.

Quand le signal utile est numérique, W est habituellement inférieur ou égal à 0 dB, quelles que soient les caractéristiques du signal brouilleur.

2.3.2. *Paramètres de coordination pour les émissions à bande très étroite (station terrienne de réception).*

2.3.2.1. *Généralités.*

Dans le cas d'une station terrienne qui reçoit à la fois des émissions à large bande et des émissons à bande très étroite (par exemple dans les systèmes à une seule voie par porteuse, SPPC), il peut être souhaitable de tracer deux contours de coordination séparés, l'un pour les émissions à bande étroite et l'autre pour les émissions à large bande, en indiquant spécifiquement les parties de bande restreintes utilisées pour les émissions à bande très étroite.

2.3.2.2. *Emissions à bande étroite avec préassignation.*

Pour ces émissions, il convient de remplacer la valeur de la largeur de bande de référence par celle de la largeur de bande occupée par une émission à bande étroite du type considéré.

2.3.2.3. *Emissions à bande étroite à assignation en fonction de la demande.*

Pour ces émissions, il peut être utile en outre de tenir compte de la probabilité réduite pour qu'une voie donnée subisse des brouillages au moment même où elle est choisie en vue d'être utilisée dans une station terrienne.

Les administrations doivent fournir toutes les données techniques pertinentes utilisées pour la détermination du (des) contour(s) de coordination pour de telles émissions.

3. *Détermination de la distance de coordination pour le mode de propagation (1) — Mécanismes de propagation le long du grand cercle:*

3.1. Zones radioclimatiques.

Pour calculer la distance de coordination dans le cas du mode de propagation (1), on divise la Terre en trois grandes zones radioclimatiques, les Zones A, B et C, qui se définissent comme suit:

Zone A — terres;

Zone B — mers, océans et grandes étendues d'eau (comme critère, une étendue d'eau pouvant couvrir un cercle de 100 km de diamètre), à des latitudes supérieures à 23° 30' N ou S, à l'exception de la mer Noire et de la mer Méditerranée;

Zone C — mers, océans et grandes étendues d'eau (comme critère, une étendue d'eau pouvant couvrir un cercle de 100 km de diamètre), à des latitudes inférieures à 23° 30' N ou S, y compris la mer Noire et de la mer Méditerranée.

3.2. *Calcul de la distance de coordination sur des trajects compris dans une seule zone radioclimatique.*

3.2.1. *Généralités.*

La formule (2) donne la valeur de l'affaiblissement de transmission de référence minimal admissible L_b (p) pendant p % du temps. A partir de cette valeur, on calcule la distance de coordination dans chaque zone radioclimatique en utilisant l'une ou l'autre des deux méthodes suivantes: la première, décrite au § 3.2.2, est une méthode numérique qui fait appel à plusieurs formules mathématiques et qui est surtout conçue pour être utilisée avec un ordinateur; la seconde, décrite au § 3.2.3, est une méthode graphique.

Lorsque la distance déterminée à l'aide des méthodes respectivements décrites aux § 3.2.2 ou 3.2.3 tient entièrement dans les limites de la zone radioclimatique à laquelle appartient la station terrienne cette distance est considérée comme la distance effective de coordination pour le mode de propagation (1). Si cette distance ne tient pas dans les limites d'une seule zone radioclimatique, la distance globale de coordination se calcule en appliquant la méthode décrite ai § 3.3.

3.2.2. *Méthode numérique.*

La relation entre l'affaiblissement de transmission de référence minimal admissible et la distance de coordination s'exprime par la formule:

$$L_h\,(p) - A_0 + Bd_1 + A_h \tag{6}$$

où:

$A_0 = 120 + 20\ log\ f$ (dB);
β — taux d'affaiblissement (dB/km);
d_1 — distance de coordination pour le mode de propagation (1) (km);
A_h — correction due à l'angle de l'horizon (dB);
f — fréquence (GHz);
A_h — se calcule comme suit:

$$A_h\ 20 \log\ (1 + 4{,}5 f^{1/2}\varepsilon) + f^{1/3} \text{ pour } \varepsilon > 0° \ (^1) \tag{7a}$$

$$A_h = 8\varepsilon \text{ pour } -0{,}5° \le \varepsilon \le 0° \tag{7b}$$

$$A_h = -4 \text{ pour } \varepsilon \le -0{,}5° \tag{7c}$$

où ε: angle de l'horizon (2) (degrés).

A partir de la formule (6), la distance de coordination d_1 se calcule comme suit:

$$d_1 = (L_b\,(p) - A_0 - A_h)/\beta \tag{8}$$

La valeur de β dépend de la zone radioclimatique et du pourcentage de temps p; elle est répresentée comme la somme de trois éléments:

$$\beta = \beta_z + \beta_v + \beta_o \tag{9}$$

où:

β_z — taux d'affaiblissement (dB/km) dû à tous les effets, sauf celui des gaz atmophériques;
β_v — taux d'affaiblissement (dB/km) dû à la vapeur d'eau atmophérique;
β_o — taux d'affaiblissement (dB/km) dû à l'oxygène.

β, dépend de la zone radioclimatique, de la fréquence et du pourcentage de temps. Sa valeur est donnée par les formules:

pour la Zone A:

$$\beta_{zA} = 0{,}154\ (1 + 3{,}05\ log\ f)^{0.4}\ (0{,}9028 + 0{,}0486\ log\ p)^2 \tag{10}$$

---

(1) On doit utiliser l'équation (7a) et donc la fig. 1 avec précaution aux fréquences supérieures à environ 20 GHz ou aux angles de l'horizon supérieures à 5° jusqu'à ce que le CCIR ait entrepris des études sur ce sujet conformément à la Rèsolution 60.

(2) On définit ici «l'angle de l'horizon» comme étant l'angle vu du centre de l'antenne de la station terrienne, formé par le plan horizontal et un rayon qui passe sous incidence rasante à l'horizon physique visible dans la direction considérée.

pour las Zones B et C:

$$\beta_{zB} = \beta_{zC} = (0{,}272 + 0{,}047\ log\ p)^2 \tag{11}$$

β_v dépend de la fréquence et de la densité de la vapeur d'eau atmosphérique (β_v est négligeable si $f < 15$ GHz). Sa valeur est donnée par la formule:

$$\beta_v = 3{,}5 \times 10^{-4}\ \rho \left[\frac{1}{\left(1 - \frac{22{,}3}{f}\right)^2 + \frac{9}{f^2}} + \frac{1}{\left(1 - \frac{22{,}3}{f}\right)^2} \right] + 3 \times 10\text{-}6\ \rho f^2 \tag{12}$$

où ρ représente la densité de la vapeur d'eau (g/m³) et dépend de la zone radioclimatique. Il y a lieu d'utiliser les valeurs suivantes:

Zone A, $\rho = 1$ g/m³;
Zone B, $\rho = 2$ g/m³;
Zone C, $\rho = 5$ g/m³.

β_o dépend de la fréquence, sa valeur est donnée par la formule:

$$\beta_o = 68 \times 10^{-4} \times f^2 \left\{ \frac{1}{(60 - f)^2} + \frac{1}{(60 + f)^2} + \frac{1}{(f^2 + 0{,}36} \right\} \tag{13}$$

On calcule donc la distance de coordination dans la Zone A, pour la fréquence, le pourcentage de temps et l'angle de l'horizon appropriés, en appliquant les formules (7), (8), (9), (10), (12) et (13). D'une façon similaire, on calcule la distance de coordination dans la Zone B ou dans la Zone C au moyen des formules (7), (8), (9), (11), (12) et (13).

3.3.2. *Méthode graphique.*

Les formules du § 3.2.2 ont été converties sous forme de courbes, ce qui constitue la seconde méthode d'évaluation de la distance de coordination pour le mode de propagation (1). Il est à noter que la méthode ghaphique peut se substituer à la méthode du § 3.2.2 et qu'il appartient à chaque administration d'utiliser la méthode qui lui paraît la plus commode.

L'affaiblissement de transmission de référence minimal admissible L_b (p) se calcule à l'aide de la formule (2). On déduit l'«affaiblissement de coordination», L_l, en soustrayant de l'affaiblissement de transmission de référence minimal admissible de la correction A_h due à l'angle de l'horizon:

$$L_l = L_b\ (p) - A_h \tag{14}$$

Les valeurs de la correction due à l'angle de l'horizon se déduisent de la figure 1, pour la fréquence et l'angle de l'horizon appropriés (1).

On détermine de la façon suivante la distance de coordination dans chaque zone radioclimatique. Prenons d'abord la Zone A: la distance de coordination pendant 0,01 % du temps, d_A (0,01), est tirée de la figure 2 en se fondant sur les valeurs appropriées de l'affaiblissement de coordination L_l et la fréquence. Pour p % du temps, la distance de coordination en Zone A s'obtient alors en multipliant la distance associée à 0,01 % du temps par le facteur Δp_A que donne la fig. 3.

$$d_A = d_A\ (0{,}01) \times \Delta p_A \tag{15}$$

D'une manière similaire, la distance de coordination dans la Zone B est fondée sur les valeurs de d_B (0,01) et de Δp_{BC} respectivement tirées des figures 4 et 3; la distance de coordination, dan la Zone C est fondée sur les valeurs de d_c (0,01) et de Δp_{BC} respectivement tirées des figures 5 et 3.

3.3. *Trajets mixtes.*

Si la distance à calculer s'étend sur plusieurs zones radioclimatiques (trajet mixte), la prévision se fait-de la manière suivante:

Si l'on désigne par les indices *i, j, k* ... les sections successives du trajet dans des zones différentes, on a:

$$L_h\ (p) - A_0 - A_h = \beta_i\ d_i \tag{16}$$

où β_i est la taux d'affaiblissement dans le première zone (i).

Si d est supérieur à la distance D_i dans a première zone (i) pour la direction considérée, le trajet se prolonge dans la deuxième zone (j) et on peut écrire:

$$L_b\ (p) - A_0 - A_h - \beta_i D_i = \beta_j d_j \tag{17}$$

(1) On définit ici «l'angle de l'horizon» commne étant l'angle vu du centre de l'antenne de la station terrienne, formé par le plan horizontal et un rayon qui passe sous incidence rasante à l'horizon physique visible dans la direction considérée.

d'où l'on tire d_j. Si d_j est supérieur à la longeur D_j du traject dans la deuxième zone (j), on peut écrire:

$$L_h(p) - A_0 - A_h - \beta_i D_i - \beta_j D_j = \beta_k d_k \quad (18)$$

d'ou l'on tire d_k. La méthode peut être répétée aussi souvent qu'on le désire: dans le cas considéré, la distance totale d_1 a pour expression:

$$d_1 = D_j + D_j + d_k \quad \text{(km)} \quad (19)$$

On trouvera dans l'annexe III des exemples d'application graphique ce cette méthode.

3.4. *Distance de coordination maximale pour le mode de propagation (1).*

Si, en déterminant la distance de coordination pour le mode de propagation (1), on obtient des valeurs supérieures à la valeur indiquée à la figure 6 ou dans la tableau III, la distance de coordination pour le mode de propagation (1) sera la valeur indiquée à la figure 6 ou dans la tableau III. Dans le cas de trajects mixtes, les valeurs à considérer sont celles indiquées pour les Zones B ou C, selon le cas. Dans le cas de trajects mixtes avec plusieurs portions dans la Zone A, la distance totale dans la Zone A ne doit pas dépasser la valeur indiquée pour cette Zone à la figure 6 ou dans le tableau III.

4. *Détermination du contour de coordination pour le mode de propagation (2) — Diffusion par les hydrométéores.*

Dans le cas du mécanisme de propagation par diffusion par les hydrométérores (pluie), le contour de coordination est déterminé au moyen d'un traject dont la configuration est sensiblement différente de celle qui intervient dans les mécanismes de la propagation sur l'arc de grand cercle. En première approximation, la pluie entraîne une diffusion isotrope de l'énergie de telle sorte que le brouillage peut se manisfester dans de très grands angles de diffusion et dans des intersections de faisceaux éloignés de l'arc de grand cercle.

4.1. *Affaiblissement de transmission normalisé L_2 (0,01).*

Pour déterminer le contour de coordination correspondant à la diffusion par la pluie, il faut calculer l'«affaiblissement de transmission normalisé» en appliquant la formule suivante:

$$L_2(0{,}01) = P_{r'} + DG - P_r(p) - F(p, f) \quad (20)$$

Dans cette formule:

ΔG — différence (dB) entre la valeur du gain maximal des antennes de stations de Terre fonctionnant dans la bande de fréquences considérée et la valeur de 42 dB. Lorsque la station terrienne est une station d'émission, ΔG est donnée par le tableau I: lorsque la station terrienne est une station de réception, ΔG est donnée par le tableau II;

$F(p, f)$ — correction (dB) à appliquer pour passer du pourcentage de 0,01 % au pourcentage de temps effectif p dans la bande de fréquences considérée (voir le figure 7).

Les autres paramètres sont définis au § 2. Pour les stations de Terre, les valeurs de $P_{r'}$ sont indiquées dans le tableau II.

4.2. *Zones hydrométéorologiques.*

La surface terrestre a été divisée en cinq zones hidrométéorologiques principales (Zones 1 à 5). Ces zones sont représentées sur la figure 8. On trouvera au tableau IV les caractéristiques climatiques de ces zones pour 0,01 % du temps.

4.3. *Calcul de la distance de diffusion par la plui d_r*

4.3.1. *Méthode numérique.*

L'affaiblissement de transmission normalisé se compose de six termes:

$$L_2(0{,}01) = A_1 - A_2 + A_3 - A_4 - A_5 + A_6 \quad (21)$$

où

$$A_1 = 157 + 20 \log d_r - 20 \log f \text{ (dB)} \quad (22)$$

où d_r est la distance de diffusion par la plui (km).

$$A_2 = 26 + 14 \log R - 5{,}88 \times 10^{-5} (d_r - 40)^2 \text{ (dB)} \quad (23)$$

où R est l'intensité de précipitation à la surface de la Terre en mm/h (tableau IV).

On prend 40 km comme distance à l'horizon de la station de Terre.

$$A_3 = 0{,}005 (f - 10)^{1{,}7} R^{0{,}4} \text{ (dB) pour } 10 < f < 40 \text{ GHz} \quad (24a)$$
$$= 0 \text{ (dB) pour } f \leq 10 \text{ GHz} \quad (24b)$$

$$A_4 = 10\ log\left[\frac{2,17}{\gamma D}\left(1 - 10^{-(\gamma D/5)}\right)\right]\ (\text{dB})\ \text{pour}\ f > 5\ \text{GHz} \quad (25a)$$

$$= 0\ (\text{dB})\ \text{pour}\ f \leq 5\ \text{GHz} \quad (25b)$$

où D est le diamètre de la cellule de précipitation en km (tableau IV) et

$$\gamma = 0,008\ R\ (f - 5)\ \text{pour}\ f > 5\ \text{GHz} \quad (26a)$$

$$= 0\ \text{pour}\ f \leq 5\ \text{GHz} \quad (26b)$$

$$A_5 = 10\ \log D\ (\text{dB}) \quad (27)$$

$$A_6 = d_o\beta_o + d_v\beta_v \quad (28)$$

où

$$d_o = 0,7\ d_r + 32\ \text{km pour}\ d_r < 340\ \text{km} \quad (29a)$$

$$= 270\ \text{km pour}\ d_r \geq 340\ \text{km} \quad (29b)$$

$$d_v = 0,7\ d_r + 32\ \text{km pour}\ d_r < 240\ \text{km} \quad (30a)$$

$$= 200\ \text{km pour}\ d_r\ 240\ \text{km} \quad (30b)$$

β_v est donné dans la formule (12), où il faut remplacer ρ par ρ_m (tableau IV).

β_o est donné dans la formule (13).

Ainsi, pour une zone hydrométéorologique donnée, on utilise les paramètres du tableau IV pour calculer la distance de diffusion par la pluie d_r, en appliquent un procédé itératif.

4.3.2. *Méthode graphique.*

Les formules du § 4.3.1 ont été converties sous forme graphique pour donner une autre méthode de détermination de la distance d_r.

Pour calculer la distance de diffusion par la pluie et pour la Zone hydrométéorologique 1, on utilise l'affaiblissement de transmission normalisé obtenu par application de la formule (20) pour la fréquence appropriée (voir la figure 9), d'où l'on déduit la distance de diffusion par la plui d_r.

Les figures 10 à 13 contiennent des courbes correspondant aux zones 2 à 5. Dans tous les cas, on choisit la zone hidrométéorologique correspondant à l'emplacement de la situation terrienne.

4.4. *Distances maximales de diffusion par la pluie.*

Si, lors de la détermination de la distance de diffusion par la pluie pour le mode de propagation (2), on aboutit à des valeurs qui dépassent la valeur appropriée indiquée dans le tableau V, on prendra pour d_r la valeur dudit tableau.

4.5. *Tracé du contour de coordination dans le cas de la diffusion par la pluie.*

En raison de la géométrie de propagation particulière à la diffusion par la pluie, le centre du contour de coordination correspondant à ce mode ne coïncide pas avec l'emplacement de la station terrienne; la distance qui les sépare est désignée par Δd.

On utilise la distance de diffusion par la pluie, d_r, ainsi que l'angle de site ε_s, du faisceau principal de l'antenne de la station terrienne pour déterminer Δd; on utilise la formule:

$$\Delta d = 5,88 \times 10^{-5}\ (d_r - 40)^2\ \text{cotg}\ \varepsilon_s\ (\text{km}) \quad (31)$$

On peut encore déterminer Δd au moyen de la figure 14.

Cette distance Δd est mésurée à partir de la station terrienne, sur une carte tracée à une échelle appropriée, dans l'azimut du faisceau principal de son antenne; on trace un cercle de rayon d_r, ayant pour centre le point ainsi obtenu. Ce cercle est le contour de coordination dans le cas de la diffusion par la pluie.

La distance de coordination dans le cas de la diffusion par la pluie, qu'on appelle d_2, est la distance comprise entre l'emplacement de la station terrienne et le contour de coordination dans l'azimut considéré.

4.6. *Absence d'effets des trajets mixtes.*

Comme le seul effet notable de la diffusion par la pluie est celui qui est produit dans la région de la station terrienne, la question des trajets mixtes ne se pose pas. On tient compte de la zone hydrométéorologique correspondant à la station terrienne ainsi que de la distance maximale appropriée de diffusion par la pluie (tableau V).

5. *Valeurs minimales de la distance de coordination.*

Si la méthode de détermination de la distance de coordination pour le mode de propagation (1) d_1 conduit à un résultat dont la valeur est inférieure à 100 km, d_1 doit être prise égale à 100 km. De même, si la méthode de détermination de la distance de diffusion par la pluie d_r conduit à un resultat dont la valeur est inférieure à 100 km, d_r doit être prise égale à 100 km.

6. *Distance de coordination.*

Dans un azimut quelconque, la plus grande des distances de coordination d_1 ou d_2 est la distance de coordination à utiliser pour la procédure de coordination.

La figure 15 donne un exemple de contour de coordination.

7. *Stations terriennes mobiles (sauf stations mobiles aéronautiques).*

Pour établir s'il y a lieu de rechercher, avec une autre administration, l'accord préalable prévu par les dispositions des numéros **1108** à **1111**, il est nécessaire de déterminer la zone de coordination qui engloberait toutes les zones de coordination relatives à chaque emplacement à l'antérieur de la zone de service dans laquelle on envisage d'exploiter des stations terriennes mobiles.

On peut utiliser la méthode précédente dans ce but en déterminant les contours de coordination individuels appropriés pour un nombre suffisamment élevé d'emplacements, à l'intérieur et à la périphérie de la zone de service proposée et en déterminant à partir de ces contours une zone de coordination composite qui englobe toutes les zones de coordination individuelles possibles.

8. *Révision des données relatives à la propagation.*

Les renseignements données aux sections 3, 4, 6 et dans l'annexe III du présent appendice sont fondés, directement ou indirectement, sur des données de propagation rassemblées, interprétées et illustrées dans les Rapports et les Avis pertinents du CCIR. Les connaissances en matière de propagation sont sujettes à modifications à mesure que l'on dispose de données nouvelles: il peut alors être nécessaire ou vivement recommandé d'apporter des amendements correspondant aux renseignements sur la propagation contenus dans le présent appendice.

La Résolution **60** fixe la marche à suivre pour mettre à jour les éléments du présent appendice ayant trait à la propagation.

TABLEAU I

(1) Les caractéristiques correspondant à ces services peuvent varier dans des limites assez grandes. Un complément d'étude est nécessaire pour fournir des valeurs significatives.

(2) A = modulation analogique; N = modulation numérique.

(3) Voir le note (3) du paragraphe 2, $M_0(p_0)$ peut prendre des valeurs comprises entre 5 dB et 40 dB, selon la fréquence utilisée, la zone hydrométéorologique et la conception du système.

(4) Valeurs estimées pour une bande de largeur 1 Hz, et inférieure de 30 dB à la puissance totale admise pour chaque émission.

(5) Les valeurs enpposent que les largeurs de bande radioélectrique sont d'au moins 100 Mhz, et sont inférieure de 20 dB à la puissance totale admise pour chaque émission.

(6) Dans ces bandes ne a indiqué des caractéristiques des station de Terre correspondant aux système transhorizon. Si une administration estime qu'il n'est pas nécessaire de prendre en considération les systèmes transhorizon, en peut utiliser les caractéristques de falaceaux hertziens à visibiillité directe correspondant à la bande de fréquence 3400-4200 MHz, pour déterminer la zone de coordination conformément au paragraphe 2.3.1.

(7) Dans certains systèmes du service fixe par satellite, il peut être souhaitable de choisir une largeur de bande de référence B plus large lorsque les exigences du système montrent que c'est possible. Cependant, le choix d'une bande plus large entrainers des distances de coordination plus patites et il sera peut être nécessaire de procéder à une nouvelle coordination de la sation terrienne si on décide ultériorement de réduire le bande de référence. Pour les émissions à bande étroite, on doit prendre pour la bande de référence B la même largeur que celle de la bande occupée par la portueuse utile.

(8) Pour le définition de B, voie l'annexe 1.

TABLEAU III

Distance de coordination maximale pour le mode de propagation

	Pourcentage du temps			
	p = 0,001	p = 0,01	p = 0,1	p = 1
Zone A	375	350	300	200
Zone B	1 050	1 000	900	700
Zone C	1 400	1 350	1 200	950

TABLEAU IV

Valeurs caractéristiques des paramètres pour les cinq zones hydrométéorologiques (pour 0,01 % du temps)

Paramètre	Zone hydrométéorologique					Unité
	1	2	3	4	5	
Intensité de précipitacion (R) à surface	75	55	37	26	14	mm/h
Diamètre de la cellule de précipitacion (D)	2,5	2,8	3	3	4,5	km
Densité de la vapeur d'eau (p_m)	10	5	2	2	2	g/m³

TABLEAU V

Distance maximale de diffusion par la pluie (km)

Zone hydrométéorologique	Pourcentage du temps		
	$0{,}001 \leq p < 0{,}01$	$0{,}01 \leq p < 0{,}1$	p = 0,1
1	540	470	390
2	470	390	330
3,4 e 5	390	330	270

- - - - - - - - - - - - Contour pour le mode de propagation (2).
— — — — — — — — Contours auxiliaires pour le mode de propagation (1).

Note. — Si, en utilisant les contours auxiliaires, on constate que, du point de vue du mode de propagation (1), on peut éliminer une station de Terre, il s'ensuit que:

Ai la station de Terre se trouve à l'extérieur du contour correspondant au mode de propagation (2), on peut ne plus en tenir compte;
Ai la station de Terre se trouve à l'intérieur du contour correspondant au mode de propagation (2), ou continuera à en tenir compte, mais pour ce mode seulement.

ANNEXE 1

Détermination et utilisation des contours auxiliaires

1. *Introduction.*

Pour les mécanismes de propagation de long du grand cercle mode (1), les contours auxiliaires sont d'un grand intérêt pour éliminer des études certaines des stations de Terre, existantes ou en projet, qui se trouvent à l'intérieur de la zone de coordination, cela sans avoir à faire des calculs précis et ardus. Aussi, les travaux de l'administration responsable de la station terrienne et ceux des administrations concernées se trouvent facilités, au cours des négociations ultérieures, si ces contours auxiliaires leur sont fournis.

2. *Détermination des contours auxiliaires.*

On peut déterminer deux types de contour, selon que la station terrienne fonctionne comme station d'émission ou de réception.

2.1. *Station terrienne d'émission.*

Dans l'équation (2), on peut isoler le terme $G_r - P_r(p)$ et définir un facteur de sensibilité au brouillage S (dBW) pour les stations de Terre brouillées:

$$S = G_r - P_r(p) \qquad (32)$$

Le tableau I donne des valeurs de ce facteur pour plusieurs types de stations de Terre.

On associe le contour de coordination á un facteur de sensibilité (maximal) S, dont on porte la valeur sur la courbe.

La détermination des contours auxiliaires se fait de la même manière que pour le contour de coordiantion correspondant au mode de propagation (1), mais on utilise pour le facteur de sensibilité au brouillage S (dBV) de la station de Terre des valeurs inférieures de 5, 10, 15, 20 dB, etc., à la valeur (donnée dans le tableau I) qui correspond au contour de coordination.

2.2. *Station terrienne de réception.*

Dans l'équation (2), on peut aussi isoler le terme $P_t \cdot + G_t \cdot$ et définir la p. i. r. e. E (dBW) des stations de Terre brouilleuses:

$$E = P_t \cdot + G_t \cdot$$

dont on trouve des valeurs dans le tableau II.

On associe le contour de coordination à une valeur maximale de E que l'on porte sur la courbe.

La détermination des contours auxiliaires se fait de la même manière que pour le contour de coordination correspondant au mode de propagation (1) mais on utilise, pour la p. i. r. e. E (dBW) de la station de Terre, des valeurs inférieures de 5, 10, 15, 20 dB, etc., à la valeur (donnée dans le tableau II) qui correspond au contour de coordination.

3. *Utilisation des contours auxiliaires.*

Pour une bande partagée donnée, on trace sur le même graphique les contours auxiliaires, le contour de coordination pour la propagation le long du grand cercle, mode (1), et le contour de coordination pour la diffusion par les hydrométéores, mode (2). A titre d'illustration, un exemple est donné à la figure 15.

Pour chaque station de Terre située à l'intérieur de la zone de coordination, on peut appliquer une méthode en deux temps, d'une part pour la propagation le long de l'arc de grand cercle, d'autre-part pour la diffusion par les hydrométéores.

3.1. *Mécanismes de propagation le long du grand cercle — mode (1).*

Si une station de Terre d'émission se trouve à l'intérieur de la zone de coordination correspondant au mode (1), il est inutile d'en tenir compte plus avant en ce qui concerne ce mode.

Pour chaque station de Terre d'émission située à l'intérieur de la zone de coordination correspondant au mode (1), on détermine la p. i. r. e. dans la direction de la station terrienne. Si cette valeur est inférieure à celle qui correspond au contour le plus proche définissant une zone à l'extérieur de lequelle se trouve la station, on peut considérer que celle--ci ne cause pas de brouillage dépassant un niveau admissible, et que par conséquent on n'a pas à en tenir compte plus avant en ce qui concerne le mode (1).

La même méthode peut être appliquée pour chaque station de Terre de récéption, en utilisant le facteur de sensibilité au brouillage en lieu et place de la p. i. r. e.

3.2. *Elimination d'une station de Terre et mécanisme de diffusion par les hydrométéores — mode (2).*

Les stations de Terre qui se trouvent éliminées par la méthode ci-dessus et dont il n'y a plus lieu de tenir compte pour le mode (1) doivent néanmoins être prises en considération pour le mode (2), si ces stations se trouvent à l'intérieur de la zone de coordination pour la diffusion par les hydrométéores.

ANNEXE II

Gain d'antenne pour la direction de l'horizon de la station terrienne par les satellites géostationnaires

1. *Généralités.*

La composante du gain de l'antenne d'une station terrienne dans la direction de l'horizon physique tout autour de la station terrienne est une fonction de l'angle de séparation φ entre l'axe du faisceau principal et la direction de l'horizon considérée. Il s'ensuit qu'il est nécessaire de connaitre l'angle φ pour chaque azimut.

Il existe une relation univoque entre l'angle de site ε, et l'azimut ε, des satellites géostationnaires vus d'une station terrienne qui se trouve à la latitude. La figure II-1 présent, dans un diagramme rectangulaire site/azimut, les portions d'arc possibles de Porbite des satellites géostationnaires: chaque arc correspond à une latitude de station terrienne.

Il est possible quie l'on ne connaisse pas à l'avance les longitudes relatives exactes des satellites. Mais, même si ces longitudes sont connues, la possibilité d'ajouter un nouveau satellite ou la possibilité de déplacer un satellite suggère que tout ou partie de l'arc correspondant doive être considéré comme contenant des satellites.

2. *Méthode de détermination graphique de φ (α):*

Après avoir choisi et marqué l'arc approprié ou la portion d'arc appropriée sur la figure II-1, on superpose comme le montre la fig. II-2 au graphique de la fig II-1 le tracé de l'horizon φ (α). On en a un exemple dans la figure II-2 pour une station terrienne située à 45° de latitude Nord et pour un satellite que l'on envisage de placer entre les longitudes relatives 10° Est et 45° Ouest.

Pour chaque point situé sur l'horizon local ε (α), on détermine et on mesure la plus courte distance à l'arc, sur l'échelle des angles de site. L'exemple de la figure II-2 montre comment on détermine l'angle hors faisceau φ pour un azimut α (= 210°), avec un angle de site ε (= 4°). La mesure donne pour φ la valeur 26°.

Si l'on opère ainsi pour tous les azimuts (par échelons appropriés, par exemple de 5° en 5°), on obtient une relation φ (α).

3. *Méthode de détermination numérique de* $\varphi(\alpha)$:

On utilise alors les formules suivantes:

$$\psi = \text{arc cos } (\cos \zeta \cdot \cos \delta); \quad (34)$$

$$\alpha'_s = \text{arc cos } (\text{tg } \zeta \cdot \text{cotg } \psi); \quad (35)$$

$\alpha_s = \alpha'_s + 180°$ pour des stations terriennes situées dans l'hémisphère nord et des satellites situés à l'ouest de la station terrienne; (36a)

$\alpha_s = 180° - \alpha'_s$ pour des stations terriennes situées dans l'hémisphère nord et des satellites situés à l'est de la station terrienne; (36b)

$\alpha_s = 360° - \alpha'_s$ pour des stations terriennes situées dans l'hémisphère sud et des satellites situés à l'ouest de la station terrienne; (36c)

$\alpha_s = \alpha'_s$ pour des stations terriennes situées dans l'hémisphère sud et des satellites situés à l'est de la station terrienne; (36d)

$$\varepsilon_s = \text{arc tg } \left(\frac{K - \cos \psi}{\sin \psi}\right) - \psi; \quad (37)$$

$$\varphi(\alpha) = \text{arc cos } [\cos \varepsilon \cdot \cos \varepsilon_s \cdot \cos (\alpha - \alpha_s) + \sin \varepsilon \cdot \sin \varepsilon_s]. \quad (38)$$

où:

ζ — latitude de la station terrienne;
δ — différence de longitude entre le satellite et la station terriene;
ψ — arc du grand cercle entre la station terrienne et le point à la verticale du satellite;
α_s — azimut du satellite vu de la station terrienne;
ε_s — angle de site du satellite vu la station terrienne;
α — azimut de la direction considérée;
ε — angle de site de l'horizon dans l'azimut α considéré;
$\varphi(\alpha)$ — angle entre l'axe du faiceau principal et la direction de l'horizon correspondant à l'azimut α considéré;
K — rapport du rayon de l'orbite au rayon de la Terre, égal à 6,62.

Tous les arcs ci-dessus mentionnés sont exprimés en degrés.

4. *Détermination du gain d'antenne.*

On peut utiliser la relation $\varphi(\alpha)$ pour obtenir le gain d'antenne dans la direction de l'horizon G (dB), en fonction de l'azimut α, à l'aide du diagramme de rayonnement effectif de l'antenne de la station terrienne ou par application d'une formule donnant une bonne aproximation. Par exemple, dans les cas où le rapporte entre le diamètre de l'antenne et la longueur d'onde est supérieur ou égal à 100, il convient d'utiliser la formule:

$$G(\varphi) = G_{max} - 2{,}5 \times 10\text{-}3 \left(\frac{D}{\lambda}\varphi\right)^2 \quad \text{pour } 0 < \varphi < \varphi_m \quad (39a)$$

$$G(\varphi) = G_1 \text{ pour } \varphi_m \leq \varphi < \varphi_r \quad (39b)$$

$$G(\varphi) = 32\text{-}25 \log \varphi \text{ pour } \varphi_r \leq \varphi < 48° \quad (39c)$$

$$G(\varphi) = -10 \text{ pour } 48° \leq \varphi \leq 180° \quad (39d)$$

où

D = diamètre de l'antenne
λ = longueur d'onde
} exprimés dans la même unité;

G_1 = gain du premier lobe latéral = $2 + 15 \log \frac{D}{\lambda}$.

$$\varphi_m = \frac{20\lambda}{D}\sqrt{G_{max} - G_1} \text{ (degrés)}$$

$$\varphi_r = 15{,}85 \left(\frac{D}{\lambda}\right)^{-0{,}6} \text{ (degrés)}$$

Pour les antennes dont le rapport $\frac{D}{\lambda}$ est inférieur à 100, lorqu'il n'est pas possible d'utiliser le diagramme de rayonnement de référence susmentionné et qu'on ne peut avoir recours à sa place ni à une donnée mesurée nu à un Avis pertinent du CCIR, accepté par les administrations concernées, les administrations peuvent utiliser le diagramme de référence représenté par:

$$G(\varphi) = G_{max} - 2{,}5 \times 10\text{-}3 \left(\frac{D}{\lambda}\varphi\right)^2 \quad \text{pour } 0 < \varphi < \varphi_m \quad (40a)$$

$$G(\varphi) = G_1 \text{ pour } \varphi_m \leq \varphi < \varphi < 100 \frac{\lambda}{D} \quad (40b)$$

$$G(\varphi) = 52 - 10 \log \frac{D}{\lambda} - 25 \log \varphi \text{ pour } 100 \frac{D}{\lambda} \leq \varphi < 48° \quad (40c)$$

$$G(\varphi) = 10 - 10 \log \frac{D}{\lambda} \text{ pour } 48° \leq \varphi \leq 180° \quad (40d)$$

où

D = diamètre de l'antenne
λ = longueur d'onde
} exprimés dans la même unité;

G_1 = gain du premier lobe latéral = $2 + 15 \log \frac{D}{\lambda}$.

$$\varphi_m = \frac{20\lambda}{D}\sqrt{G_{max} - G_1} \text{ (degrès)}$$

Les diagrammes ci-dessus peuvent être modifiés selon le cas pour obtenir une meilleure représentation du diagramme de rayonnement réel.

Dans les cas où $\frac{D}{\lambda}$ n'est pas donné, il peut être estimé à partir de l'expression $20 \log \frac{D}{\lambda} \approx G_{max} - 7{,}7$, dans laquelle G_{max} est, en dB, le gain du lobe principal de l'antenne.

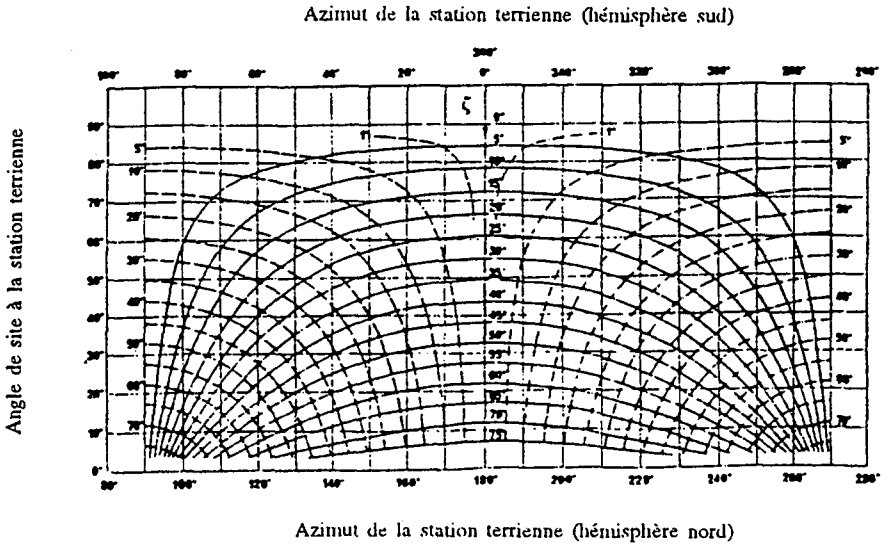

Figure II-1 — Arcs contenant les positions des satellites géostationnaires

..... Longitude du satellite égale à la longitude de la station terrienne.

ANNEXE III

Méthode graphique de détermination de la distance de coordination dans le cas des trajets mixtes

1. *Deux zones.*

La méthode à utiliser dans le cas d'un trajet mixte mettant en jeu deux zones est illustrée par l'exemple de la figure III-1(a). La station terrienne est située dans la Zone A à une distance de 75 km de la Zone B. La méthode graphique décrite ci-dessus est particulièrement utile quand il y a, comme dans cet exemple, plus d'une frontière entre zones.

Dans l'exemple ci-dessus, on suppose que l'affaiblissement de coordination est de 180 dB, la fréquence de 20 GHz et le pourcentage du temps de 0,01 %. La suite des opérations est la suivante:

1.1. Déterminer la distance qui, entièrement dans la Zone A, donnerait la valeur de l'affaiblissement de coordination; reporter cette distance (ici 160 km), à partir de l'origine, sur l'axe des abscisses d'une feuille de papier milimétré, ce qui donne le point A [fig. III-1(b)].

1.2. Déterminer la distance qui, entièrement dans la Zone B, donnerait la même valeur de l'affaiblissement de coordination; reporter cette distance (ici 530 km), à partir de l'origine, sur l'axe des ordonnées de la même feuille, ce qui donne le point B.

1.3. Joindre les points A et B par un segment de droite;

1.4. Porter sur l'axe des abscisses, à partir de l'origine, la distance de 75 km entre la station terrienne et la Zone B, ce qui donne le point A_1.

1.5. Partant du point A_1, porter parallèlement à l'axe des ordonnées la distance de 150 km entièrement comprise dans la Zone B, ce qui donne le point B_1.

1.6. La distance qui reste à parcourir dans la deuxième partie de la Zone A se détermine en menant de B_1 une parallèle à l'axe des abscisses jusqu'au point X où elle rencontre la courbe à utiliser dans le cas d'un trajet mixte. Sur la figure III-1(b), on lit: $B_1 X = 40$ km.

1.7. La distance de coordination est la somme des distances $0A_1$, A_1B_1 et B_1X, soit:

$$75 + 150 + 40 = 265 \text{ km}$$

2. *Trois zones.*

Dans certains cas particuliers, le trajet mixte traverse les trois zones radioclimatiques A, B et C. On peut résoudre le problème en ajoutant une troisième dimension à la méthode suivie dans le cas où le trajet mixte de traverse que deux zones. Théoriquement, cela revient à dire que l'on doit chercher la troisième coordonée d'un point dont les deux premières coordonnées correspondent aux distances connues dans les deux premières zones et qui se trouve dans le plan passant par les trois points des axes 0x, 0y et 0z correspondant aux distances qui, dans les Zones A, B et C respectivement, donneraient la valeur requise de l'affaiblissement de transmission de référence.

Dans la pratique, on peut ramener cette détermination à la méthode graphique simple représentée sur la figure III-2(a) pour laquelle on suppose par exemple que l'affaiblissement de coordination (L_1) est égal à 180 dB pour une fréquence de 20 GHz. Le problème consiste à trouver la distance de coordination à partir de la station terrienne dans la direction indiquée sur la figure III-2(a). Dans cette direction et à partir de 0, station terrienne située dans la Zone A, la longueur du trajet dans la Zone A est de 75 km ($0A_1$); elle est suivie d'une longueur de 150 km dans la Zone B (A_1B_1), dans la même direction, puis d'une longueur inconnue qu'il s'agit précisément de déterminer dans la Zone C [figure III-2(a)].

La méthode à appliquer est alors la suivante [figure III-2(b)]:

2.1. Commencer par appliquer la même méthode que dans le cas où deux zones seulement sont en jeu, en appliquant seulement les étapes 1.1 à 1.5 et continuer comme suit.

2.2. Du point B_1, tracer une parallèle à la droite AB; elle coupe l'axe des abscisses en D.

2.3. Déterminer la distance qui, située toute entière dans la Zone C, donnerait la même valeur de l'affaiblissement de coordination. Porter cette distance (ici: 350 km) sur l'axe des ordonnées en 0C. Joindre les points C et A par un segment de droite.

2.4. Du point D, tracer la parallèle à l'axe des ordonnées; elle coupe CA en X.

2.5. La distance DX est la longueur cherchée du trajet dans la zone C: on trouve qu'elle est égale à 85 km.

2.6. La distance de coordination est la somme des longueurs OA_1, A_1B_1 et DX. Elle vaut:

$$75 + 150 + 85 = 310 \text{ km}$$

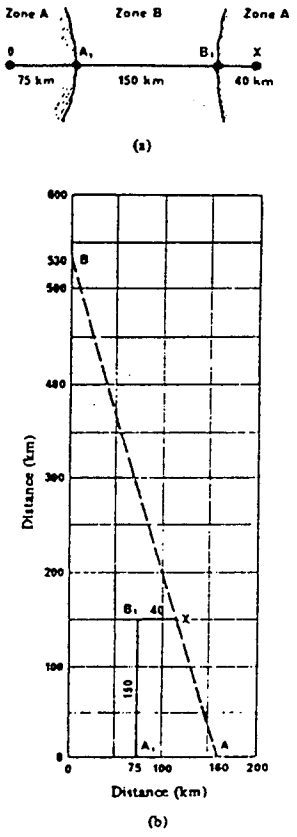

Figure III-1 — Exemple de détermination de la distance de coordination dans le cas d'un trajet mixte mettant en jeu les Zones A et B

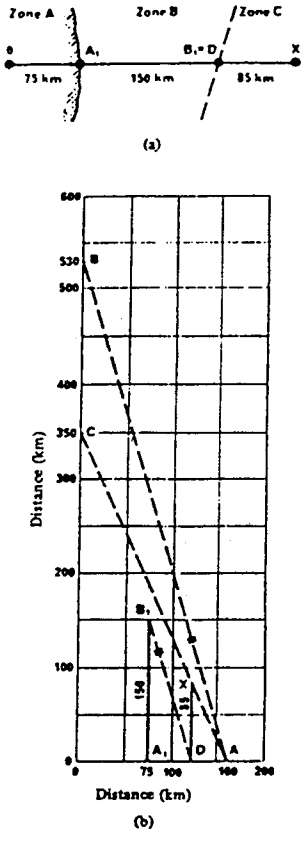

Figure III-2 — Exemple de détermination de la distance de coordination dans le cas d'un trajet mixte mettant en jeu les Zones A, B et C

MOD **AP29** APPENDICE 29

Méthode de calcul pour déterminer si une coordination est nécessaire entre des réseaux á satellite géostationnaire partageant les mêmes bandes de fréquences

1. Introduction.

La méthode de calcul pour déterminer si une coordination est nécessaire selon le numéro **1060** repose sur le fait que la température de bruit d'un systéme brouillé augmente avec le niveau de l'émission brouilleuse. Cette méthode est donc applicable quelles que soient les caractéristiques de modulation des réseaux à satellite en jeu, et quelles que soient les fréquences exactes qu'ils utilisent.

Selon cette méthode, on calcule pour une liaison par satellite donnée l'accroissement apparent de la température de bruit équivalente, résultante de l'émission brouilleuse d'un système donné (voir § ci-dessous), et on compare le rapport exprimé en pourcent entre cet accroissement et la température de bruit équivalent de la liaison à une valeur limite (voir § 3 ci-dessous).

2. *Calcul de l'accroissement apparent de la température de bruit équivalent d'une liaison par satellite subissant un brouillage.*

On considère deux cas possibles:

Cas I — réseaux utile et brouilleur partageant une ou plusieurs bandes de fréquences, chacune dans le même sens de transmission;

Cas II — réseaux utile et brouilleur partageant une ou plusieurs bandes de fréquences, chacune dans les sens de transmission opposés (utilisations bidirectionnelle).

Ces deux cas sont applicables à toutes les positions relatives des satellites depuis des positions rapprochées jusqu'à des positions quasi-antipodales.

2.1. *Notations.*

Soit A une liaison par satellite du réseau R associé au satellite S et A' une liaison por satellite du réseau R' associé au satellite S'. Les symboles relatifs à la liaison par sattelite A' sont affectés de la notation prime et ceux relatifs à la liaison par satellite A n'en sont pas effectés.

Les notations utilisées pour la liaison par satellite A sont les suivantes:

T — température de bruit équivalente de la liaison par satellite, rapportée à la sortie de l'antenne de réception de la station terrienne (K);

T_s — température de bruit du système de réception de la station spatiale, rapportée à la sortie de l'antenne de réception de la station spatiale (K);

T_e — Température de bruit du systéme de réception de la station terrienne, rapportée à la sortie de l'antenne de réception de la station terrienne (K);

ΔT_s — accroissement apparent de la température de bruit du système de réception du satellite S causé par une émission brouilleuse, rapporté à la sortie de l'antenne de réception de ce satellite (K);

ΔT_e — accroissement apparent de la température de bruit du système de réception de la station terrienne e_R, causé par une émission brouilleuse, rapporté à la sortie de l'antenne de réception de cette station (K);

p_s — densité maximale de puissance par Hz fournie à l'antenne du satellite S (moyenne prise dans da bande de 4 kHz la plus défavorisée lorsque la fréquence de la porteuse est inférieure à 15 GHz, ou prise dans la bande de 1 MHz la plus défavorisée lorsque la fréquence de la porteuse est supérieure à 15 GHz) (W/Hz);

$g_3(\eta)$ — gain de l'antenne d'emision du satellite S dans la direction η (rapport numérique de puissance);

η_A — direction, à partir du satellite S, de la station terrienne de réception e_R pour la liaison par satellite A;

η_e — direction à partir du satellite S, de la station terrienne de réception e'_R pour la liaison par satellite A';

Note —Le produit $p_s\ g_3(\eta_e)$ est la p. i. r. e. maximale par Hz du satellite S dans la direction de la station terrienne de réception e'_R pour la liaison par satellite S';

η_S — direction, à partir du satellite S, du satellite S';

P_c — densité maximale de puissance par Hz fournie à l'antenne de la station terrienne d'émission e_R (moyenne prise dans la bande de 4 kHz la plus défavorisée lorsque la fréquence de la porteuse est inférieure à 15 GHz, ou prise dans la bande de 1 MHz la plus défavorisée lorsque la fréquence de la porteuse est supérieure à 15 GHz) (W/Hz);

$g_2(\delta)$ — gain de l'antenne de réception du satellite S, dans la direction δ (rapport numérique de puissances);

δ_A — direction, à partir du satellite S, de la station terrienne d'émission e_T pour la liaison par satellite A;

$\delta_{e'}$ — direction, à partir du satellite S, de la station terrienne d'émission e'_T pour la liaison par satellite A';

$\delta_{S'}$ — direction, à partir du satellite S, du satellite S';

θ_t — écart angulaire topocentrique en degrés entre les deux satellites (1), compte tenu des tolérances longitudinales de maintien en position;

Note. — Seul l'angle topocentrique θ_t, doit être utilisé dans le traitement du cas I.

θ_g — écart angulaire géocentrique en degrés entre les deux satellites, compte tenu des tolérances longitudinales de maintien en position;

Note. — Seul l'angle géocentrique θ_g doit être utilisé dans le traitement du cas II.

$g_1(\theta_t)$ — gain de l'antenne d'émission de la station terrienne e_T dans la direction du satellite S' (rapport numérique de puissances);

$g_4(\theta_t)$ — gain de l'antenne de réception de la station terrienne e_R dans la direction du satellite S' (rapport numérique de puissances);

k — constante de Boltzmanne ($1{,}38 \times 10^{-23}$ J/K);

I_d — affaiblissement de transmission en espace libre (2) sur la liaison descendante (rapport numérique de puissances), entre le satellite S et la station terrienne de réception e_R pour la liaison par satellite A;

Note. — On consideré que l'affaiblissement de transmission en espace libre sur une liaison descendante quelconque, entre satellites S ou S' et les stations terriennes de réception e_R ou e'_R, est égal à I_d.

I_u — affaiblissement de transmission en espace libre (2) sur la liaison montante (rapport numérique de puissances), entre la station terrienne e_T et satellite S pour la liaison par satellite A;

Note. — On consideré que l'affaiblissement de transmission en espace libre sur une liaison montante quelconque, entre les stations terriennes e_T ou e'_T et les satellites S ou S', est égal à I_u.

I_S — affaiblissement de transmission en espace libre (2) sur la liaison inter-satellite (rapporte numérique de puissances) entre le satellite S' et le satellite S;

γ — gain de transmission d'une liaison spécifique par satellite subissante un brouillage, évalué entre la sortie de l'antenne de réception du satellite S et la sortie de l'antenne de réception de la station terrienne e_R (rapport numérique de puissances, habituellement inférieur à 1).

2.2. *Méthode générale.*

Dans les expressions qui suivent, la fréquence à utiliser pour le calcul de I_d, I_u et I_s est la fréquence moyenne de la bande commune aux deux réseaux dans le sens consideré. Si, dans un sens donné, il n'y a pas de chevauchement entre les bandes de fréquences assignées aux deux réseaux, la valeur correspondante (ΔT_s ou ΔT_e) est prise comme étant égale à zéro. Dans le cas où, pour un réseau, les données de l'appendice 3 n'ont pas été publiées, la bande de fréquences assignée à ce réseau este considerée étant la gamme de fréquences publiée au titre de l'appendice 4.

2.2.1. Cas I —*Réseaux utile et brouiller partageant une bande de fréquences dans le même sens de transmission.*

Les gains $g_1(\theta_1)$ et $g_4(\theta_1)$ sont ceux des stations terriennes considérées. Lorsqu'on ne dispose ni de données mesurées ni d'un Avis pertinent du CCIR accepté par les administrations concernées, il faut utiliser les diagrammes de rayonnement donnés dans l'annexe III.

2.2.1.1. *Simple répéteur-changeur de fréquence à bord du satellite.*

ΔT et ΔT_e peuvent être calculés d'aprés les expressions suivantes:

$$\Delta T_s = \frac{p'_e g'_1(\theta_t)\, g_2(\delta_e)}{K l_u} \tag{1}$$

$$\Delta T_e = \frac{p'_e g'_3(\eta_e)\, g_4(\theta_t)}{K l_d} \tag{2}$$

On utilise le symbole ΔT pour représenter l'accroissement apparent, causé par l'émission brouilleuse de la liaison A', de la température de bruit équivalente pour la liaison par satellite tout entière rapportée à la sortie de l'antenne de réception de la station terrienne de réception e_R.

Cet accroissement de la température de bruit résulte des émissions brouilleuses qui affectent à la fois le récepteur du satellite de la liaison A et celui de la station terrienne de cette liaison. On peut done écrire:

$$\Delta T = \gamma \Delta T_s + \Delta T_e \tag{3}$$

(1) L'annexe I décrit une méthode de calcul de l'écart angülaire topocentrique.

(2) L'annexe II décrit une méthode de calcul de l'affaiblissement de transmission en espace libre.

d'où:

$$\Delta T = \gamma \frac{p'_e g'_1(\theta_e) g_2(\delta_e)}{kl_u} + \frac{p'_e g'_3(\eta_e) g_4(\theta_1)}{kl_d} \quad (4)$$

On trouvera à l'annexe IV un exemple de calcul pour l'application dans de cas I, de la méthode formulée dans le présent appendice.

On peut obtenir de la même façon la valeur $\Delta T'$ de l'accroissement de la température de bruit équivalent pour la liaison par satellite tout entière, rapportée à la sortie de l'antenne de réception de la station terrienne de réception e'_R subissant les brouillages causés par la liaison par satellite A, en utilisant les expressions suivantes:

$$\Delta T'_s = \frac{p_e g_1(\theta_e) g'_2(\delta_e)}{Kl_u} \quad (5)$$

$$\Delta T'_e = \frac{p_e g_3(\eta_e) g'_4(\theta_1)}{Kl_d} \quad (6)$$

$$\Delta T'_e = \gamma \frac{p'_e g_1(\theta_1) g'_2(\delta_e)}{kl_u} + \frac{p'_e g'_3(\eta_e) g'_4(\theta_e)}{kl_d} \quad (7)$$

2.2.1.2. *Cas nécessitant un traitement séparé de la liaison montante et de la liaisons descendante.*

S'il y a un changement de modulation à bord du satellite ou si la transmission a lieu à partir du satellite, l'accroissement apparent de la température de bruit doit être rapporté à la température totale de bruit du système de réception de la liaison considerée (à la station spatiale ou à la station terrienne, selon le cas). En pareil cas, la température de bruit équivalent de la liaison totale par satellite et le gain de transmission ne sont pas utilisés et les expressions (1) et (2) ci-dessus sont utilisées séparément comme il convient (voir le § 2.3).

2.2.2. Cas II — *Réseaux utile et brouiller partageant une bande de fréquences dans des sems de transmission opposés (utilisation bidirectionnelle).*

La méthode de calcul ci-dessous ne s'applique qu'aux émissions brouilleuses entre satellites.

Les brouillages entre les stations terriennes utilisant une même bande de fréquences dans des sens de transmission opposés (utilisation bidirectionnelle) doivent être traités selon des méthodes de coordination analogues à celles utilisées pour la coordination entre stations terriennes et stations de Terre.

Toutes les expressions relatives au cas II doivent utiliser l'angle géocentrique θg.

2.2.2.1. *Simple répéteur-changeur de fréquence à bord du satellite.*

L'accroissement de la température de bruit ΔT_s, rapporté à la sortie de l'antenne de réception du satellite de la liaison Δ est donné par:

$$\Delta T_s = \frac{p'_s g'_3(\eta_s) g_2(\delta_s)}{Kl_s} \quad (8)$$

L'accroissement apparent de la température de bruit équivalent de la liaison est alors donné par:

$$\Delta T = \gamma \Delta T_s \quad (9)$$

La valeur $\Delta T'$ de l'accroissement de la température de bruit équivalent de la liaison A' causé par les émissions brouilleuses du satellite associé à la liaison A est donnée par:

$$\Delta T' = \gamma \Delta T'_s = \frac{\gamma' P_s g_3(\eta_s) g'_2(\delta_s)}{KL_s} \quad (10)$$

2.2.2.2. *Cas nécessitant un traitement séparé de la liaison montante et de la liaisons descendante.*

Dans ce cas, on utilise directement l'expression (8) avec T_s, pour obtenir le pourcentage d'accroissement. La valeur $\Delta T'_s$ de l'accroisement de la température de bruit de la liaison A' causé par les émissions brouilleuses du satellite associé à une liaison A s'obtient de la même façon.

2.2.3. *Prise en compte éventuelle de la discrimination de polarisation.*

Le facteur de discrimination de polarisation décrit dans ce paragraphe doit être pris en considération seulement si chacune des administrations responsables des réseaux a été d'accord pour cela et a notifié sa polarisation, ou l'a publiée, aux

fins de coordination conformément aux dispositions du numéro **1060**. Dans ce cas, l'accroissement apparent de la température de bruit équivalent de la liaison s'obtient par les formules ci-après:

Cas I:

$$\Delta T = \frac{\gamma \Delta T_s}{Y_u} + \frac{\Delta T_e}{Y_d}$$

Cas II:

$$\Delta T = \frac{\gamma \Delta T_s}{Y_{ss}}$$

où ΔT_s et ΔT_e ont les valeurs données en 2.2.1 et 2.2.2 et les valeurs des facteurs de discrimination de polarisation Y_u, Y_d et Y_{ss} sont données para le tableau ci-dessous:

Polarisation		Facteur de discrimination de polarisation (rapport numérique $\overline{Y}$)
Réseau *R*	Réseau *R'*	
CG	*CD*	4
CG	*R*	1,4
CD	*R*	1,4
CG	*CG*	1
CD	*CD*	1
R	*R*	1

où:

CG = circulaire gauche (levogyre);
CD = circulaire droite (dextrogyre);
R = rectiligne.

2.3. *Détermination des liaisons par satellite à pendre en considération pour le calcul de l'accroissement de la température de bruit équivalente (cas I seulement).*

Il faut déterminer le plus grand accroissement de température de bruit équivalente causé à n'importe quelle liaison de tout réseau à satellite existant ou en projet, sous l'effet des émissions brouilleuses du réseau à satellite considéré.

Pour chaque antenne de réception du satellite du réseau brouillé, il convient de déterminer l'emplacement le plus défavorable de la station terrienne d'émission du réseau brouilleur en superposant, sur une carte de la surface terrestre, les zones de service «Terre vers espace» du réseau brouilleur aux contours de gain de l'antenne de réception de la station spatiale. L'emplacement le plus défavorable de la station terrienne d'émission est celui en direction duquel le gain de l'antenne de réception du satellite du réseau brouillé est le plus élevé.

De même, pour chaque zone de service «espace vers Terre» du réseau brouillé, il convient de déterminer de façon analogue l'emplacement le plus défavorable de la station terrienne de réception de ce réseau. L'emplacement le plus défavorable de la station terrienne de réception est celui en direction duquel le gain de l'antenne d'émission du satellite du réseau brouilleur est le plus élevé.

2.4. *Utilisation des renseignements fournis au tire d l'appendice* **4**.

Lorsqu'une administration décide d'utiliser les renseignements fournis au titre de l'appendice **4** avec les procédures de calcul décrites dans les sections 2.2.1.1 et 2.2.2.1, en vue de formuler des observations concernant la publication anticipée d'un nouveau réseau, les calculs doivent être effectués pour les deux séries de valeurs fournies pour γ et T. La plus grande des deux valeurs de $\Delta T/T$ résultant de ces calculs est celle qu'il convient d'utiliser.

3. *Comparaison entre l'accroissement relatif calculé de la température de bruit et la valeur de seuil.*

3.1. *Simple répéteur-changeur de fréquence à bord du satellite.*

Les valeurs calculées de $\frac{\Delta T}{T}$ et $\frac{\Delta T'}{T'}$, exprimées en pourcent, doivent être comparées à la valeur de seuil de 4 %.

Si la valeur calculée de $\frac{\Delta T}{T}$, exprimée en pourcent, due à tout émission brouilleuse causée par la liaison A' à la liaison A, n'est pas supérieure à la valeur de seuil, une coordination en ce qui concerne le brouillage de la liaison A por la liaison A' n'est pas nécessaire.

Si la valeur calculée de $\frac{\Delta T}{T}$, exprimée en pourcent, est supérieure à la valeur de seuil, une coordination est nécessaire.

La comparaison entre la valeur calculée de $\frac{\Delta T'}{T'}$ et la valeur de seuil, exprimées en pour cent, doit être faite de la même façon.

3.2. *Cas nécessitant un traitement sépare de la liaison montante et de la liaison descendante.*

a) Dans un cas de brouillage affectant une seule liaison, la liaison montante ou la liaison descendente, la valeur de $\Delta T_e/T_e$ ou de $\Delta T_s/T_s$, exprimée en pourcent, doit être comparée à la valeur de seuil de 4 %;

b) Dans un cas de brouillage affectant à la fois la liaison montante et la liaison descendante, entre lesquelles il y a un changement de modulation à bord du satellite, leurs valeurs de $\Delta T_e/T_e$ et de $\Delta T_s/T_s$, exprimées en pourcent, doivent être comparées à la valeur de seuil de 4 %.

Lorsqu'aucune des valeurs calculées dues à toute émission brouillage causée par la liaison A' à la liaison A n'est supérieure à la valeur de seuil, une coordination en ce qui concerne le brouillage de la liaison A par la liaison A' n'est pas nécessaire.

Si l'une au moins des valeurs calculées est supérieure à la valeur de seuil, une coordination est nécessaire.

La comparaison des valeurs de $\frac{\Delta T_e'}{T_e'}$ ou de $\frac{\Delta T_s'}{T_s'}$, exprimés en pourcent, avec la valeur de seuil doit être faite de la même façon.

4. *Examen des porteuses à bande étroite.*

Il se peut que la méthode de calcul décrite dans cet appendice sous-estime le brouillage causé à certaines émissions à bande étroite (à une seule voie par porteuse — SCPC) par des émissions de télévision à balayage lent.

Pour faciliter la procédure de coordination entre systèmes à satellite et réduire le nombre des administrations impliquées dans cette procédure, les administrations dont les assignations à des stations utilisant des systèmes SCPC sont soit inscrites dans le Fichier de référence, soit en cours de coordination, peuvent faire connaître à l'administration qui notifie une nouvelle assignation les canaux radioélectriques utilisés dans leurs systèmes pour les émissions SCPC. L'administration notificatrice peut ainsi, le cas échéant, éviter d'employer ces canaux pour les émissions de télévision à modulation de fréquence.

Réciproquement, les administrations qui prévoient de nouveaux systèmes à émissions SCPC peuvent chercher à obtenir auprès d'autres administrations les renseignements appropriés sur leurs émissions de télévision à modulation de fréquence.

ANNEXE I

Calcul de l'écart angulaire topocentrique entre deux satellites géostationnaires

L'écart angulaire topocentrique θ, entre deux satellites géostationnaires à partir d'une station terrienne donnée peut être calculé à l'aide de la formule:

$$\theta_t = \text{arc cos} \left[\frac{d_1^2 + d_2^2 - \left(84\,332 \sin \frac{\theta_s}{2}\right)^2}{2\,d_1 \cdot d_2} \right]$$

dans laquelle d_1 et d_2 sont les distances respectives, en km, entre la station terrienne et les deux satellites, évaluées par la méthode décrite pour le calcul de d dans l'annexe II, et θ_s a la valeur définie au § 2.1.

ANNEXE II

Calcul de l'affaiblissement de transmission en espace libre

L'affaiblissement de transmission L en espace libre peut être calculé à l'aide de la formule:

$$L = 20\ (\log f + \log d) + 32{,}45\ \text{(dB)}$$

dans laquelle:

f — Fréquence (MHz);
d — Distance (km).

a) La distance d entre une station terrienne et un satellite géostationnaire est donnée par la formule:

$$d = 42\,644\ \sqrt{1 - 0{,}2954 \cos \psi}\ \text{(km)}$$

dans laquelle:

$$\cos \psi = \cos \zeta \times \cos \beta$$

où:

ζ — Latitude de la station terrienne;
β — Différence de longitude entre le satellite et la station terrienne.

Remarque — Si $\cos \psi < 0{,}151$, le satellite est au-dessus du plan horizontal.

b) La distance d_s entre deux satellites géostationnaires est donnée par:

$$d_s = 84\,322 \sin \frac{\theta_g}{2} \text{ (km)}$$

θ_g — Écarte angulaire géocentrique, selon la définition donnée au § 2.1.

ANNEXE III

Diagrammes de rayonnement à utiliser pour les antennes de station terrienne lorsqu'ils ne sont pas publiés

S'il n'existe ni données mesurées ni Avis pertinent du CCIR acceptés par les administrations concernées, celles-ci doivent utiliser les diagrammes de référence représentés, en dB, par:

a) Pour des valeurs de $\frac{D}{\lambda} \geq 100$ (1) (gain maximum ≥ 48 dB environ):

$G(\varphi) = G_{max} - 2{,}5 \times 10^{-3} \left(\frac{D}{\lambda}\varphi\right)^2$ pour $0 < \varphi < \varphi_m$
$G(\varphi) = G_1$ pour $\varphi_m \leq \varphi < \varphi_r$
$G(\varphi) = 32 - 25 \log \varphi$ pour $\varphi_r \leq \varphi < 48°$
$G(\varphi) = -10$ pour $48° \leq \varphi < 180°$

où

D — Diamètre de l'antenne
λ — Longueur d' onde
} exprimés dans la même unité;
φ — Angle par rapport à l'axe principal de l'antenne en degrés, égal à 0, ou θ_g, selon le cas;
G_1 — Gain du premier lobe latéral = $2 + 15 \log \frac{D}{\lambda}$

$$\varphi_m = \frac{20\lambda}{D} \sqrt{G_{max} - G_1} \text{ (degrés)}$$
$$\varphi_r = 15{,}85 \left(\frac{D}{\lambda}\right)^{-0.6} \text{ (degrés)}$$

b) Pour les valeurs de $\frac{D}{\lambda} < 100$ (1) (gain maximum < 48 dB environ):

$G(\varphi) = G_{max} - 2{,}5 \times 10^{-3} \left(\frac{D}{\lambda}\varphi\right)^2$ pour $0 < \varphi < \varphi_m$
$G(\varphi) = G_1$ pour $\varphi_m \leq \varphi < 100 \frac{\lambda}{D}$
$G(\varphi) = 52 - 10 \log \frac{D}{\lambda} - 25 \log \varphi$ pour $100 \frac{\lambda}{D} \leq \varphi < 48°$
$G(\varphi) = 10 - 10 \log \frac{D}{\lambda}$ pour $48° \leq \varphi \leq 180°$

Les diagrammes ci-dessus peuvent être modifiés si nécessaire pour obtenir une meilleure représentation du diagramme de rayonnement réel.

ANNEXE IV

Exemple d'application de l'appendice 29

1. *Considérations générales:*

Dans le présent exemple relatif au cas I (voir le § 2.2.1), on admet, par hypothèse, deux réseaux à satellite identiques comportant chacun un simple répéteur-changeur de fréquence et une antenne à couverture mondiale.

Tous les angles topocentriques θ_t sont supposés avoir une valeur de 5°.

Pour cet écart angulaires et pour une antenne de station terrienne dont le rapport $\frac{D}{\lambda}$ est plus grand que 100, le diagramme de rayonnement de référence ($32 - 25 \log \theta_t$) indique un gain de 14,5 dB dans la direction du satellite de l'autre réseau.

Les données de départ, indiquées dans le § 2 ci-dessus, sont exprimés en décibels, exception faite pour les paramètres T et θ_t. Dans le § 3 ci-dessus, les calculs sont effectués en décibels.

(1) Dans les cas où $\frac{D}{\lambda}$ n'est pas donné, il peut être évalué à partir de l'expression $20 \log \frac{D}{\lambda} \approx G_{max} - 7{,}7$ dans laquelle G_{max} est, en dB, le gain du lobe principal de l'antenne.

On peut noter que, puisque les deux satellites utilisent des faisceaux à couverture mondiale, l'antenne du satellite n'aporte pratiquement pas de discrimination entre le signal utile et le signal brouilleur; il s'agit donc d'un cas défavorable à l'extrême.

2. *Données de départ:*

Les valeurs des caractéristiques du réseau données dans le tableau ci-dessus sont tirées des valeurs publiées au titre de l'appendice 3 ou de l'appendice 4.

	Symbole (a)	Valeur	Unité
Liaison montante à 6175 MHz	P'_e	— 37	dB (W/Hz)
	$G'_1(0_r)$	14,5	dB
	$G_2(\delta_e)$	15,5	dB
	L_u	200	dB
Liaison descendante à 3950 MHz	P'_s	— 57	dB (W/Hz)
	$G'_3(\eta_e)$	15,5	dB
	$G_4(0_r)$	14,5	dB
	L_d	196	dB
—	10 log γ	— 15	dB
	T	105	K
	θ_r	5	degrés

(a) Tous les symboles en lettres majuscules, à l'exception de T, se rapportent aux caractéristiques données en unités logarithmiques.

3. *Calcul de* $\frac{\Delta T}{T}$.

A partir de la formule (1):

$$10 \log \Delta T_s = P_e + G_1(\theta_r) + G_2(\delta_e) + 228{,}6 - L_u$$
$$= -37 + 14{,}5 + 15{,}5 + 228{,}6 - 200 = 21{,}6 \text{ dBK}$$

on obtient:

$$\Delta T_s = 145 \text{ K}$$

A partir de la formule (2):

$$10 \log \Delta T_e = P'_s + G'_3(\eta_e) + G_4(\theta_r) + 228{,}6 - L_d$$
$$= -57 + 15{,}5 + 14{,}5 + 228{,}6 - 196 = 5{,}6 \text{ dBK}$$

on obtient,

$$\Delta T_e = 3{,}6 \text{ K}$$

La formule (3) donne:

$$\Delta T = \gamma \Delta T_s + \Delta T_e$$
$$= 0{,}032 \times 145 + 3{,}6 = 8{,}2 \text{ K}$$

d'où:

$$\frac{\Delta T}{T} \times 100 = \frac{8{,}2 \times 100}{105} = 7{,}8\ \%$$

4. *Conclusion:*

Dans l'exemple ci-dessus, le pourcentage d'argumentation de la température de bruit équivalent de la liaison par satellite est 7,8 %. Etant donné que cette valeur dépasse la valeur de seuil de 4 %, une coordination des deux réseaux est nécessaire.

(MOD) **AP29A** APPENDICE 30

Dispositions applicables à tous les services et Plan associé concernant le service de radiodiffusion par satellite dans les bandes de fréquences 11,7-12,2 GHz (dans les Régions 2 et 3) et 11,7-12,5 GHz (dans la Région 1) (1)

(Voir l'article 15)

ARTICLE 1

Définitions générales

Aux fins du présent appendice, les termes ci-dessous sont définis comme suit:

Conférence. — Conférence administrative mondiale des radiocommunications chargée d'établir un plan pour le service de radiodiffusion par satellite dans les bandes de fréquences 11,7-12,2 GHz (dans les Régions 2 et 3) et 11,7-12,5 GHz (dans la Région 1), dénommée en abrégé Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

Plan. — Le Plan pour les Régions 1 et 3 ses annexes.

Assignation de fréquence conforme au plan. — Assignation de fréquence figurant dans le Plan ou pour laquelle la procédure de l'article 4 du présent appendice a été appliquée avec succés.

ARTICLE 2

Bandes de fréquences

2.1. Les dispositions du présent appendice s'appliquent au service de radiodiffusion par satellite dans les bandes de fréquences comprises entre 11,7 GHz et 12,5 GHz dans la Région 1, et entre 11,7 GHz et 12,2 GHz dans les Régions 2 et 3 aux autres services auxquels ces bandes sont attribuées, en ce qui concerne les relations de ces services avec le service de radiodiffusion par satellite dans ces bandes.

ARTICLE 3

Exécution des dispositions et du plan associé

3.1. Les Membres de l'Union faisant partie des Régions 1 et 3 adoptent, pour leurs stations spatiales de radiodiffusion fonctionnant dans les bandes de fréquences faisant l'objet du présent appendice, les caractéristiques spécifiées dans le Plan de ces Régions.

3.2. Les Membres de l'Union faisant partie de la Région 2 appliquent les dispositions transitoires contenues das l'article 12 du présent appendice. Ces dispositions régissent le service de radiodifusion par satellite dans la Région 2, jusqu'à l'entrée en vigueur des plans détaillés de la Région 2, qui seront établis par une future conférence administritive régionale des radiocommunications.

3.3. Les Membres de l'Union ne pourront modifier les caractéristiques spécifiées dans le Plan ou mettre en service de nouvellese stations spatiales de radiodiffusion par satellite des autres services auxquels ces bandes de fréquences sont attribuées que dans les conditions indiquées dans le Règlement des radiocommunications et aux articles et annexes pertinents du présent appendice.

ARTICLE 4

Prócedure relative aux modifications apportées au Plan

4.1. Lorsqu'une administration se propose d'apporter une modification (2) au plan, c'est-à-dire:

Soit de modifier les caractéristiques de l'une de ses assignations de fréquence à une station spatiale (3) du service de radiodiffusion par satellite figurant dans le Plan ou pour laquelle la procédure définie dans le présent article a été appliquée avec succès, que cette soit en service ou non;

Soit d'inscrire dans le Plan une nouvelle assignation de fréquence à une station spatiale du service de radiodiffusion par satellite;

Soit d'annuler une assignation de fréquence à une station spatiale du service de radiodiffusion par satellite.

---

(1) Les dispositions et le Plan associé du présent appendice sont entrés en vigeur le 1er janvier 1979 en application de l'article 15 des Actes Finals de la Conférence Administrative Mondiale des Radiocommunications pour la Rediodiffusion par Satellite (Génève, 1977)

(2) L'utilisation d'une valeur de la dispersion de l'énergie différent de celle au paragraphe 3.18 de l'annexe 8 est considerée comme une modification; en conséquence, les dispositions pertinentes du présent article lui sont applicables.

(3) L'expression «assignation de fréquence à une station spatiale», partout ou elle figure dans le présent article, doit être entendue comme se réfèrant à une assignation de fréquence associée à une position sur l'orbite donnée. Voir en annexe 10 les restrictions applicables aux positions sur l'orbite.

La procédure suivante est appliquée avant toute notification pertinente au Comité International d'Enregistrement des Fréquences (voir l'article 5 du présent appendice).

4.2. L'expression «assignation de fréquence conforme au Plan», utilisée dans cet article et les suivants, est définie dans l'article 1.

4.3. *Project de modification d'une assignation de fréquence conforme au Plan ou projet d'inscription d'une nouvelle assignation de fréquence dans le Plan.*

4.3.1. Toute administration qui envisage la modification des caractéristiques d'une assignation de fréquence conforme au Plan ou l'inscription d'une nouvelle assignation de fréquence dans le Plan l'accord de toute autre administration:

4.3.1.1. Dont une assignation de fréquence à une station spatiale du service de radiodiffusion par satellite, conforme ao Plan, est inscrite dans le même canal ou dans un canal adjacent, ou pour laquelle des modifications au Plan ont été publiées, par le Comité conformément aux dispositions du présent article.

4.3.1.2. Dont une assignation de fréquence à une station spatiale du service de radiodiffusion par satellite dans la Région 2 a une largeur de bande nécessaire recouvrant partiellement celle de l'assignation envisagée, et est inscrite dans le Fichier de référence, ou:

Fait ou fait l'objet de la coordination selon les dispositions de la Résolution **33** (1), ou

Figure dans un plan pour la Région 2 (2) qui sera adopté lors d'une future conférence administrative régionale des radiocommunications, compte tenu des modifications qui pourraient être apportées à ce plan conformément aux actes finals de ladite conférence.

4.3.1.3. N'ayant aucune assignation de fréquence du service de radiodiffusion par satellite dans le canal considéré, mais sur le territoire duquel la puissance surfacique dépasse la limite prescrite du fait de ce projet de modification.

4.3.1.4 Dont une assignation de fréquence à une station spatiale du service fixe par satellite est inscrite dans le Fichier de référence dans la bande 11,7-12,2 GHz ou fait, ou a fait, l'objet d'une coordination aux termes du numéro **1060** du Règlement des radiocommunications ou du paragraphe 7.2.1 du présent appendice et qui est considérée comme défavorablement influencée.

Une assignation de fréquence est considérée comme défavorablement influencée lorsque les limites indiquées dans l'annexe 1 sont dépassées.

4.3.2. Toute administration qui envisage d'apporter une modification au Plan doit envoyer au Comité, au plus tôt cinq ans, mais au plus tard dix-huits mois, avant la date à laquelle l'assignation doit être mise en service, les renseignements pertinents énumérés dans l'annexe 2. Si l'assignation n'est pas mise en service au plus tard à cette date, la modification est considérée comme nulle.

4.3.2.1. Si projet de modification n'entraîne pas un dépassement des limites spécifiées dans l'annexe 1, il y a lieu de le préciser lors de l'envoi au Comité des renseignements demandés au paragraphe 4.3.2. Le Comité publiera ces renseignements dans une section spéciale de sa circulaire hebdomadaire.

4.3.2.2. Dans les autres cas, afins de parvenir à l'accord prévu au paragraphe 4.3.1, l'administration communicque au Comité le nom des administrations auprès desquelles elle estime qu'un accord doit être recherché ainsi que le nom des administrations avec lesquelles un accord a déjà été conclu.

4.3.3. Le Comité détermine, d'après l'annexe 1, les adminstrations dont les assignations de fréquence sont considérées comme étant défavorablement influencées au sens du paragraphe 4.3.1. Le Comité inclut le nom de ces administrations dans les renseignements reçus en application du paragraphe 4.3.2.2 et publie l'ensemble des renseignements dans une section spéciale de sa circulaire hebdomadaire. Le Comité communique immédiatement les résultats de ses calculs à l'administration qui envisage d'apporter la modification au Plan.

4.3.4. Le Comité adresse un télégramme aux administrations énumérées dans la section spéciale de sa circulaire hebdomadaire en attirant leur attention sur la publication de ces renseignements et leur communique le résultat de ses calculs.

4.3.5. Toute administration qui considère qu'elle aurait dú figurer dans la liste des administrations dont les services sont considérés comme étant défavorablement influencés peut demander au Comité de l'inclure dans cette liste: elle fournit au Comité les raisons techniques à l'appui de sa demande. Le Comité étudie cette demande sur la base de l'annexe 1 et envoie une copie de ladite demande, accompagnée d'une recommandation appropriée, à l'administration qui envisage la modification au Plan.

4.3.6. Toute modification d'une assignation de fréquence conforme au Plan, ou toute inscription dans le Plan d'une nouvelle assignation de fréquence qui entrainerait le dépassement des limites spécifées dans l'annexe 1, est subordonnée à l'accord de toutes les administrations défavorablement influencées.

4.3.7. L'administration qui recherche un accord ou l'administration auprès de laquelle un accord est recherché peut demander les renseignements techniques supplémentaires qu'elle estime nécessaires. Les administrations portent ces demandes à la connaissance du Comité.

4.3.8. Les observations des administrations concernant les renseignements publiés em vertu du paragraphe 4.3.3 sont adressées à l'administration qui envisage la modification, soit directement, soit par l'intermédiaire du Comité. Dans touts les cas, le Comité doit être informé que des observations ont été formulées.

---

(1) Remplace la Résolution Spa2-3 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

(2) Le plan pour la Région 2, qui será adopté lors d'une future conférence administrative régionale des radiocommunications, ne devra pas abaisser le degré de protection aux assignations figurant dans le Plan, au-dessous des limites spécifiées dans le présent appendice.

4.3.9. Toute administrations n'ayant pas adressé ses observations à l'administration notificatrice, soit directement, soit par l'intermédiaire du Comité, dans un délai de cent vingt jours après da date de circulaire hebdomadaire mentionnée au paragraphe 4.3.2.1 ou 4.3.3 est réputée avoir donné son accord à la modification envisagée. Ce délai peut être prorogé de quatre-vingts jours pour une administration qui a demandé des renseignements supplémentaires conformément aux dispositions du paragraphe 4.3.7 ou l'aide du Comité conformément au paragraphe 4.3.17. Dans ce dernier cas, le Comité porte cette demande à la connaissance des administrations intéressées.

4.3.10. Lorsque, pour parvenir à un accord, une administration est conduite à modifier son projet initial, des applique à nouveau les dispositions du paragraphe 4.3.2. et la procédure qui en découle vis-à-vis de toute administration dont les services pourraient être défavorablement influencés à la suite des modifications apportées au projet initial.

4.3.11. Si aucune observation ne lui est parvenue dans les délais spécifiés au paragraphe 4.3.9, ou si un accord est intervenu avec les administrations ayant formulé des observations et dont l'accord est nécessaire, l'administration qui envisage la modification peut continuer à appliquer la procédure appropriée de l'article 5; elle en informe le Comité en lui indiquant les caractéristiques définitives de l'assignation de fréquence ainsi que le nom des administrations avec lesquelles un accord a été conclu.

4.3.12. L'accord des administrations concernées peut également être obtenu, aux termes du présent article, pour une période déterminée.

4.3.13. Lorsqu'un project de modification au Plan intéressee des pays en voie de développement, les administrations recherchent toute solution pratique permettant d'assurer le développement économique du système de radiodiffusion par satellite desdits pays.

4.3.14. Le Comité publie dans une section spéciale de sa circulaire hebdomadaire les renseignements qu'il reçoit aux termes du paragraphes 4.3.11, en les accompagnant, le cas échéant, du nom des administrations avec lesquelles les dispositions du présent article ont été appliquées avec succés. L'assignation de fréquence bénéficiera du même statut que celles figurant dans le plan et sera considérée comme une assignation de fréquence conform au Plan.

4.3.15. Lorsqu'une administration qui envisage de modifier les caractéristiques d'une assignation de fréquence ou de mettre en service une nouvelle assignation de fréquence reçoit un avis de désaccord d'une autre administration dont elle a demandé l'accord, elle doit s'efforcer tout d'abord de résoudre le problème en recherchant tout les moyens possibles pour satisfaire à ses besoins. Si le problème ne peut pas encore être résolu par le mise en œuvre de ces moyens, l'administration dont l'accord a été recherché doit s'efforcer de surmonter les difficultés dans toute la mesure du possible et donne les raisons techniques du désaccord si l'administration qui recherche l'accord lui demande de la faire.

4.3.16. Si aucun accord n'intervient entre les administrations intéressées, le Comité procéde à toute étude que peuvent lui demander ces administrations; il les informe du résultat de cette étude et leur présente les recommandations qu'il peut formuler en vue de résoudre le problème.

4.3.17. Toute administration peut, à n'importer quel stade de la procédure décrite ou avant d'appliquer cette procédure, demander l'aide du Comité, notamment dans la recherche de l'accord d'une autre administration.

4.3.18. Les dispositions pertinents de l'article 5 du présent appendice sont appliquées lors de la notification des assignations de fréquence au Comité.

4.4. *Annulation d'une assignation de fréquence.*

Lorsqu'une assignation de fréquence conforme au Plan est définitivement abandonnée, qu'il s'agisse ou non des conséquences d'une modification, l'administration intéressée en informe immédiatement le Comité. Celui-ci publie ce renseignement dans une section spéciale de sa circulaire hebdomadaire.

4.5. *Exemplaire de référence du Plan.*

4.5.1. Le Comité tient à jour un exemplaire de référence du plan en tenant compte de l'application de la procédure décrite dans le présent article. Le Comité préparera un document indiquant les amendements à apporter au Plan à la suite des modifications effectuées conformément à la procédure du présent article.

4.5.2. Le Secrétaire général est informé par le Comité de toute modification apportée au Plan; il publie sous une forme appropriée une version à jour du Plan lorsque les circonstances le justifient.

ARTICLE 5

Notification, examen et inscription dans le Fichier de référence des assignations de fréquence aux stations spatiales du service de radiodiffusion par satellite dans les Régions 1 et 3

5.1. *Notification.*

5.1.1. Toute administration qui se propose de mettre en service une assignation de fréquence à une station spatiale du service de radiodiffusion par satellite doit notifier cette assignation de fréquence au Comité. L'administration notificatrice applique à cet effet les dispositions suivantes.

5.1.2. Toute assignation de fréquence notifiée en exécution du paragraphe 5.1.1 doit faire l'objet d'une fiche individuelle de notification établie dans la forme prescrite à l'annexe 2 dont les diverses sections spécifient les caractéristiques fondamentales à fournir selon le cas. Il est recommandé que l'administration notificatrice communique également au Comité tout autre renseignements qu'elle peut juger utile.

5.1.3. La fiche de notification doit parvenir au Comité au plus tôt ans avant la date de mise en service de l'assignation de fréquence intéressée. Elle doit lui parvenir en tout cas au plus tard quatre-vingt-dix jours avant cette date (1).

5.1.4. Toute assignation de fréquence dont la notification parvient au Comité après l'expiration des délais prescrits au paragraphe 5.1.3 porte, lorsqu'il y a lieu de l'inscrire dans le Fichier de référence, une observation indiquant que la fiche de notification n'est pas conforme aux dispositions du paragraphe 5.1.3.

5.1.5. Lorsque le Comité reçoit une fiche de notification, établie en exécution du paragraphe 5.1.1,. qui ne contient pas les caractéristiques fondamentales spécifiées dans l'annexe 2, il la retourne immédiatement par poste aérienne à l'administration dont elle émane, accompagnée des motifs de ce renvoi.

5.1.6. Lorsque le Comité reçoit une fiche de notification complète, il inclut les renseignements qu'elle contient, avec sa date de réception, dans sa circulaire hebdomadaire; cette circulaire les renseignements figurant dans toutes les fiche de notification complétes reçues par le Comité depuis la publication de la circulaire précédente.

5.1.7. La circulaire tient lieu d'accusé de réception par le Comité, à l'administration notificatrice d'une fiche de notification complète.

5.1.8. Le Comité examine les fiches de notifications complètes dans l'ordre où il les reçoit. Il ne peut ajourner la conclusion, à moins qu'il ne manque de renseignements suffisants pour prendre une décision à cet égard; de plus, le Comité ne statue pas sur une fiche de notification ayant des relations techniques avec une fiche reçue antérieurement, et encore en cours d'examen, avant d'avoir pris une décision en ce qui concerne cette dernière.

5.2. *Examen et inscription.*

5.2.1. Le Comité examine chaque fiche de notification:

a) Du point de vue de sa conformité avec les clauses de la Convention, des dispositions pertinentes du Règlement des radiocommunications et de l'annexe 1 au présent appendice (à l'exception de celles qui ont trait à la conformité avec le Plan);

b) Du point de vue de sa conformité avec le Plan.

5.2.2. Lorsque le Comité formule une conclusion favorable relativement au paragraphe 5.2.1, l'assignation de fréquence notifiée par l'administration est inscrite dans le Fichier de référence; la date de réception par le Comité de la fiche de notification est inscrite dans la colonne 2d. En ce qui concerne les relations entre les administrations, toutes les assignations de fréquence mises en service conformément au Plan et inscrites dans le Fichier de référence seront considérés comme bénéficiant du même statut, quelle que soit la date inscrite dans la colonne 2d en regard de chacune d'elles.

5.2.3. Chaque fois le Comité inscrit une assignation de fréquence dans le Fichier de référence, il indique sa conclusion au moyen d'un symbole placé dans la colonne 13a.

5.2.4. Lorsque le Comité formule une conclusion défavorable relativement au paragraphe 5.2.1, la fiche de notification est retournée immédiatement par poste à l'administration notificatrice avec um exposé des raisons qui motivent la conclusion et avec les suggestions qu'il peut faire en vue de parvenir à une solution satisfaisante du problème.

5.2.5. Lorsque l'administration notificatrice présente à nouveau sa fiche de notification et si la conclusion du Comité devient favorable relativement au paragraphe 5.2.1, la fiche est traitée comme il est indiqué au paragraphe 5.2.2.

5.2.6. Si l'administration présente à nouveau sa fiche non modifiée en insistant pour un nouvel examen de cette fiche, mais si la conclusion du Comité relativement ao paragraphe 5.2.1 reste défavorable, la fiche de notification est retournée à l'administration notificatrice conformément au paragraphe 5.2.4. Dans ce cas, l'administration notificatrie s'engage à ne pas mettre en service l'assignation de fréquence tant que la condition spécifiée au paragraphe 5.2.5 n'a pas été remplie. L'accord des administrations concernées peut également être obtenu, aux termes de l'article 4, pour une période déterminée. Dans ce cas, l'accord est notifié au Comité et l'assignation de fréquence est inscrite dans le Ficher de référence avec une note précisant qu'elle n'est valable que pour la période spécifiée. L'administration notificatrice qui utilise l'assignation de fréquence pendant la durée ainsi déterminée ne doit pas prendre ultérieurement prétexte de cette utilisation pour maintenir l'assignation en service à l'issue de cette période si elle n'obtient pas l'autorisation de la ou des administrations intéressées.

5.2.7. Si l'assignation de fréquence notifiée avant sa mise en service conformément aux dispositions du paragraphe 5.1.3 est l'objet d'une conclusion favorable du Comité relativement aux dispositions du paragraphe 5.2.1, elle est inscrite provisoirement dans le Fichier de référence avec, dans la colonne Observations, un symbole spécial indiquant le caractère provisoire de cette inscription.

5.2.8. Lorque le Comité a reçu la confirmation de la mise en service de l'assignation de fréquence, il supprime le symbole dans le Fichier de référence.

5.2.9. La date à inscrire dans la colopnne 2c est la date de mise en service notifiée par l'administration intéressée. Elle es donnée à titre d'information seulement.

5.3. *Annulation des inscriptions du Fichier de référence.*

5.3.1. Si une administration n'a pas conformé la mise en service d'une assignation de fréquence comme prévu au paragraphe 5.2.8, le Comité effectue une enquête auprès de cette administration au plus tôt six mois après l'expiration du délai indiqué au paragraphe 5.1.3. Lorqu'il reçoit les renseignements pertinents, le Comité modifie la date de mise en service ou annule l'inscription.

5.3.2. Si l'utilisation d'une assignation de fréquence inscrite au Fichier de référence vient à être abandonée dèfinitivement, l'administration notificatrice doit en informer le Comité dans um délai de quatre-vingt-dix jours, à la suite de quoi l'inscription au Fichier de référence est annulée.

---

(1) L'administration notificatrice engage, le cas échéant, la procédure relative aux modifications apportées au Plan en temps voulu pour que cette date limite soit respectée.

ARTICLE 6

Coordination, notification et inscription dans le Fichier de référence international des fréquences d'assignations de fréquence à des stations de Terre affectant des assignations de fréquence à des stations de radiodiffusion par satellite dans les bandes 11,7-12,2 GHz (dans les Régions 2 et 3) et 11,7-12,5 GHz (dans la Région 1) (1) (2).

SECTION I

Procédure de coordination à appliquer

6.1.1. Avant de notifier au Comité une assignation de fréquence à une station d'émission de Terre, une administration doit engager une coordination avec toute autre administration ayant une asssignation de fréquence à une station de radiodiffusion par satellite conforme au Plan si:

Les largeurs de bande nécessaires des deux émissions se chevauchent; et
Si la puissance surfacique que produirait la station d'émission de Terre en projet dépassait la valeur calculée conformément à l'annexe 3 en un ou plusieurs points situés à la limite de la zone de service comprise dans la zone de couverture de la station de radiodiffusion par satellite.

6.1.2. En vue de cette coordination, l'administration dont dépend la station de Terre envoie aux administrations intéressées, par les voies les plus rapides, en graphique à échelle convenable indiquant l'emplacement de la station de Terre et elle lui communique toutes les autres données concernant l'assignation de fréquence en projet, ainsi que la date approximative prévue pour la mise en service de la station.

6.1.3. Toute administration auprès de laquelle la coordination est recherchée accuse immédiatement réception, par télégramme, des données concernant la coordination. Si l'administration qui recherche la coordination ne reçoit pas d'accusé de réception dans le délai de quinze jours qui suite l'envoi des données concernant la coordination, elle peut envoyer um télégramme demandant cet accusé de réception, télégramme auquel l'administration qui le reçoit doit répondre. Au reçu des données concernant la coordination, l'administration auprès de laquelle la coordination est recherchée étudie rapidement la question du point de vue des brouillages (3) qui seraient causés à ses assignations de fréquence conformes au Plan. Puis, dans un délai global de soixante jours à partir de l'envoi des données concernant la coordination, cette administration, ou bien communique à l'administration qui recherche la coordination son accord sur l'assignation en projet, ou bien, en cas d'impossibilité, lui indique les motifs de son désaccord et lui présent les suggestions qu'elle peut faire, le cas échéant, en vue d'arriver à une solution satisfaisante du problème.

6.1.4. Aucune coordination n'est requise lorsqu'une administration se propose de modifier les caractéristiques d'une assignation existante de telle sorte que le niveau des brouillages causés aux services devant être assurée par les stations du service de radiodiffusion par satellite d'autres administrations, dont les assignations sont conformes au Plan, ne s'en trouve pas accru.

6.1.5. L'administration qui recherche la coordenation peut demander au Comité de s'efforcer d'effectuer cette coordination dans les circonstances suivantes:

a) Une administration auprès de laquelle la coordination est recherchée n'envoie pas d'accusé de réception, aux termes du paragraphe 6.1.3, dans um délai de trente jours à partir de la date de l'envoi des données concernant la coordination;
b) Une administration qui a envoié un accusé de réception conformément aux dispositions du paragraphe 6.1.3 ne communique pas sa décision dans un délai de quatre-vingt-dix jours à partir de l'envoi des données concernant la coordination;
c) L'administration qui recherche la coordination et une administration auprès de laquelle la coordination est recherchée sont en désaccord en ce qui concerne le niveau de brouillage acceptable;
d) Ou encore la coordination n'est pas possible pour toute autre raison.

En présentant sa demande au Comité, l'administration intéressée lui communique les renseignements nécessaires pour lui permettre de s'efforcer d'effectuer la coordination.

6.1.6. L'administration qui recherche la coordination, ou toute administration auprès de laquelle la coordination est recherchée, ou bien le Comité, peuvent demander les renseignements supplémentaires dont ils estiment avoir besoin pour évaluer le niveau des brouillages causés aux services intéressés.

6.1.7. Lorsque le Comité reçoit une demande aux termes de l'alinéa *a*) du paragraphe 6.1.5, il envoie sans délai un télégramme à l'administration intéressée en lui demandant d'en accuser réception immédiatement.

---

(1) Ces procédures ne dispensent pas de l'application des procédures prescrites pour les stations de Terre dans l'article 12 du Règlement des radiocommunications, lorsque des stations autres que celles du service de radiodiffusion par satellite sont impliquées.

(2) Les précedures de coordination, de notification et d'inscription des assignations aux stations de Terre affectant des stations de radiodifusion par satellite dans la Région 2 sont stipulées à l'article 12 du Règlement des radiocommunications, sauf que la nécessité de la coordination mentionnée aux numéros **1148** à **1154** du Règlement des radiocommunications est déterminée d'après les régles de l'annexe 3.

(3) Les critères à utiliser pour évaluer les niveaux de brouillage sont fondés sur les Avis pertinents du CCIR ou, en l'absence de tels Avis, font l'objet d'un accord entre les administrations intéressées.

6.1.8. Lorsque le Comité reçoit um accusé de réception à la suite de la mesure qu'il a prise aux termes du paragraphe 6.1.7. ou lorsque le Comité reçoit une demande aux termes de l'alinéa *b*) du paragraphe 6.1.5, il envoie sans délai um télégramme à l'administration intéressée en lui demandant de prendre rapidement une décision sur la question.

6.1.9. Lorsque le Comité reçoit une demande aux termes de l'alinéa *d*) du paragraphe 6.1.5 il s'efforce d'effectuer la coordination conformément aux dispositions du paragraphe 6.1.2. Lorsque le Comité ne reçoit pas d'accusé de réception à sa demande de coordination dans le délai spécifié au paragraphe 6.1.3, il agit conformément aux dispositions du paragraphe 6.1.7.

6.1.10. Lorsqu'une administration ne répond pas dans le délai de trente jours qui suit l'envoi du télégramme que le Comité lui a envoyé aux termes du paragraphe 6.1.7 en lui demandant un accusé de réception, ou lorsqu'une administration ne communique pas sa décision sur la question dans le délai de soixante jours qui suit l'envoi du télégramme du Comité aux termes du paragraphe 6.1.8, l'administration auprès de laquelle la coordination est recherchée est réputée s'être engagés à ne pas formuler de plainte concernant les brouillages préjudiciables qui pourraient être causés part la station de Terre en voie de coordination au service assuré ou devant être assuré par sa station de radiodiffusion par satellite.

6.1.11. S'il y a lieu, le Comité évalue, au titre de la procédure spécifiée au paragraphe 6.1.5, le niveau de brouillage. En tout état de cause, il communique aux administrations intéressées les résultats obtenus.

6.1.12. En cas de désaccord persistant entre l'administration qui recherche la coordination et une administration auprès de laquelle la coordination est recherchée, les administrations intéressées peuvent envisager la possibilité de conclure un accord sur l'utilisation, pendant une période donnée de l'assignation de fréquence proposée.

SECTION II

Procédure de notification des assignations de fréquence

6.2.1. Toute assignation de fréquence à une station fixe, terrestre ou de radiodiffusion doit être notifiée au Comité international d'enregistrement des fréquences si l'utilisation de la fréquence en question est susceptible d'entraîner des brouillages préjudiciables au service assuré ou devant être assuré par une station de radiodiffusion par satellite de toute autre administration, ou si l'on désire obtenir une reconnaissance internationale de l'utiliusation de cette fréquence (1).

6.2.2. Cette assignation de fréquence doit faire l'objet d'une fiche individuelle de notification établie dans la forme prescrite à l'appendice 1 au Règlement des radiocommunications dont la section A spécifie les caractéristiques fondamentales à fournir selon le cas. Il est recommandé que l'administration notificatrice communique également au Comité les autres renseignements indiqués dans cet appendice, ainsi que tout autre renseignement qu'elle peut juger utile.

6.2.3. Chaque fiche de notification doit, autante que faire se peut, parvenir au Comité avant la date de mise en service de l'assignation de fréquence intéressée. Toute fiche établie conformément aux dispositions du paragraphe 6.2.2 doit parvenir au Comité au plus tôt trois ans et au plus tard quatre-vingt-dix jours avant la date de mise en service de l'assignation de fréquence intéressée.

6.2.4. Toute assignation de fréquence dont la notification parvient au Comité moins de quatre-vingt-dix jours avant la date notifiée de mise en service, porte, lorsqu'il y a lieu de l'inscrire dans le Fichier de référence, une observation indiquant que la fiche de notification n'est pas conforme aux dispositions du paragraphe 6.2.3.

SECTION III

Procédure pour l'examen des fiches de notification et l'inscription des assignations de fréquence dans le Fichier de référence

6.3.1. Quel que soit le moyen de communication, y compris le télégraphe, par lequel une fiche de notification est transmise au Comité, elle est considérée comme complète lorsqu'elle contient au moins les caractéristiques fondamentales appropriées, telles qu'elles sont spécifiées à la section A de l'appendice 1 au Règlement des radiocommunications.

6.3.2. Le Comité examine les fiches de notification complètes dans l'ordre où il les reçoit.

6.3.3. Lorque le Comité reçoit une fiche de notification incomplète, il la retourne immédiatement par poste aérienne à l'administration dont elle émane, en indiquant les motifs de ce renvoi.

6.3.4. Lorsque le Comité reçoit une fiche de notification complète, il inclut les renseignements qu'elle contient, avec sa date de réception, dans sa circulaire hebdomadaire; cette circulaire contient les renseignements figurant dans toutes les fiches de notification complètes reçues par le Comité depuis la publication de la circulaire précédente.

6.3.5. La circulaire tient lieu d'accusé de réception par le Comité, à l'administration notificatrice, d'une fiche de notification complète.

6.3.6. Chaque fiche de notification complète est examinée par le Comité dans l'ordre spécifié au paragraphe 6.3.2. Le Comité ne peut pas ajourner la conclusion, à moins qu'il ne manque de renseignements suffisants pour prendre une

---

(1) L'attention des administrations est spécialement attirée sur l'application des dispositions de la section 1 du présent article.

décision à cet égard; de plus, le Comité ne statue pas sur une fiche de notification ayant des relations techniques avec une fiche reçue antérieurement et encore en cours d'examen avant d'avoir pris une décision en ce qui concerne cette dernière.

6.3.7. Le Comité examine chaque fiche de notification:

6.3.8. *a*) Du point de vue de sa conformité avec les clauses de la Convention, les clauses pertinentes du Règlement des radiocommunications et les clauses du present appendice (à l'exception de celles qui sont relatives à la procédure de coordination et à la probabilité de brouillages préjudiciables).

6.3.9. *b*) Du point de vue de sa conformité avec les dispositions du paragraphe 6.1.1, lesquelles concernent la coordination de l'utilisation de l'assignation de fréquence avec les autres administrations intéressées.

6.3.10. *c*) Le cas échéant, du point de vue de la probabilité d'un brouillage préjudiciable au détriment d'une station dont l'assignation de fréquence est conforme au Plan.

6.3.11. Selon les conclusions auxquelles le Comité parvient à la suite de l'examen prévu aux paragraphes 6.3.8, 6.3.9 et 6.3.10, la procédure se poursuit comme suit.

6.3.12. *Conclusion défavorable relativement au parágraphe 6.3.8.*

6.3.13. Lorsque la fiche comporte une référence selon laquelle la station fonctionnera conformément aux dispositions du numéro **342** du Règlement des radiocommunications elle est examinée immédiatement du point de vue des paragraphes 6.3.9 et 6.3.10.

6.3.14. Si la conclusion est favorable relativement aux paragraphes 6.3.9 ou 6.3.10, selon le cas, l'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notification est inscrite dans la colonne 2d.

6.3.15. Si la conclusion est défavorable relativement aux paragraphes 6.3.9 ou 6.3.10. selon de cas, la fiche est retournée immédiatement par poste aérienne à l'administration notificatrice avec un exposé des raisons qui motivent la conclusion du Comité. Dans cer cas, l'administration notificatrice s'engage à ne pas utiliser l'assignation de fréquence jusqu'à ce que la condition définе au paragraphe 6.3.14 puisse être remplie. Mais les administrations intéressées peuvent envisager la possibilité de conclure un accord sur l'utilisation, pendant une période donnée, de l'assignation de fréquence proposée.

6.3.16. Lorsque la fiche ne comporte aucune référence selon laquelle la station fonctionnera conformément aux dispositions du numéro **342** du Règlement des radiocommunications, cette fiche est retournée immédiatement par poste aérienne à l'administration notificatrice avec un exposé des raisons qui motivent la conclusion du Comité et avec les suggestions qu'il peut faire, le cas échéant, pour arriver à une solution satisfaisant du problème.

6.3.17. Si l'administration notificatrice présente de nouveau sa fiche non modifiée, celle-ci est traitée selon les dispositions du paragraphe 6.3.16.

6.3.18. Si l'administration notificatrice présente de nouveau sa fiche avec une référence selon laquelle la station fonctionnera conformément aux dispositions du numéro **342** du Règlement des radiocommunications, la fiche de notification est traitée selon les dispositions des paragraphes 6.3.13 et 6.3.14 ou 6.3.15, selon le cas.

6.3.19. Si l'administration notificatrice présente de nouveau sa fiche avec des modifications telles que, après un nouvel examen, la conclusion du Comité devient favorable relativement au paragraphe 6.3.8, la fiche de notification est traitée selon les dispositions des paragraphes 6.3.20 à 6.3.32. S'yl y a lieu ultérieurement d'inscrire l'assignation dans le Fichier de référence, la date de réception par le Comité de la fiche de notification présentée de nouveau est inscrite dans la colonne 2d.

6.3.20. *Conclusion favorable relativement au paragraphe 6.3.8.*

6.3.21. Lorsque le Comité conclut que la procédure de coordination dont il est question au paragraphe 6.3.9 as été appliquée avec succés auprès de toutes les administrations dont les services de radiodiffusion par satellite peuvent être défavorablement influencés, l'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notification est inscrite dans la colonne 2d.

6.3.22. Lorsque le Comité conclut que la procédure de coordination dont il est question au paragraphe 6.3.9 n'a pas été appliquée et si l'administration notificatrice lui demande d'effectuer la coordination requise, le Comité prend les mesures nécessaires à cet effet et communique aux administrations intéressées les résultats obtenus. Si les tentatives du Comité en vue de mener à bien la coordination sont couronnées de succès, la fiche de notification est traitée conformément aux dispositions du paragraphe 6.3.21. Si les tentatives du Comité ne sont pas couronnées du succès, il examine la fiche de notification du point de vue du paragraphe 6.3.10.

6.3.23. Lorsque le Comité conclut que la procédure de coordination dont il est question au paragraphe 6.3.9 n'a pas été appliquée et si l'administration notificatrice lui demande pas d'effectuer la coordination requise, la fiche de notification est renvoyée immédiatement par poste aérienne à l'administration avec un exposé des raisons qui motivent ce renvoi et avec les suggestions que le Comité peut faire, le cas échéant, en vue d'arriver à une solution satisfaisante du problème.

6.3.24. Lorsque l'administration notificatrice présente de nouveau sa fiche de notification et le Comité conclut que la procédure de coordination dont il est question au paragraphe 6.3.9 a été appliquée avec succès auprès de toutes les administrations dont les services de radiodiffusion par satellite peuvent être défavorablement influencés, l'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notification initiale est inscrite dans la colonne 2d. La date de réception par le Comité de la fiche de notification présentée de nouveau est indiquée dans la colonne Observations.

6.3.25. Lorsque l'administration notificatrice présente de nouveau sa fiche de notification en demandant au Comité d'effectuer la coordination requise, la fiche de notification est traitée conformément aux dispositions du paragraphe

6.3.22. S'il y a lieu ultérieurement d'inscrire l'assignation dans le Fichier de référence, la date de réception par le Comité de la fiche de notification présentée de nouveau est indiquée dans la colonne Observations.

6.3.26. Lorsque l'administration notificatrice présente de nouveau sa fiche de notification en déclarant qu'elle n'a pas eu de succès en tentant d'effectuer la coordination, le Comité examine la fiche du point de vue des dispositions du paragraphe 6.3.10. S'il y a lieu ultérieurement d'inscrire l'assignation dans le Fichier de référence, la date de réception par le Comité de la fiche de notification présentée de nouveau est indiquée dans la colonne Observations.

6.3.27. *Conclusion favorable relativement aux paragraphes 6.3.8 et 6.3.10.*

6.3.28. L'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notification est inscrite dans la colonne 2d.

6.3.29. *Conclusion favorable au paragraphe 6.3.8, mais défavorable relativement au paragraphe 6.3.10.*

6.3.30. La fiche de notification est retournée immédiatement par poste aérienne à l'administration dont elle émane avec un exposé des raisons qui motivent la conclusion du Comité et avec les suggestions qu'il peut faire, le cas échéant, en vue d'arriver à une solution satisfaisant du problème.

6.3.31. Si l'administration notificatrice présente de nouveau sa fiche avec des modifications qui, après nouvel examen, entraînent de la part du Comité une conclusion favorable relativement au paragraphe 6.3.10, l'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de modification (initiale) est inscrite dans la colonne 2d. Las date de réception par le Comité de la fiche de notification présentée à nouveau est indiquée dans la colonne Observations.

6.3.32. Dans le cas où l'administration notificatrice présente de nouveau sa fiche de notification, soit non modifiée, soit avec des modifications dont l'effet est de diminuer la probabilité de brouillages préjudiciables mais dans des proportions insuffisantes pour permettre l'aplication des dispositions du paragraphe 6.3.31, et où cette administration insiste pour un nouvel examen de la fiche de notification, mais où les conclusions du Comité restent les mêmes, la fiche de notification est de nouveau retournée à l'administration notificatrice conformément au paragraphe 6.3.30. Dans ce cas, l'administration notificatrice s'engage à ne pas utiliser l'assignation de fréquence proposée jusqu'à ce que la condition définie au paragraphe 6.3.31 puisse être remplie. Mais les administrations intéressées peuvent envisager la possibilité de conclure un accord sur l'utilisation, pendant une période spécifiée, de l'assignation de fréquence proposée. Dans ce cas, le Comité est averti de l'accord et l'assignation de fréquence est inscrite dans le Fichier de référence, accompagnée d'une note indiquant que sa validité ne s'étende pas au-delà de la période spécifiée. L'administration notificatrice qui utilise l'assignation de fréquence pendant une durée spécifiée ne doit pas prendre ultérieurement prétexte de cette utilisation pour maintenir l'assignation en service à l'issue de cette période, si elle n'obtient pas l'autorisation de la ou des administrations intéressées.

6.3.33. *Modification aux caractéristiques fondamentales des assignations déjà inscrites dans le Fichier de référence.*

6.3.34. Toute notification de modification aux caractéristiques fondamentales d'une assignation déjà inscrite dans le Fichier de référence, telles qu'elles sont définies à l'appendice 1 au Règlement des radiocommunications (à l'exception toutefois de celles qui figurent dans les colonnes 3 et 4a du Fichier de référence), est examinée par le Comité selon les dispositions des paragraphes 6.3.8 et 6.3.9 et, le cas échéant, du paragraphe 6.3.10, et les dispositions des paragraphes 6.3.12 à 6.3.32 sont appliquées. Lorsqu'il y a lieu d'inscrire la modification dans le Fichier de référence, l'assignation initiale est modifiée selon la notification.

6.3.35. Cependant, dans le cas d'une modification aux caractéristiques fondamentales d'une assignation conforme aux dispositions du paragraphe 6.3.8 où le Comité formule une conclusion favorable relativement au paragraphe 6.3.9 et relativement au paragraphe 6.3.10, lorsque les dispositions de celui-ci sont applicables, ou conclut que cette modification n'accroit pas la probabilité de brouillages préjudiciables au détriment d'assignations de fréquence déjà inscrites dans le Fichier de référence, l'assignation de fréquence modifiée conserve la date initialement inscrite dans la colonne 2d. De plus, la date de réception par le Comité de la fiche de notification concernant la modification est indiquée dans la colonne Observations.

6.3.36. Dans l'application des dispositions de la présente section, toute fiche de notification présentée de nouveau au Comité et qui lui parvient plus de deux ans après la date à laquelle il a renvoyé la fiche à l'administration notificatrice est considérée comme une nouvelle fiche de notification.

6.3.37. *Inscription des assignations de fréquence notifiées avant leur mise en service.*

6.3.38. Si une assignation de fréquence notifiée avant sa mise en service fait l'objet d'une conclusion favorable formulée par le Comité relativement aux paragraphes 6.3.8 et 6.3.9 et, le cas échéant, 6.3.10, elle est inscrite provisoirement dans le Fichier de référence avec, dans la colonne Observation, un symbole spécial indiquant le caractère provisoire de cette inscription.

6.3.39. Si, dans un délai de trente jours après la date prévue pour la miuse en service, le Comité reçoit de l'administration notificatrice la confirmation de la date de mise en service, il supprime le symbole spécial inséré dans la colonne Observations. Au cas où, à la suite d'une demande reçue de l'administration notificatrice avant l'expiration de ce délai de trente jours, le Comité conclut que des circonstances exceptionnelles motivent um délai supplémentaire, celui-ci ne doit en aucun cas dépasser 150 jours.

6.3.40. Si l'utilisation, par une station de Terre, d'une assignation non conforme aux dispositions ci-dessus, cause un brouillage préjudiciable à la réception des émissions d'une station spatiale du service de radiodiffusion par satellite utilisant une assignation conforme au Plan, l'administration dont dépend la station de Terre doit, une fois avisée, prendre immédiatement des mesures pour éliminer ledit brouillage.

ARTICLE 7

Procédures préliminaires, notification et inscription dans le Fichier de référence international des fréquences des assignations de fréquence aux stations du service fixe par satellite dans la bande 11,7-12,2 GHz (dans la Région 2) lorsque des assignations de fréquence à des stations de radiodiffusion par satellite conformes au Plan sont impliquées (1).

SECTION I

Procédure pour la publication antecipée de renseignements concernant les systèmes du service fixe par satéllite en projet

7.1.1. Toute administration qui se propose d'établir un système du service fixe par satellite envoie au Comité international d'enregistrement des fréquences, avant d'engager, le cas échéant, la procédure décrite au paragraphe 7.2.1, et au plus tôt cinq ans avant la mise en service de chaque réseau à satellite du système en projet, les renseignements énumérés à l'appendice **4** au Règlement des radiocommunications.

7.1.2. Toute modification aux renseignements communiqués conformément aux dispositions du pasragraphe 7.1.1 au sujet d'un système à satellites en projet est également communiquée au Comité dès le moment où elle est disponible.

7.1.3. Le Comité publie les renseignements dont il est question aux paragraphes 7.1.1 et 7.1.2. dans une section spéciale de sa circulaire hebdomadaire et, lorsque la circulaire hebdomadaire contient des renseignements de cette nature, il en avise les administrations par télégramme-circulaire.

7.1.4. Si après avoir étudié les renseignements publiés aux termes du paragraphe 7.1.3, une administration quelle qu'elle soit est d'avis que des brouillages qui peuvent être inacceptables pourront être causés à ses assignations de fréquence conformes ao Plan, elle communique ses observations à l'administrations intéressée dans le délai de quatre-vingt-dix jours qui suit la date de la circulaire hebdomadaire dans laquelle les renseignements énumérés à l'appendice **4** au Règlement des radiocommunications ont été publiés. Elle envoie également au comité une copie de ces observations. Si l'administration intéressée ne reçoit d'une autre administration aucune observation de cette nature pendant la période susmentionnée, elle peut supposer que cette dernière n'a pas d'objection majeure à formuler à l'encontre du ou des réseaux en projet du système du service fixe par satellite à l'égard desquels des renseignements ont été publiés.

7.1.5. Une administration qui reçoit des observations formulées aux du paragraphe 7.1.4 s'efforce de résoudre les dificultés de toute nature qui peuvent se présenter sans prendre en considération la possibilité de remaniement des stations du service de radiodiffusion par satellite relevant d'autres administrations. Si elle ne peut pas trouver de tels moyens, l'administration intéressée peut alors s'adresser aux autres administrations concernées afin de résoudre ces dificcultés sous réserve que les modifications au Plan qui pourraient en résulter soient conformes à l'article 4.

7.1.6. Les administrations peuvent demander l'aide du Comité dans leurs tentatives pour résoudre les difficultés mentionées ci-dessus.

7.1.7. En se conformant aux dispositions des paragraphes 7.1.5 et 7.1.6, une administration responsable d'un système du service fixe par satellite en projet diffère, si c'est nécessaire, le début de la procédure de coordination définie au paragraphe 7.2.1 ou, si celle-ci n'est pas applicable, l'envoi de ses fiches de notification au Comité, jusqu'à une date postérieure de cent cinquante jours á la date de la circulaire hebdomadaire contenant les renseignements énumérés à l'appendice **4** au Règlement des radiocommunications et concernant le réseau à satellite pertinent. Cependant, vis-à-vis des administrations avec lesquelles les dificultés ont été résolues ou qui ont répondu favorablement, la procédure de coordination peut, le cas échéant, être engagée avant l'expiration du délai de cent cinquant jours précité.

7.1.8. Toute administration au nom de laquelle des renseignements sur les réseaux en projet de son système du service fixe par satellite ont été publiés conformément aux dispositions des paragraphes 7.1.1 à 7.1.3. fait périodiquement connaître au Comité si elle a reçu ou non des observations et elle lui communique l'état d'avancement du règlement, avec d'autres administrations, des dificultés éventuelles. Le Comité publie ces renseignements dans une station spéciale de sa circulaire hebdomadaire et, lorsque la circulaire hebdomadaire contient des renseignements de cette nature, il en avise les administrations par télégramme-circulaire.

SECTION II

Procédures de coordination à appliquer mdans certains cas

7.2.1. Avant de notifier au Comité ou de mettre en service une assignation de fréquence à une station spatiale du service fixe par satellite, une administration doit rechercher l'accord de toute autre administration ayant une assignation de fréquence conforme au Plan si:

Une portion qualconque de la largeur de bande nécessaire prévue pour la station spatiale du service fixe par satellite recouvre au moins partiellement la largeur de bande nécessaire associée à l'assignation de la station de radiodiffusion par satellite; et

La puissance surfacique qui serait produite par la station spatiale du service fixe par satellite dépasse la valeur spécifiée à l'annexe 4.

---

(1) Ces dispositions ne dispensent pas de l'application des procédures prescrites par les articles 11 et 13 du Règlement des radiocommunications lorsque des stations autres que celles du service de radiodiffusion par satellite qui ont des assignations conformes au Plan sont impliquées.

A cet effet, l'administration qui recherche la coordination envoie à toute autre administration visée ci-dessus les renseignements énumérés à l'appendice 3 au Règlement des radiocommunications.

7.2.2. Aucun accord supplémentaire n'est nécessaitre lorsqu'une administration se propose de modifier les caractéristiques d'une assignation existante de telle sorte que les conditions du paragraphe 7.2.1, ci-dessus n'entraînent pas la recherche d'un accord à l'égard du service de radiodiffusion par satellite d'une autre administration ou lorsque cette assignation a déjà fait l'objet d'un accord et que sa modification ne causera pas de brouillage éventuel dépassant les valeurs convenues lors de cet accord.

7.2.3. En même temps qu'une administration recherche la coordination, conformément au paragraphe 7.2.1, elle envoie au Comité une copie de la demande de coordination, accompagnée des renseignements énumérés à l'appendice 3 au Règlement des radiocommunications ainsi que du nom de la ou des administrations dont elle recherche l'accord. Le Comité détermine, en se fondant sur l'annexe 4, quelles sont les assignations de fréquence conformes au Plan qui sont considérées comme étant effectées. Le Comité ajoute le nom de ces administrations aux renseignements communiqués par l'administration qui recherche la coordination et publie ces renseignements dans une section spéciale de sa circulaire hebdomadaire, avec une référence à la circulaire hebdomadaire dans laquelle les renseignements concernant le système à satellites ont été publiés aux termes de la section I du présent article. Lorsque la circulaire hebdomadaire contient des renseignements de cette nature, le Comité en avise les administrations par télégramme-circulaire.

7.2.4. Toute administration qui estime qu'elle aurait dû être incluse dans la procédure dont il est question au paragraphe 7.2.1 a le droit de demander à être partie à cette procédure.

7.2.5. Toute administration dont l'accord est recherché aux termes du paragraphe 7.2.1 accuse immédiatement réception, par télégramme, des données concernant la coordination. Si l'administration qui recherche la coordination ne reçoit pas d'accusé de réception dans le délai de trente jours qui suit la date de la circulaire hebdomadaire dans laquelle les renseignements pertinents ont été publiés conformément aux dispositions du paragraphe 7.2.3, elle envoie um télégramme demandant cet accusé de réception, télégramme auquel l'administration qui le reçoit répond dans um nouveau dálai de trente jours. Au reçu des renseignements concernant la coordination, compte tenu de la date prévue de mise en service de l'assignation pour laquelle la coordination est recherchée, l'administration dont l'accord est recherché étudie rapidement la question, du point de vue des brouillages (1) qui seraient causés au service par celles de ses stations pour lesquelles un accord est recherché aux termes du paragraphe 7.2.1; puis, dans le délai de quatre-vingt-dix jours qui suit la date de la circulaire hebdomadaire pertinent, elle communique son accord à l'administration qui recherche la coordination. Dans le cas contraire, elle envoie dans le même délai à l'administration qui recherqhe la coordination de renseignements techniques indiquant les raisons qui motivent son désaccord et elle lui présente les suggestions qu'elle peut faire, le cas échéant, en vue d'arriver à une solution satisfaisante du problème. Une copie de ces observations est envoyée également au Comité.

7.2.6. L'administration qui recherche la coordination peut demander mau Comité de s'efforcer d'effectuer cette coordination dans les circonstances suivantes:

a) Une administration dont l'accord est recherché aux termes du paragraphe 7.2.1 n'envoie pas d'accusé de réception, aux termes du paragraphe 7.2.5, dans un délai de soixante jours à partir de la date de la circulaire hebdomadaire dans laquelle les renseignements relatifs à la demande de coordination ont été publiés;

b) Une administration a envoyé un accusé de réception aux termes du paragraphe 7.2.5, mais ne communique pas sa décision dans um délai de quatre-vingt-dix jours à partir de la date de la circulaire hebdomadaire pertinente;

c) L'administration qui recherche la coordination et l'administration dont l'accord est recherché ne sont pas du même avis en ce qui concerne le niveau de brouillage acceptable;

d) Ou encore la coordination n'est pas possible pour toute raison.

En présentant sa demande au Comité, l'administration intéressée lui communique les renseignements nécessaires pour lui permettre de s'efforcer d'effectuer la coordination.

7.2.7. L'administration qui recherche la coordination, ou toute administration dont l'accord est recherché, ou bien le Comité, peuvent demander les renseignements supplémentaires dont ils estiment avoir besoin pour évaluer le niveau des brouillages causés aux services intéressés.

7.2.8. Lorsque le Comité reçoit une demande aux termes de l'alinea *a*) du paragraphe 7.2.6, il envoie sans délai un télégramme à l'administration dont l'accord est recherché en lui demandant d'en accuser réception immédiatement.

7.2.9. Lorsque le Comité reçoit un accusé de réception à la suite de la mesure qu'il a prise aux termes du paragraphe 7.2.8 ou lorsque le Comité reçoit une demande aux termes de l'alinéa *b*) du paragraphe 7.2.6, il envoie sans délai um télégramme à l'administration dont l'accord est recherché en lui demandant de prendre rapidement une décision sur la question.

7.2.10. Lorsque le Comité reçoit une demande aux termes de l'alinéa *d*) du paragraphe 7.2.6, il s'efforce d'effectuer la coordination conformément aux dispositions du paragraphe 7.2.1. Le Comité prend également, le cas échéant, les mesures prévues au paragraphe 7.2.3. Lorsque le Comité ne reçoit pas d'accusé de réception à sa demande de coordination dans le délai spécifié au paragraphe 7.2.5, il agit conformément aux dispositions du paragraphe 7.2.8.

---

(1) Les critères à utiliser pour évaluer les niveaux de brouillage sont fondés sur les renseignements techniques contenus dans le présent appendice ou sur les Avis pertinents du CCIR et font l'objet d'un accord entre les administrations intéressées.

7.2.11. Lorsqu'une administration ne répond pas dans um délai de trente jours qui suit l'envoi du télégramme que le Comité lui a envoyé aux termes du paragraphe 7.2.8 en lui demandant un accusé de réception, ou lorsqu'elle ne communique pas sa décision sur la question dans le délai de trente jours qui suit l'envoi du télégramme du Comité aux termes du paragraphe 7.2.9, l'administration dont l'accord a été recherché est réputée s'être engagée:

a) À ne pas formuler de plainte concernant les brouillages préjudiciables qui pourraient être causés au service assuré par ses stations de radiodiffusion par satellite par l'utilisation de l'assignation de fréquence pour laquelle la coordination a été recherchée;

b) À faire en sorte que ses stations de radiodiffusion par satellite ne causeront pas de brouillages préjudiciables à l'utilisation de l'assignation de fréquence pour laquelle la coordination a été recherchée.

7.2.12. S'il y a lieu, le Comité évalue, dans le cadre de la procédure spécifiée au paragraphe 7.2.6, le niveau de brouillage. En tout état de cause, il communique aux administrations intéressées les résultats obtenus.

7.2.13. En cas de désaccord persistant entre l'administration qui recherche la coordination et l'administration dont l'accord a été recherché, l'administration qui recherche la coordination est en droit, cent cinquante jours après la date à laquelle elle a demandé la coordination, et compte tenu des dispositions du paragraphe 7.3.4, d'envoyer au Comité sa fiche de notification concernant l'assignation proposée, sous réserve que l'aide du Comité ait été demandée. Dans ces conditions, l'administration notificatrice s'engage à ne pas mettre en œuvre son assignation tant que la condition stipulée au paragraphe 7.4.11.2 ne peut être remplie. Cependant, les administrations intéressées peuvent étudier la possibilité de parvenir à un accord sur l'emploi de l'assignation proposée pendant une durée déterminée.

SECTION III

Notification des assignations de fréquence

7.3.1. Toute assignation de fréquence à une station spatiale du service fixe par satelite doit être notifiée au Comité:

a) Si l'utilisation de la fréquence en question est susceptible d'entraîner des brouillages préjudiciables à une assignation de fréquence conforme au Plan (1) appartenant à une autre administration;

b) Ou encore si l'on désire obtenir une reconnaissance internationale officielle de l'utilisation de cette fréquence.

7.3.2. Une notification analogue doit être faite dans le cas de toute fréquence destinée à être utilisée à la réception par une station terrienne, chaque fois que l'une au moins des circonstances spéficiées au paragraphe 7.3.1 se présente.

7.3.3. Toute assignation de fréquence notifiée en exécution des paragraphes 7.3.1 ou 7.3.2 doit faire l'objet d'une fiche individuelle de notification établie dans la forme pescrite à l'appendice **3** au Règlement des radiocommunications, dont les diverses sections spécifient les caractéristiques fondamentales à fournir selon le cas. L'administration notificatrice communique également tout autre renseignement qu'elle juge utile.

7.3.4. Chaque fiche de notification doit parvenir au Comité au plus tôt trois ans avant la date de mise en service de l'assignation de fréquence intéressée. Elle doit lui parvenir en tout cas au plus tard quatre-vingt-dix jours (2) avant cette date.

7.3.5. Toute assignation de fréquence à une station terrienne ou spatiale dont la notification parvient au Comité après l'expiration des délais voulus spécifiés au paragraphe 7.3.4 porte, lorsqu'il y a lieu de l'inscrire dans le Fichier de référence, una observation indiquant que la fiche de notification n'est pas conforme aux dispositions du paragraphe 7.3.4.

SECTION IV

Procédure pour l'examen des fiches de notification et l'inscription des assignations de fréquence dans le Fichier de référence

7.4.1. Lorsque le Comité reçoit une fiche de notification qui ne contient pas au moins les caractéristiques fondamentales spécifiées à l'appendice **3** au Règlement des radiocommunications, il la retourne immédiatement par poste aérienne à l'administration dont elle émane, accompagnée des motifs de ce renvoi.

7.4.2. Lorsque le Comité reçoit une fiche de notification complète, il inclut les renseignements que'elle contient, avec sa date de réception, dans sa circulaire hebdomadaire: cette circulaire contient les renseignements figurant dans toutes les fiches de notification complètes reçues par le Comité depuis la publication de la circulaire précédente.

7.4.3. La circulaire tient lieu d'accusé de réception par le Comité, à l'administration notificatrice, d'une fiche de notification complète.

7.4.4. Le Comité examine les fiches de notification complètes dans l'ordre où il les reçoit. Il ne peut pas ajourner la conclusion, à moins qu'il ne manque de renseignements suffisants pour prendre une décision à cet égard; de plus, le Comité ne statue pas sur une fiche de notification ayant des relations techniques avec une fiche reçue antérieurement et encore en cours d'examen, avant d'avoir pris une décision en ce qui concerne cette dernière.

---

(1) L'attention des administrations est spécialment attirée sur l'application du paragraphe 7.2.1 ci-dessus.

(2) L'administration notificatrice engage, le cas échéant, la ou les procédures de coordination en temps voulu pour que cette date limite soit respectée.

7.4.5. Le Comité examine chaque fiche de notification:

7.4.5.1. Du point de vue de sa conformité avec les clauses de la Convencion, les dispositions pertinentes du Règlement des radiocommunications et les dispositions du présent appendice (à l'exception de celles qui sont relatives aux procédures de coordination et à la probabilité de brouillages préjudiciables).

7.4.5.2. Le cas échéant, du point de vue de sa conformité avec les dispositions du paragraphe 7.2.1 lesquelles concernent la coordination de l'utilisation de l'assignation de fréquence avec les autres administrations intéressées ayant une assignation conforme au Plan.

7.4.5.3. Le cas échéant, du point de vue de la probabilité d'un brouillage préjudiciable au détriment du service assuré ou devant être assuré par une station de radiodiffusion par satellite dont l'assignation de fréquence est conforme au Plan.

7.4.6. Selon les conclusions auxquelles le Comité parvient à la suite de l'axamen prévu aux paragraphe 7.4.5.1, 7.4.5.2, et 7.4.5.3, selon le cas, la procédure se poursuit comme suit:

7.4.7. *Conclusion favorable relativement au paragraphe 7.4.5.1 dans les cas où les dispositions du paragraphe 7.4.5.2 ne sont pas applicables.*

7.4.7.1. L'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notafication est inscrite dans la colonne 2d.

7.4.8. *Conclusion défavorable relativement au paragraphe 7.4.5.1.*

7.4.8.1. Lorsque la fiche comporte une référence selon laquelle la station fonctionnera conformément aux dispositions du numéro **342** du Règlement des radiocommunications et que la conclusion est favorable relativement aux paragraphes 7.4.5.2 et 7.4.5.3, selon le cas, l'asignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notification est inscrite dans la colonne 2d.

7.4.8.2. Lorsque la fiche comporte une référence selon laquelle la station fonctinnera conformément aux dispositions du numéro **342** du Règlement des radiocommunications et que la conclusion est défavorable relativement aux paragraphes 7.4.5.2 et 7.4.5.3, selon le cas, la fiche est retournée immédiatement par poste aérienne à l'administration notificatrice avec un exposé des raisons qui motivent la conclusion du Comité. Dans ces conditions, l'administration notificatrice s'engage à ne pas utiliser l'assignation de fréquences jusqu'à ce que la condition spécifiée au paragraphe 7.4.8.1 puisse être remplie. L'accord des administrations intéressées peut également être obtenu pour une durée déterminée conformément à cet article. Dans ce cas, l'accord sera notifié au Comité et l'assignation de fréquence sera inscrite dans le Fichier de référence avec une note précisant qu'elle est valable pour la période spécifiée. L'administration notificatrice qui utilise l'assignation de fréquence pendant la durée spécifiée ne doit pas prendre ultérieurement prétexte de cette utilisation pour maintenir l'assignation en service à l'issue de cette période si elle n'obtient pas l'autorisation de la ou des administrations intéressées. La date de réception par le Comité de la fiche de notification initiale est inscrite dans la colonne 2d.

7.4.8.3. Lorsque la fiche ne comporte aucune référence selon laquelle la station fonctionnera conformément aux dispositions du numéro **342** du Règlement des radiocommunications, cette fiche est retournée immédiatement par poste aérienne à l'administration notificatrice avec un exposé des raisons qui motivent la conclusion du Comité et avec les suggestions qu'il peut faire, le cas échéant, pour arriver à une solution satisfaisante du problème.

7.4.8.4. Si l'administration notificatrice présente de nouveau sa fiche non modifiée, celle-ci est traitée selon les dispositions du paragraphe 7.4.8.3. Si l'administration notificatrice présente à nouveau sa fiche avec une réference selon laquelle la station fontionnera conformément aux dispositions du numéro **342** du Règlement des radiocommunications, la fiche de notification est traitée conformément aux dispositions du paragraphe 7.4.8.1 ou 7.4.8.2 selon le cas. Si la fiche est présentée à nouveau avec des modifications telles que, après un nouvel examen, la conclusion du Comité devient favorable relativement au paragraphe 7.4.5.1, la fiche est traitée comme une nouvelle fiche de notification.

7.4.9. *Conclusion favorable relativement au paragraphe 7.4.5.1 dans les cas où les dispositions du paragraphe 7.4.5.2 sont applicables.*

7.4.9.1. Lorsque le Comité conclut que les procédures de coordination dont il est question au paragraphe 7.4.5.2 ont été appliquées avec succès en ce qui concerne toutes les administrations dont les assignations de fréquence conformes au Plan peuvent être défavorablement influencées, l'assignation est inscrite dans le Fichier de réference. La date de réception par le Comité de la fiche de notification est inscrite dans la colonne 2d.

7.4.9.2. Lorsque le Comité conclut que la procédure de coordination dont il est question au paragraphe 7.4.5.2 n'a pas été appliquée et si l'administration notificatrice lui demande d'effectuer la coordination requise, le Comité prend les mesures nécessaires à cet effet et communique aux administrations intéressées les résultats obtenus. Si les tentatives du Comité en vue de mener à bien la coordination sont couronnées de succés, la fiche de notification est traitée conformément aux dispositions du paragraphe 7.4.9.1. Si les tentatives du Comité ne sont pas couronnées de succés, il examine la fiche de notification du point de vue des dispositions du paragraphe 7.4.5.3.

7.4.9.3. Lorsque le Comité conclut que la procédure de coordination dont il est question au paragraphe 7.4.5.2 n'a pas été appliquée et si l'administration notificatrice ne lui demande pas d'effectuer la coordination requise, la fiche de notification est renvoyée immédiatement par poste aérienne à l'administration notificatrice avec un expose des raisons qui motivent ce renvoi et les suggestions que le comité peut faire, le cas échéant, pour arriver a une solution satisfaisant du problème.

7.4.9.4. Lorsque l'administration notificatrice présente à nouveau sa fiche de notification et si le Comité conclut que la procédure de cordination dont il est question au paragraphe 7.4.5.2 a été appliquée avec succés en ce qui concerne toutes les administrations dont les assignations conformes au Plan peuvent être défavorablement influencées, l'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notification initiale est inscrite

dans la colonne 2d. La date de réception par le Comité de la fiche de notification présentée à nouveau est indiquée dans la colonne Observations.

7.4.9.5. Lorsque l'administration notificatrice présente à nouveau sa fiche de notification en demandant au Comité d'effectuer la coordination requise aux termes du paragraph 7.2.1, la fiche de notification est traitée conformément aux dispositions du paragraph 7.4.9.2. S'il y a lieu ultérieurement d'inscrire l'assignation dans le Fichier de référence, la date de réception par le Comité de la fiche de notification présentée à nouveau est indiquée dans la colonne Observations.

7.4.9.6. Lorsque l'administration notificatrice présente à nouveau sa fiche de notification en déclarant qu'elle n'a pas eu de succés en tentant d'effectuer la coordination, le Comité en informe les administrations intéressées. Le Comité examine la fiche de notification du point de vue des dispositions du paragraphe 7.4.5.3. S'il y a lieu ultérieurement d'inscrire l'assignation dans le Fichier de référence, la date de réception par le Comité de la fiche de notification présentée à nouveau est indiquée dans la colonne Observations.

7.4.10. *Conclusion favorable aux paragraphes 7.4.5.1. et 7.4.5.3.*

7.4.10.1. L'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notification est inscrite dans la colonne 2d.

7.4.11. *Conclusion favorable relativement au paragraphe 7.4.5.1, mais défavorable relativement au paragraphe 7.4.5.3.*

7.4.11.1. La fiche de notification est retournée immédiatement par poste aérienne à l'administration dont elle émane, avec un exposé des raisons qui motivent la conclusion du Comité et avec les suggestions qu'il peut faire, le cas échéant, pour arriver à une solution satisfaisante du problème.

7.4.11.2. Si l'administration notificatrice présente à nouveau sa fiche avec des modifications qui, après nouvel examen, entraînent de la part du Comité une conclusion favorable relativement au paragraphe 7.4.5.3, l'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notification initiale est inscrite dans la colonne 2d. La date de récéption par le Comité de la fiche de notification présentée á nouveau est indiquée dans la colonne Observations.

7.4.11.3. Dans le cas où l'administration notificatrice présente de nouveau sa fiche de notification, soit non modifiée, soir avec des modifications dont l'effet est diminuer la probabilité de brouillages préjudiciables mais dans des proportions insuffisantes pour permettre l'application des dispositions du paragraphe 7.4.11.2 et où cette administration insiste pour un nouvel examen de la fiche de notification, mais où les conclusions du Comité restent les mêmes, la fiche de notification doit à nouveau être retournée á l'administration notificatrice conformément au paragraphe 7.4.11.1. Dans ces conditions, l'administration notificatrice s'engage à ne pas utiliser l'assignation de fréquence jusqu'à ce que la condition définie au paragraphe 7.4.11.2 puisse être remplie. Mais les administrations intéressées peuvent envisager la possibilité de conclure un accord sur l'utilisation, pendant une période donnée, de l'assignation de fréquence proposée. Dans ce cas, l'IFRB sera averti de l'accord et l'assignation de fréquence sera inscritte dans le Fichier de référence; accompagnée d'une note dans la colonne Observations indiquant que sa validité ne s'étend pas au-delà de la période spécifiée. L'administration notificatrice qui utilise l'assignation de fréquence pendant la durée spécifiée ne doit pas prendre ultérieurement prétexte de cette utilisation pour maintenir l'assignation en service à l'issue de cette période si elle n'obtient pas l'autorisataion de la ou des administrations intéressées. La date de réception par le Comité de la fiche de notification initiale est inscrite dans la colonne 2d.

7.4.12. *Modifications aux caractéristiques fondamentales des assignations déjà inscrites dans le Fichier de référence.*

7.4.12.1. Toute notification de modification aux caractéristiques fondamentales d'une assignation du service fixe par satellite déjà inscrite dans le Fichier de référence, telles qu'elles sont définies à l'appendice 3 au Règlement des radiocommunications (à l'exception toutefois du nom de la station et du nom de la localité dans laquelle elle est située), est examinée par le Comité selon des dispositions du paragraphe 7.4.5.1 et, le cas échéant, des paragraphes 7.4.5.2 et 7.4.5.3 et les dispositions des paragraphes 7.4.7 a 7.4.11.3 inclus sont appliquées. Lorsqu'il y a lieu d'inscrire la modification dans le Fichier de référence, l'assignation initiale est modifiée en conséquence.

7.4.12.2. Cependent, dans le cas d'une modification aux caractéristiques d'une assignation conforme aux dispositions du paragraphe 7.4.5.1 et où les Comité formule une conclusion favorable relativement aux paragraphe 7.4.5.2 et 7.4.5.3, le cas échéant, ou conclut que cette modification n'accroit pas la probabilité de brouillages préjudiciables au détriment d'assignations de fréquence conformes au Plan, l'assignation de fréquence modifiée conserve la date primitivement inscrite dans la colonne 2d. De plus, la date de réception par le Comité de la fiche de notification concernant la modification est indiquée dans la colonne Observations.

7.4.12.3. Dans l'application des dispositions de la présente section, toute fiche de notification présentée de nouveau au Comité et reçue par lui plus de deux ans après la date à laquelle il a renvoyé la fiche à l'administration notificatrice est considérée comme une nouvelle fiche de notification.

7.4.13. *Inscription des assignations de fréquence du service fixe par satellite notifiées avant leur mise en service.*

7.4.13.1. Si une assignation de fréquence notifiée avant sa mise en service est l'objet de conclusions favorables formulées par le Comité relativement au paragraphe 7.4.5.1 et, le cas échéant, aux paragraphes 7.4.5.2 et 7.4.5.3, elle est inscrite provisoirement dans le Fichier de référence avec, dans la colonne Observations, un symbole spécial indiquant le caractère provisoire de cette inscription.

7.4.13.2. Si, dans un délai de trente jours après la date prévue pour la mise en service, le Comité reçoit de l'administration notificatrice la confirmation de la date de mise en service, il biffe le symbole spécial inséré dans la colonne Observations. Au cas où, á la suite d'une demande reçue de l'administration notificatrice avant l'expiration de ce délai de trente jours, le Comité conclut que des circonstances exceptionnelles motivant un délai supplémentaire, ce dernier ne doit en aucun cas dépasser cent cinquant jours.

7.4.13.3. Si le Comité ne reçoit pas la confirmation dans les délais prévus au paragraphe 7.4.13.2, l'inscription en question est annulée. Le Comité avise l'administration intéressée avant de prendre cette mesure.

SECTION V

Inscription des conclusions dans le Fichier de référence

7.5. Chaque fois que le Comité inscrit une assignation de fréquence dans le Fichier de reférence, il indique sa conclusion par un symbole placé dans la colonne 13a. De plus, il porte dans la colonne Observations l'indication des motifs de toute conclusion défavorable.

SECTION VI

Catégories d'assignation de fréquence

7.6.1. La date à inscrire dans la colonne 2c est la date de mise en service notifiée par l'administration intéresseé. Elle est donnée à titre d'information seulement.

7.6.2. Si l'utilisation d'une assignation de fréquence à une station de radiocommunication spatiale qui a été inscrite au Fichier de référence conformément aux dispositions du paragraphe 7.4.11.3 cause effectivement un brouillage préjudiciable à la réception d'un station de radiodiffusion par satellite dont l'assignation de fréquence est conforme au Plan, la station utilisant l'assignation de fréquence inscrite conformément aux dispositions du paragraphe 7.4.11.3 doit faire cesser immédiatement le brouillage préjudiciable lorsqu'elle est avisée dudit brouillage.

7.6.3. Si l'utilisation d'une assignation de fréquence non conforme aux dispositions du paragraphe 7.4.5.1 cause effectivement un brouillage préjudiciable à la reception d'une station de radiodiffusion par satellite quelconque dont l'assignation de fréquence est conforme au Plan, la station utilisant l'assignation de fréquence non conforme aux dispositions du paragraphe 7.4.5.1 doit faire cesser immédiatement le brouillage préjudiciable lorsqu'elle est avisée dudit brouillage.

SECTION VII

Réexamen des conclusions

7.7.1. Une conclusion peut être réexaminée par le Comité:

À la demande de l'administration notificatrice;

À la demande de toute autre administration intéresée à la question, mais uniquement en raison d'un brouillage préjudiciable constaté;

Sur la propre initiative du Comité lui-même lorsqu'il estime cette mesure justifiée.

7.7.2. Le Comité, se fondant sur tous les renseignements dont il dispose, réexamine la question en tenant compte des dispositions du paragraphe 7.4.5.1 et, le cas échéant; des dispositions des paragraphes 7.4.5.2 et 7.4.5.3 et il formule une conclusion appropriée, puis informe de cette conclusion l'administration notificatrice, soit avant de publier la conclusion, soit de la reporter dans le Fichier de référence.

7.7.3. Si la conclusion du Comité est alors favorable, il apporte au Fichier de référence les modifications requises pour que l'inscriptions y figure désormais comme si la conclusion initiale avait été favorable.

7.7.4. Si la conclusion relative à la probabilité d'un brouillage préjudiciable reste défavorable, l'inscription initiale n'est pas modifiée.

SECTION VIII

Modification, annulation et révision des inscriptions du Fichier de référence

7.8.1. Lorsque l'utilisation d'une assignation de fréquence à une station du service fixe par satellite inscrite au Fichier de référence est suspendue pendant une période de dix-huit mois, l'administration notificatrice informe le Comité, au cours de cette période de dix-huit mois, de la date à laquelle cette utilisation a été suspendue et de la date á laquelle l'utilisation régulière de cette assignation reprendra.

7.8.2. Chaque fois qu'il apparaît au Comité, qu'il s'agisse ou non du résultat des mesures prises aux termes du paragraphe 7.8.1, qu'une assignation de fréquence à une station du service fixe par satellite inscrite au Fichier de référence n'a pas été utilisée régulièrement pendant plus de dix-huit mois, le Comité s'enquiert auprès de l'administration notificatrice de la date á laquelle l'utilisation régulière de cette assignation reprendra.

7.8.3. Si, dans un délai de six mois, le Comité ne reçoit aucune réponse à sa demande de renseignements aux termes du paragraph 7.8.2, ou si la réponse qu'il reçoit ne confirme pas que l'utilisation régulière de cette assignation

à une station du service fixe par satellite reprendra dans un délai de six mois, un symbole est inséré dans le Fichier de référence en regard de l'inscription.

7.8.4. Si l'utilisation d'une fréquence inscrite au Fichier de référence vient à être abandonnée définitivement, l'administration notificatrice doit en informer le Comité dans un délai de quatre-vingt-dix jours, à la suite de quoi l'inscription au Fichier de réference est annulée.

7.8.5. Chaque fois qu'il apparaît au Comité, d'après les renseignements dont il dispose, qu'une assignation inscrite dans le Fichier de référence n'a pas été mise en service régulier conformémant aux caractéristiques fondamentales notifiées, on n'est pas utilisée conformément à ses caractéristiques fondamentales notifiées, ou n'est pas utilisée conformément à ses caractéristiques fondamentales, le Comité consulte l'administration notificatrice et, sous réserve de son accord, il annule l'inscription ou lui apporte les modifications qui conviennent.

7.8.6. Si, à la suite d'une enquête faite par le Comité aux termes du paragraphe 7.8.5, l'administration notificatrice n'a pas fourni au Comité dans les 45 jours les renseignements nécessaires ou pertinents, le Comité porte dans la colonne Observations du Fichier de référence, des Observations indiquant la situation.

ARTICLE 8

Dispositions diverses relatives aux procédures

8.1. Si la demande lui en est faite par une administration quelconque et si les circonstances paraissant le justifier, le Comité utilisant à cet effet les moyens dont il dispose et qui conviennent aux circonstances, procède à une étude des cas de présomption de contravention aux présentes dispositions ou de non-observation de celles-ci, ou des cas de brouillage préjudiciable.

8.2. Le Comité établit ensuite un rapport qu'il communique aux administrations intéressées et dans lequel il consigne ses conclusions et ses recommandations pour la solution du problème.

8.3. Dans le cas, où à la suite d'une étude, le Comité présente à une ou plusieurs administrations des propositions ou recommandations tendant á la solution d'une question et où, dans un délai de 90 jours, il n'a pas reçu de réponse d'une ou de plusieurs de ces administrations, il considère que ses propositions ou recommendations ne sont pas acceptables par la ou les administrations qui n'ont pas répondu. Si l'administration requérente elle-même n'a pas répondu dans ce délai, le Comité ne poursuit pas l'étude.

8.4. Si la demande lui en est faite par une administration quelconque et, en particulier, par l'administration d'un pays qui a besoin d'assistance spéciale et si les circonstances paraissent le justifier, le Comité, utilisant à cet effet les moyens dont il dispose et qui conviennent aux circonstances, fournit l'assistance suivante:

a) Calcul nécessaire pour l'application des annexes 1, 3 et 4;

b) Toute autre assistance de caractère technique afin que les procédures décrites dans le présent appendice puissant être ménées á bien.

ARTICLE 9

Limites de la puissance surfacique entre 11,7 GHz et 12,2 GHz pour la protection, dans les Régions 1 et 3, des services de Terre contre les brouillages provenant de stations spatiales de radiodiffusion pasatellites de la Région 2.

9.1. Quelles que soient les conditions et les méthodes de modulation, la puissance surfacique produite à la surface de la Terre dans les Régions 1 et 3 par les émissions d'une station spatiale du service de radiodiffusion par satellite de la Région 2 ne doit pas dépasser, sur le territoire d'un pays quelconque, les limites indiquées à l'annexe 5, sauf si l'administration de ce pays accepte le dépassement.

ARTICLE 10

Limites de la puissance surfacique entre 11,7 GHz et 12,2 GHz pour la protection des services spatiaux de la Région 2 contre les brouillages provenant des stations spatiales du service de radiodiffusion par satellitedes Régions 1 et 3

10.1. Les stations spatiales du service de radiodiffusion par satellite des Régions 1 et 3 doivent utiliser des antennes dont les caractéristiques des lobes latéraux n'excédent pas le diagramme de rayonnement de référence de la figure 6 de l'annexe 8. En conséquence, la puissance surfacique rayonnée sur le territoire d'une quelconque administration de la Région 2 dans la bande 11,7-12,2 GHz avant toute modification au Plan ne devra pas dépasser, quelles que soient les conditions et les méthodes de modulation, les valeurs produites par les stations de radiodiffusion par satellite fonctionnant conformément au Plan à la date de son entrée en vigueur et utilisant les caractéristiques techniques spécifiées dans celui-ci. Les valeurs de la puissance surfacique doivent être calculées selon la méthode décrite dans l'annexe 11.

10.2. En particulier, en un point de référence (35° de longitude Ouest, 8° de latitude Sud) avant toute modification au Plan, les puissances surfaciques ne doivent pas dépasser les valeurs indiquées dans l'annexe 11.

ARTICLE 11

Plan pour le service de radiodiffusion par satellite dans les bandes de fréquences 11,7-12,2 GHz dans la Région 3 et 11,7-12,5 GHz dans la Région 1

11.1. Renseignements inclus dans les colonnes du plan.

Colonne 1 — *Symbole désignant le pays et numéro de référence de l'IFRB* (la colonne 1 contient le symbole désignant le pays ou la zone géographique tiré du tableau N° 1 de la Préface à la liste internationale des fréquences).

Colonne 2 — *Position nominale sur l'orbite,* en degrés.

Colonne 3 — *Numéro du canal* (voir le tableau ci-après pour la correspondance entre les numéros des canaux et les fréquences assignées).

Colonne 4 — *Coordonnées géographiques du point de visée,* en degrés et dixièmes de degrés.

Colonne 5 — *Ouverture du faisceau d'antenne.* La colonne comporte deux valeurs représentant respectivement le grande axe et le petit axe de la section droite du faisceau elliptique entre les points à demi-puissance; ces valeurs sont exprimées en degrés et dixièmes de degrés.

Colonne 6 — *Orientation de l'ellipse* déterminée comme suit: dans un plan perpendiculaire à l'axe du faisceau, la direction du grande axe de l'ellipse est définie par l'angle, mesuré dans le sens inverse des aiguilles d'une montre, à partir d'une ligne parallèle au plan équatorial jusqu'au grand axe de l'ellipse, au degré près le plus proche.

Colonne 7 — *Polarisation* (1 = directe; 2 = indirecte) (1).

Colonne 8 — *P. i. r. e.* dans la direction du rayonnement maximal, en dBW.

Colonne 9 — *Observations.*

11.2. Notes relatives au plan.

1. Le ΔG de cette assignation est ... dB.

2. A affecter au programme islamique prévu dans les documents de la Conférence (2).

3. Cette assignation résulte d'un besoin commun des Administrations du Danemark et de l'Islande. La zone de service comprend les îles Féroé et l'Islande. L'assignation peut, à l'issue des consultations entre les deux Administrations, être utilisée par l'une ou l'autre d'entre elles.

4. IFB — IFRB. Cette assignation a été incluse dans le Plan par la Conférence.

5. Assignation destinée à assurer la couverture de l'Algérie, de la Libye, du Maroc, de la Mauritanie et de la Tunisie, après accord de ces pays. En cas de besoin, elle peut être utilisée avec les caractéristiques du faisceau TUN 150.

6. Les assignations inscrites dans le Plan au nom de la Somalie doivent être coordonnées avec chacun des pays interessées et en particulier avec l'Ethiopie.

11.3. Tableau de correspondance entre le numéro du canal et la fréquence assignée:

Canal numéro	Fréquence assignée (MHz)	Canal numéro	Fréquence assignée (MHz)
1	11 727,48	21	12 111,08
2	11 747,66	22	12 130,26
3	11 765,84	23	12 149,44

ARTICLE 12

Dispositions régissant le service de radiodiffusion par satellite dans la Région 2 en attendant l'établissement d'un plan détaillé

12.1. Conformément aux principes énoncés dans l'annexe 6, on appliquera les dispositions temporaires suivantes jusqu'à ce qu'un plan détaillé soit établi, en vertu des paragraphes 12.9 à 12.12 ci-dessous, pour le service de radiodifussion par satellite fonctionnant dans la bande 11,7-12,2 Ghz dans la Région 2.

12.2. Les stations spatiales du service de radiodiffusion par satellite seront placées dans les portions suivantes de l'orbite:

Entre 75° ouest et 100° Ouest de longitude (toutefois pour la desserte du Canada, des États-Unis et du Mexique, la portion utile sera comprise seulement entre 75° Ouest et 95° Ouest de longitude);
Entre 140° Ouest et 170° Ouest de longitude.

12.2.1. Les stations spatiales du service de radiodiffusion par satellite pourront également être placées en dehors des portions d'orbite indiquées ci-dessus; elles devront alors fonctionner conformément aux dispositions des numéros **420** à **423** du Règlement des radiocommunications. Exceptionnellement, l'utilisation, pour la desserte du Groenland, d'une position sur l'orbite des satellites géostationnaires comprise entre 55° Ouest et 60° Ouest peut être acceptée pour le service de radiodiffusion par satellite (service primaire). Les administrations intéressées doivent faire tous leurs efforts pour permettre le partage de cette portion de l'arc entre un satellite de radiodiffusion destiné au Groenland et des stations spatiales du service fixe d'autres administrations de la Région 2.

12.3. Les stations spatiales du service fixe par satellite seront situées dans les protions d'orbite extérieures aux portions mentionnées dans le paragraphe 12.2; elles pourront également être placées dans les portions d'orbite mentionnées auditi paragraphe 12.2. Dans ce cas, elles devront fonctionner conformément aux dispositions des numéros **420** à **423** du Règlement des radiocommunications.

12.3.1. Les stations spatiales du service de radiodiffusion par satellite situées dans les portions d'orbite mentionnées dans le paragraphe 12.2 et celles du service fixe par satellite situées dans les autres portions de l'orbite devront fonctionner de telle manière que les stations d'un service ne causent aucun brouillage inacceptable aux stations des autres services. Le niveau de brouillage inacceptable sera déterminé par accord entre les administrations intéressés, sur la base des Avis les plus récents du CCIR et des annexes 8 et 9 au présent appendice. Toutefois, les stations spatiales du service de radiodiffusion par satellite pouront être placées à la limite de la portion d'orbite mentionnée dans le paragraphe 12.2, dans la mesure où elles seront conformes aux caractéristiques techniques pertinentes, pour la Région 2, exposées dans l'annexe 8.

12.4. Avant la conférence administrative régionale des radiocommunications mentionnée dans le paragraphe 12.9, les systèmes du service de radiodiffusion par satellite seront considérés comme expérimentaux et ils seront exploités conformément aux critères de partage en aux paramètres techniques figurant dans les annexes 8 et 9.

12.5. Les administrations pourront mettre en oeuvre des systèmes fondés sur des valeurs des caractéristiques techniques qui différent de celles figurant dans l'annexe 8 au présent appendice, à condition qu'il n'en résulte pas, pour les systèmes en service ou prévus des autres administrations, un brouillage plues intense que celui calculé conformément à l'annexe 9.

12.6. La mise en oeuvre de système du service fixe par satellite s'effectuera conformément aux dispositions pertinentes du Règlement des radiocommunications, notamment à celles des articles 11 et 13 et le cas échéant aux dispositions de l'article 7 du présent appendice.

12.7. Dans le bande 11,7-12,2 GHz, les systèmes saptiaux utiliseront, dans toute la mesure ou les questions techniques et économiques le permettront, les techniques qui conduisent à l'utilisation la plus efficace possible de l'orbite des satellites géostationnaires et du spectre des fréquences. A titre d'exemple, on trouvera dans l'annexe 7 la description de telles techniques.

12.8. Les dispositions de la Rèsolution **33** (1) continueront à s'appliquer, dans la Région 2, au service de radiodiffusion par satellite dans la bande 11,7-12,2 GHz jusqu'au moment où un plan détaillé aura pu être adopté pour ce service.

12.9. Une conférence administrative régionale des radiocommunications devra se réunir au plus tard en 1982 afin de procéder à la planification détaillée du service de radiodiffusion par satellite et du service fixe par satelite conformément aux dispositions énoncées aux paragraphes suivants.

12.9.1. Au cours de ladite conférence, on élaborera un plan détaillé de l'utilisation de la ressource orbite/spectre disponible pour le service de radiodiffusion par satellite dans le bande des 11,7-12,2 GHz. Ce plan précisera l'assignation détaillé des positions orbitales et des canaux disponibles, garantissant ainsi que les besoins en matière de radiodiffusion par satellite présentés par chaque administration seront satisfaits de façon équitable pour tous les pays intéressés. Il conviendra de garantir, par principe, à chaque administration de la Région un nombre minimal (4) de canaux pour l'exploitation du service de radiodiffusion par satellite. Au-delà de ce minimum, on tiendra compte des caractéristiques particulières des pays (superfície, zones horaires, diversité linguistique, etc.).

---

(1) Remplace la Résolutionl Spa 2-3 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

12.9.2. La planification sera fondée sur la réception individuelle, bien que chaque administration puisse utiliser le système de réception qui satisfait le mieux ses besoins (réception individuelle, communautaire ou les deux). En outre, ou tiendra compte des décisions des Conférences administratives mondiales des radiocommunications de 1977 et 1979 er des Avis les plus récents du CCIR en ce qui concerne les paramètres qu'il étudie.

12.9.3. Lorsqu'on établira un plan pour le service de radiodiffusion par satellite, il conviendra que les systèmes soient conçus de telle manière que les différences et les incompatiblités techniques avec les autres systèmes des autres Régions soient rèduites au minimum.

12.9.4. La conférence tiendra également compte, de façon équitable, des besoins du service fixe par satellite auquel cette bande de fréquences est aussi attribuée dans la Région 2.

12.10. Toutes les administrations de la Région 2 devront présent à l'IFRB leurs besoins en ce qui concerne le service de radiodiffusion par satellite au plus tard un an avant le début de la conférence administrative régionale des radiocommunications chargée d'établir un plan pour ce service dans la Région 2. Ces besoins pourront être mis à jour au gré des administrations. Elles devront indiquer le nombre et les limites de chaque zone de service ainsi que le nombre de canaux nécessaires pour chaque zone. Six mois avant la date limite fixée pour envoyer les demandes, l'IFRB rappellera aux administrations, par lettre-circularire et ou télégramme, qu'elles sont dans l'obligation de faire connaître leurs besoins.

12.11. Tout système existante ou prévu avant la mise en service d'un plan détaillé tel que le plan ci-dessus mentionné ne devra pas causer de brouillage au détriment d'un système exploité conformément à un tel plan.

12.12. Au moment d'effectuer la planification détaillée du service de radiodiffusion par satellite dans la bande 11,7-12,2 GHz pour la Région 2, il ne sera pas nécessairement tenu compte des systèmes de radiodiffusion par satellite existants ou prévus. Par conséquent, l'établissement ou la planification de tels systèmes par une administration avant l'élaboration du plan ne confère à ces systèmes ni droit ni reconnaissance.

ARTICLE 13

Relation avec la Résolution (1)

13.1. Les dispositions et le Plan associé figurant dans le présent appendice sont considérés comme contenant um acoord mondial et un Plan associé pour les Régions 1 et 3 en vertu du point 1 du dispositif de la Résolution **507** qui demande que les stations du service de radiodiffusion par satellite soient établies et exploitées conformément à des accords et des plans associés.

ARTICLE 14

Brouillages

14.1. Les Membres de l'Union s'efforceront d'étudier de concert les mesures nécessaires en vue de réduire les broouillages préjudiciables qui résulter de la mise en application des présentes dispositions et du Plan associé.

ARTICLE 15 (2)

Entrée en viguer des Actes finals de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977)

ARTICLE 16

Durée de validité des dispositions et du Plan associé

16.1. Les dispositions et le Plan associé cont été établis en vue de satisfaire les besoins du service de radiodiffusion par satellite dans les bandes concernées pour une durée de quinze annés au moins à partir du 1er janvier 1979.

16.2. En tout état de cause, les dispositions et le plan associé demeureront en viguer jusqu'à leur révision par une conférence administrative des radiocommunications competente, convoquée conformément aux dispositions pertinentes de la Convention en vigueur.

ANNEXE I

Limites à prendre en considération pour déterminer si un service d'une administration est défavorablement influencé par un projet de modification au Plan (article 4, paragraphe 4.3.1) (3)

1. *Limites imposées à la modification du rapport signal utile/signal brouilleur vis-à-vis des asssignations de fréquence conformes au Plan.*

En relation avec le paragraphe 4.3.1.1, une administration est considérée comme étant défavorablement influencés si le project de modification au Plan a pour conséquence d'abaisser le rapport signal utile/signal brouilleur, en un point quelconque situé à l'interieur de la zone de service associée l'une de ses assignations de fréquence conforme au Plan, soit au-dessous de 30 dB, soit au-dessous de la valeur résultant des assignations de fréquence du Plan à la date d'entrée en viguer des Actes finals (4) en prenante celle de ces deux valeurs qui est la plus petite.

Note. — Pour effectuer le calcul, l'effect, à l'entrée du récepteur, de tous les signaux dans le même canal ou dans les canaux adjacents, est exprimé en fonction d'un signal brouiller équivalent dans le même canal. Cette valuer est habituellement exprimée en décibels.

---

(1) Remplace la Résolution Spa 2-3 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

(2) Cet article n'est pas reproduit dans le présent appendice; voir la note de bas de page se rapportant au titre du présent appendice.

(3) Les limites specifiées dans cette annexe se rapportent à la puissance surfacique obtenue en supposant une propagation en espace libre.

(4) Actes finals de la Conférence administrative mondiale des radiocommunication pour la radiodiffusion par satellite (Génève, 1977) entrés en viguer le 1er janvier 1979.

2. *Limites imposées à la modification de la puissance surfacique en vue de la protection du service de radiodiffusion par satellite dans la bande 11,7-12,2 GHz, dans la Région 2.*

En relation avec le paragraphe 4.3.1.2, une administration de la Région 2 est considérée comme étant défavorablement influencée si le project de modification au Plan se traduit par un dépassement des valuers suivantes de la puissance surfacique en un point quelconque de la zone de service défavorablement influencée:

147 dB(W/m2/27 MHz) $0° \leq \theta < 0,48°$
$139 + 25 \log \theta$ dB(W/m^2/27 MHz) $0,48° \leq \theta < 27,25°$
103 dB(W/m^2/27 MHz) $\theta \geq 27,25°$

θ représent la différence en degrés entre la longitude de la sation de radiodiffusion de la Région 1 ou de la Région 3 et la longitude de la station spatiale de radiodiffusion de l'administration défavorablement influencée dans la Région 2.

3. *Limites imposées à la modification de la valeur de a puissance surfacique en vue de la protection des services de Terre des autres administrations.*

En relation avec la paragraphe 4.3.1.3, une administrations de la Région 1 ou de la Région 3 est considérée comme étant défavorablement influencée si le projet de modification au Plan a pour conséquence d'acroître la valuer de la puissance surfacique, sur une partie quelconque du territoire de cette administration, de plus de 0,25 dB par rapport à celle résultant des assignations de fréquence conformes au Plan au moment de l'entrée en vigueur des Actes finals ([1]).

La même administration est considérée comme n'étant pas défavorablement influencée si la valeur de la puissance surfacique produite sur toutes les parties de son territoire ne dépasse pas les limites spécifiées dans l'annexe 5.

Une administration de la Région 2 est condidérée comme étant défavorablement influencée si le projet de modification au Plan se traduit par le fait que, en un point quelconque du territoire relevant de cette administration et pour tous les angles d'arrivée, la puissance surfacique dépasserait — 125 dB(W/m2/4 kHz) lorsque la station de radiodiffusion par satellite fonctionne avec polarisation circulaire, et — 128 dB(W/m^2/4 kHz) lorsqu'elle fonctionne avec polarisation rectiligne.

4. *Limites imposées à la modification de la puissance surfacique en vue de la portection du service fixe par satellite de la Région 2, dans la bande 11,7-12,2 GHz*

En relation avec le paragraphe 4.3.1.4, une administration de la Région 2 est considérée comme étant défavorablement influencée si le projet de modification au Plan a pour effet d'augmenter, sur son territoire, la puissance surfacique de 0,25 dB ou plus par rapport à la valeur résultant des assignations de fréquence du Plan au moment de l'entrée en viguer des Actes finals ([1]).

Toutefois, dans le cas ou une assignation de fréquence du Plan, ou ses modifications ultérieures, produit une puissance surfacique inférieure à — 138 dB(W/m2/27 MHz) dans une partie quelconque du territoire dune administrations de la Région 2, cette administrations n'est pas considérée comme étant défavorablement influencée.

ANNEXE 2

Caractéristiques fondamentales à inscrire dans les notifications relatives aux stations spatiales du service de radiodiffusion par satellite

1. Pays et numéro IFRB.
2. Position nominale sur l'orbite (en degrés à partie du méridien de Greenwich).
3. Fréquence assignée ou numéro de canal.
4. Date de mise en service.
5. Identité de la station spatiale.
6. Zone de service (la zone de service peut être défine, si nécessaire, par un certain nombre de «points de calcul»).
7. Coordonnés géographiques de l'intersection de l'axe du faisceau d'antenne avec la surface de la Terre.
8. Zone hydrométéorologique.
9. Classe de la station.
10. Classe d'emission et largeur de bnde nécessaire.
11. Puissance délivrée à l'antenne (dBW).
12. Caractéristiques de l'antenne:

Gain de l'antenne par rapport à une antenne isotropoe;
Forme du faieceau (elliptique ou circulaire);

Grand axe (degrés) aux points à — 3 dB;
Petit axe (degrés) aux points à — 3 dB;

([1]) Actes finals de la Conférence administrative mondiale des radiocommunication pour la radiodiffusion par satellite (Génève, 1977) entrés en viguer le 1er janvier 1979.

Orientation de l'ellipse;
ΔG (différence entre le gain maximal entre le gain vers le point de la zone de service où la puissance surfacique est minimale;
Précision de pointage;
Type de polarisation;
Sens de polarisation;
Diagramme de rayonnement et caractéristiques de la composante contrapolaire.

13. Précision du maintien en position.
14. Caractéristiques de modulation:

Type de modulation;
Caractéristiques de préaccentuation;
Norme de télévision;
Caratéristiques de radiodiffusion sonore;
Excursion de fréquence;
Composition de la bande de base;
Type de multiplexage des signaux image et son;
Caractéristiques de la dispersion de l'énergie.

15. Angle de site minimal dans la zone de service.
16. Type de réception (individuelle ou communautaire).
17. Horaire de fonctionnement (UTC).
18. Coordination.
19. Accords.
20. Autres renseignements.
21. Administration ou compagnie exploitant la station.

ANNEXE 3

Méthode permettant de déterminer la valeur limite de la puissance surfacique brouilleuse à la limite de la zone de service d'une station spatiale de radiodiffusion par satellite dans les bandes de fréquences 11,7-12,2 GHz (dans les Régions 2 et 3) et 11,7-12,5 Ghz (dans la Région 1) et calcul de la puissance surfacique produite à cette limite par une station de Terre.

1. *Considerations générales.*

1.1. La présent annexe décrit une méthode de calcul du brouillage pouvant être causé par des émetteurs de Terre à des récepteurs de radiodiffusion par satellite dans la bande de fréquences 11,7-12-2 GHz (11,7-12,5 GHz dans la Région 1).

1.2. La méthode à suivre comprend deux étaps:

a) Calcul de la valeur maximale admissible de la puissance surfacique brouilleuse à la limite de la zone de service de la station spatiale de radiodiffusion par satellite concernée;
b) Calcul de la valeur probable de la puissance surfacique produite, en un point quelconque de la limite de la zone de service, par l'émetteur de terre d'une autre administration.

1.3. Il faut examiner cas par cas le brouillage pouvant être causé par les émetteurs de Terre: on compare la puissance surfacique produite par chaque émetteur de Terre avec la valeur limite de la puissance surfacique en tout point de la limite de la zone de service d'une station du service de radiodiffusion par satellite d'une autre administration. Si, pour un émetteur donné, la valeur de la puissance surfacique est inférieure à la valeur admissible fixée pour um point quelconque de la limite de la zone de service, on considère que le brouillage causé par l'émetteur au service de radiodiffusion par satellite est inférieur à la valeur admissible et les administrations sont dispensées de coordination avant la mise en œuvre du service de Terre. Lorsqu'il en est autrement, il est nécessaire d'effectuer une coordination et des calculs plus précis, sur une base acceptée par des deux parties concernées.

1.4. Il faut souligner que si les calculs décrits dans la présente annexe révèlent un dépassement de la puissance surfacique maximale admissible, cela n'interdit pas nécessairement l'introduction du service de Terre, puisque les calculs sont obligatoirement fondés sur les hypothèses les plus défavorables concernant:

a) La nature du terrain sur le trajet de brouillage;
b) La discrimination exercée par les installations de réception de radiodiffusion par satellite à l'égard des émissions hors faisceau;
c) Les rapports de protection nécessaires pour le service de radiodiffusion par satellite;
d) Le type de réception dans le service de radiodiffusion par satellite (en l'occurrence la réception individuelle); aux angles de site considerés, ce type de réception pose davantage de problèmes que la réception communautaire;
e) La valeur de la puissance surfacique à protéger dans le service de radiodiffusion par satellite;
f) Les conditions de propagation entre la station de Terre et la zone de service du satellite de radiodiffusion.

2. *Limite de la puissance surfacique.*

2.1. *Considérations générales.*

La valeur admissible de la puissance surfacique à ne pas dépasser à la limite de la zone de service, pour protéger le service de radiodiffusion par satellite d'une administation, est donnée par la formule:

$$F = F_o - R + D + P \quad (1)$$

dans laquelle:

F — valeur maximale admissible de la puissance surfacique brouilleuse [en dB(W(m²)] dans la largeur de bande nécessaire des émission de radiodiffusion par satellite;
F_o — puissance surfacique utile [en dB(W/m²)] à la limite de la zone de service;
R — rapport de protection (en dB) signal utile/signal brouilleur;
D — discrimination angulaire (en dB) assurée par le diagramme de rayonnement de l'antenne du récepteur de radiodiffusion par satellite;
P — discrimination de polarisation (en dB) entre les signaux utile et brouilleur.

2.2. *Puissance surfacique utile (F_o).*

La valeur de F_o est égale à:

a) — 103 dB(W/m²) pour les zones de services dans les Régions 1 et 3;
b) — 105 dB(W/m²) pour les zones de service dans la Région 2.

2.3. *Rapport de protection (R).*

2.3.1. Dans le cas d'une contribution unique de brouillage, le rapport de protection contre tous les types d'émissions de Terre, sauf les émissions des systèmes de télévision multicanaux à modulation d'amplitude, est de 35 dB lorsque la différence entre les fréquences porteuses du signal utile et du signal brouilleur est égale ou inférieure à ± 10 MHz; il décroît linéairement de 35 dB à 0 dB lorsque la différence entre les fréquences porteuses passe de 10 MHz à 35 MHz; il est égal à 0 dB pour des différences de fréquence dépassant 35 MHz (voir la figure 1).

2.3.2. La différence entre les fréquences porteuses; doit être déterminée sur la base des assignations de fréquence figurant dans le Plan de radiodiffusion par satellite, ou, dans le cas des stations spatiales de radiodiffusion qui ne sont pas comprises dans un plan, sur la base des caractéristiques du système en service ou en projet. Pour des systèmes de télévision multicanaux à modulation d'amplitude qui produisent de grandes crêtes de puissance surfacique échelonnées sur une grande partie de la largeur de bande occuppée, le rapport de protection R est égal à 35 dB, quel que soit l'espacement des fréquences porteuses.

2.3.3. On ne prendra en considération um signal d'une station de Terre que si sa largeur de bande nécessaire recouvre en partie la largeur de bande nécessaire d'une assignation à une station du service de radiodiffusion par satellite.

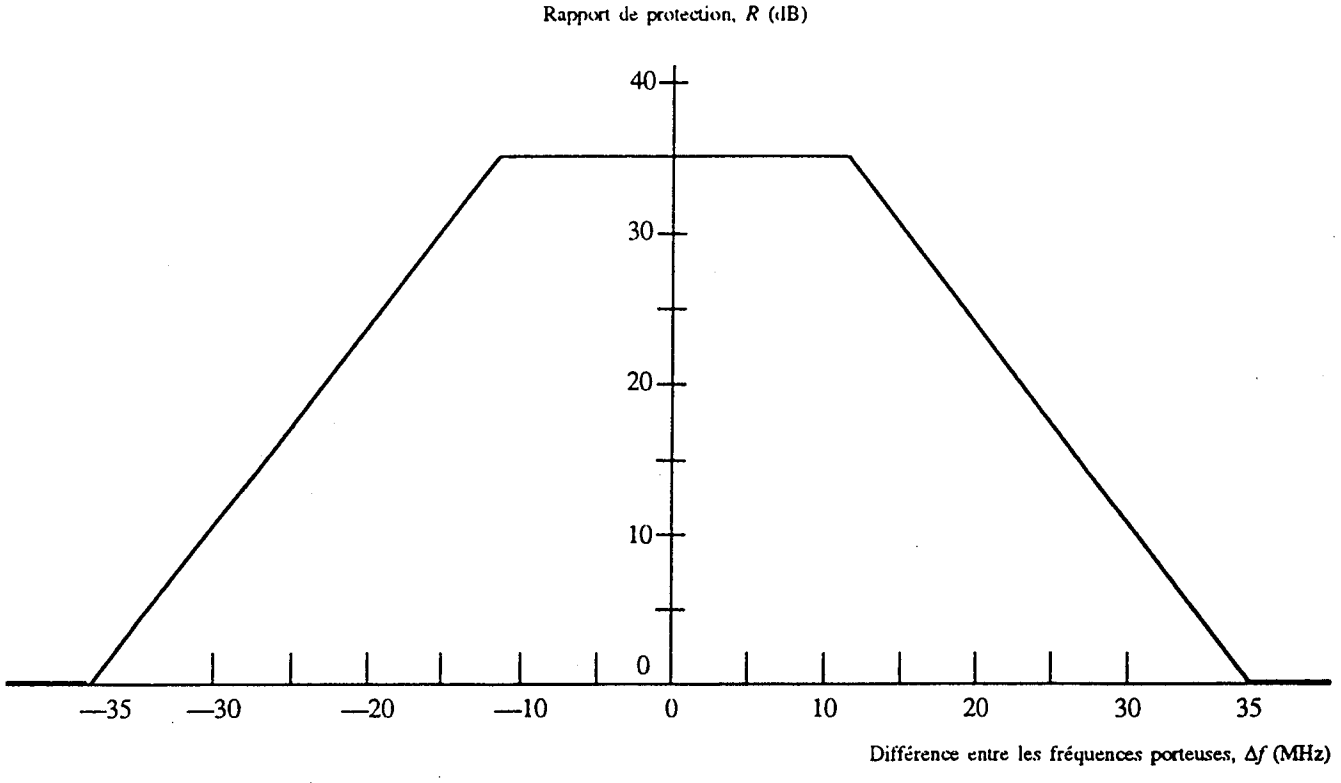

Figure 1 — Rapport de protection, R (dB), d'un signal de radiodiffusion vis-à-vis d'une seule source de brouillage provenant d'un service de Terre (sauf pour les systèmes de télévision multicanaux à modulation d'amplitude)

2.4. *Discrimination angulaire (D).*

2.4.1. *Zones de service des stations spatiales du service de radiodiffusion par satellite dasn les Régions 1 et 3.*

Lorsque, pour une zone de service considerée, l'angle se site (φ) choisi pour un système de radiodiffusion par satellite, en service ou en projet, est égal ou supérieur à 19°, on admet que, dans la fomule (1), $(D) = 33$ dB. Si φ est inferieur à 19° on calcule (D) à partir des formules (2a) ci-aprés.

Note. — Si plusieurs valeurs de φ sont spécifiées pour une zone de service donnée, on utulise la valeur appropriée à chaque portion de la limite de ladite zone de sercice.

$$\begin{aligned} D &= 0 \text{ pour } 0 \le \varphi \le 0{,}45° \\ D &= 3{,}7\ \varphi^2 \text{ pour } 0{,}5° < \varphi \le 1{,}41° \\ D &= 3 + 20 \log_{10} \varphi \text{ pour } 1{,}41° < \varphi \le 2{,}52° \\ D &= 1 + 25 \log_{10} \varphi \text{ pour } 2{,}52° < \varphi \le 19° \end{aligned} \qquad (2a)$$

Note. — Pour la détermination graphique de (D), voir la figure 2.

2.4.2. *Zones de service des stations spatiales du service de radiodiffusion par satellite dans la Région 2.*

Lorsque, pour une zone de service considérée, l'angle de site (φ) choisi pour un système de radiodiffusion par satellite, en service ou en projet, est égal ou supérieur à 27°, on admet que, dans la formule (1), $(D) = 38$ dB. Si φ est inférieur à 27°, on calcule (D) á partir des formules (2b) ci-après.

Note. — Si plusieurs valeurs de φ sont spécifiées pour une zone de service donnée, on utilise la valeur appropriée à chaque portion de la limite de ladite zone de service.

$$\begin{aligned} D &= 0 \text{ pour } 0 \le \varphi \le 0{,}45° \\ D &= 3{,}7\ \varphi \text{ pour } 0{,}45° < \varphi \le 1{,}27° \\ D &= 3{,}9 + 20 \log_{10} \varphi \text{ pour } 1{,}27° < \varphi \le 2{,}27° \\ D &= 2{,}1 + 25 \log_{10} \varphi \text{ pour } 2{,}27° < \varphi \le 27° \end{aligned} \qquad (2b)$$

Note. — Pour la détermination graphique de (D), voir la figure 2.

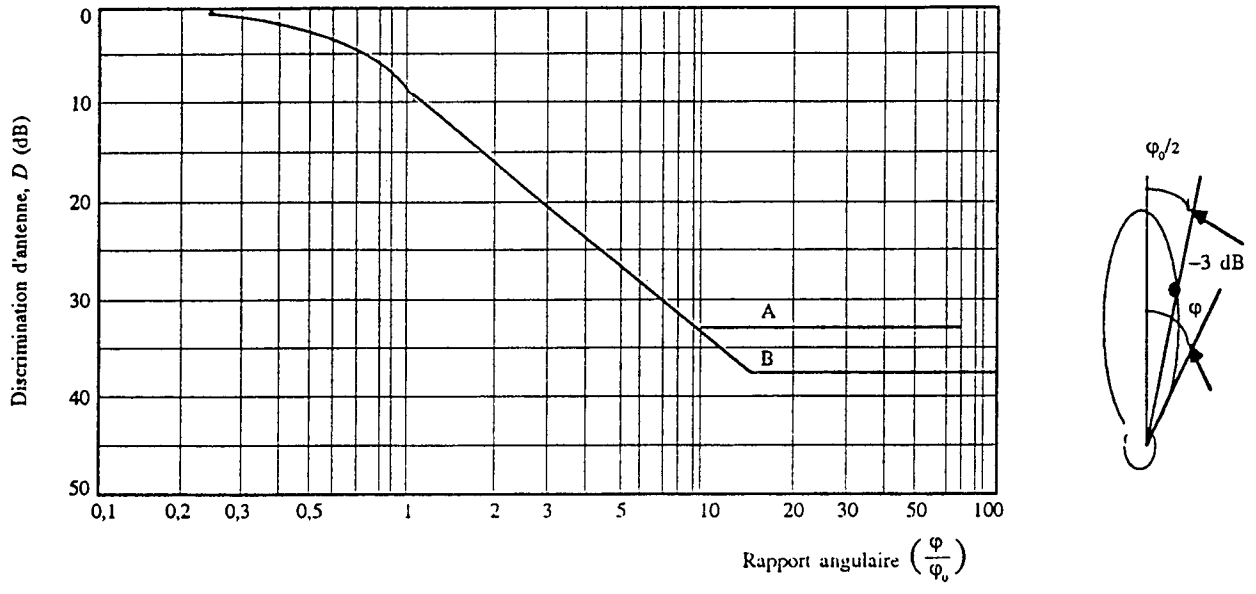

Figure 2 — Discrimination d'antenne, D (db), d'un récepteur de radiodiffusion par satellite en fonction de l'angle de site du satellite

Pour les zones de service dans les Régions 1 et 3, $\varphi_0 = 2°$; la courbe A s'applique.
Pour les zones de service dans la Région 2, $\varphi_0 = 1{,}8°$; la courbe B s'applique.

2.5. *Discrimination de polarisation (P).*

La valeur de P est égale à:

a) 3 dB, lorsque le service de Terre brouilleur utilise la polarisation rectiligne et le service de radiodiffusion par satellite la polarisation circulaire, ou vice-versa;

b) 0 dB, lorsque le service de Terre brouilleur et le service de radiodiffusion par satellite utilisent tous deux la même polarisation, circulaire ou rectiligne.

3. *Puissance surfacique produite par une station de Terre (F_p).*

La puissance surfacique F_p [en dB(W/m²)] produite par une station de Terre en un point quelconque de la limite de la zone de service est déterminée par la formule suivante:

$$F_p = E - A + 43 \qquad (3)$$

dans laquelle:

E — puissance isotrope rayonnée équivalente (en dBW) de la station dans la direction du point considéré de la limite de la zone de service;

A — affaiblissement de trajet total (en dB).

3.1. *Evaluation de l'affaiblissement de traject A pour une station de Terre située à plus de 100 km de la limite de la zone de services d'une station spatiale de radiodiffusion par satellite.*

Pour des trajets d'une longueur supérieure à 100 km, la valeur de A est la suivante:

$$A = 137{,}6 + 0{,}2324\, d_t + 0{,}0814\, d_m \qquad (4)$$

dans laquelle d_t et d_m représenten respectivement (en km) la longueur du trajet terrestre et la longueur du trajet maritime.

3.2. *Evaluation de l'affaiblissement de trajet A pour une station de Terre située à une distance égale ou inférieure à 100 km de la limite de la zone de service d'une station de radiodiffusion par satellite.*

Pour des trajets d'une longueur égale ou inférieure à 100 km, on calcule la valeur de *A* au moyen des formules (4) et (5); la valeur la plus faible est introduite dans la formule (3) pour calculer la puissance surfacique produite au point considéré de la limite de la zone de service:

$$A = 109{,}5 + 20 \log\, (d_t + d_m) \qquad (5)$$

La figure 3 donne la valeur de *A* en fonction de la longueur totale du trajet et des proportions de trajet maritime.

3.3. *Distance au-delà laquelle l'application de la méthode n'est plus nécessaire.*

Il n'est plus nécessaire d'appliquer la méthode et la coordination est inutile si la distance entre la station de Terre et la zone de service de la station spatiale de radiodiffusion par satellite et supérieure à:

a) 400 km dans le cas de trajets entièrement terrestres; ou

b) 1200 km dans le cas de trajets entièrement maritimes ou de trajets mixtes.

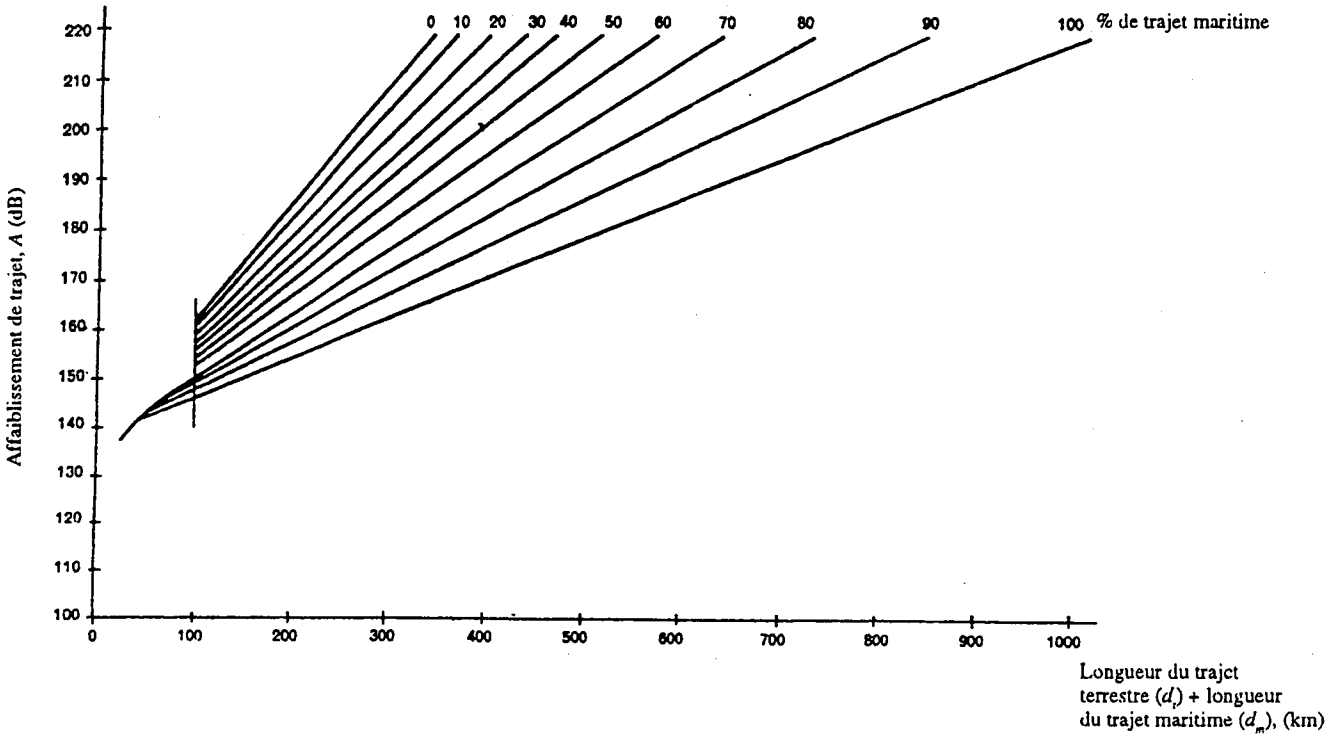

Figure 3 — Affaiblissement total de trajet, *A* (dB), en fonction de la longueur totale du trajet $(d_t + d_m)$ et des pourcentages de trajet maritime

ANNEXE 4

Nécessité de coordonner, par rapport au Plan, une station spatiale du service fixe par satellite ou une station spatiale du service de radiodiffusion par satellite de la Région 2 (article 7)

En relation avec le paragraphe 7.2.1, la coordination d'une station spatiale du service fixe par satellite ou du service de radiodiffusion par satellite de la Région 2 est requise lorsque, dans l'hypothèse de la propagation en espace libre, la valeur de la puissance surfacique produite sur le territoire relevant d'une administration de la Région 1 ou de la Région 3 dépasse la valeur définie par les expressions suivantes:

— 147 dB (W/m²/27 MHz) pour $0 \leq \theta < 0{,}44°$;
— $138 + 25 \log 0$ dB (W/m²/27 MHz) pour $0{,}44 \leq \theta < 19{,}1°$;
— 106 dB (W/m²/27 MHz) pour $19{,}1° \leq 0$;

θ = différence en degrés entre la longitude de la station spatiale brouilleuse du service de radiodiffusion par satellite ou du service fixe par satellite dans la Région 2 et la longitude de la station spatiale du service de radiodiffusion par satellite défavorablement influencée dans les Régions 1 et 3.

ANNEXE 5

Valeurs limites de la puissance surfacique à apliquer pour la protection des services de Terre dans les Régions 1 et 3 contre les brouillages produits par les stations spatiales du service de radiodiffusion par satellite de la Région 2, dans la bande 1,7-12,2 GHz (article 9)

Les valeurs limites de la puissance surfacique à appliquer dont les suivantes:

1) Pour tous les territoires des administrations des Régions 1 et 3 et pour tous les angles d'arrivée:
   — 125 dB (W/m²/4 kHz) pour des stations spatiales de radiodiffusion par satellite utilisant la polarisation circulaire;
   — 128 dB(W/m²/4 kHz) pour les stations spatiales de radiodiffusion par satellite utilisant la polarisation rectiligne; et

2) Pour les territoires des administrations de la Région 3 et ceux de la partie occidentale de la Région 1 situés à l'ouest de la longitude 30° Est:
   — 132 dB (W/m²/5 MHz) pour des angles d'arrivée compris entre 0° et 10° au-dessus de l'horizon;
   — $132 + 4{,}2 (\gamma - 10)$ dB (W/m² /5 MHz) pour des angles d'arrivée γ (en degrés) compris entre 10° et 15° au-dessus de l'horizon;
   — 111 dB (W/m²/5 MHz) pour des angles d'arrivée compris entre 15° et 90° au-dessus de l'horizon.

ANNEXE 6

Principes de planification dans la Région 2

Les principes suivantes ont été appliqués lors de l'élaboration des dispositions régissant la mise en œuvre des services de radiocommunication spatiale dans la bande 11,7-12,2 GHz dans la Région 2:

1. *Egalité des droits entre les services auxquels est attribuée la bande dans la Région 2.*

Aux termes de l'article 8 du Règlement des radiocommunications, la bande 11,7-12,2 GHz est attribuées au service de radiodiffusion par satellite, au service fixe par satellite et à des services de radiocommunication de Terre à titre primaire avec égalité des droits. Chaque administration de la Région 2 a le droit de décider par elle-même des services qu'elle mettra en œuvre sur son propre territoire.

2. *Egalité des droits entre des services de différentes Régions.*

Conformément aux dispositions du numéro **346** du Règlement des radiocommunications, dans totues les Régions le fonctionnement de services différents de même bande de fréquences est fondé sur le égalité des droits, sous réserve de ne causer aucun brouillage préjudiciable aux services des autres Régions.

3. *Reconnaissance des besoins nationaux.*

Toutes les administrations de la Région 2 prendront en considération les besoins nationaux qui ont été présentés ou qui le seront dans l'avenir.

4. *Droits d'accès équitables à la ressource orbite/spectre.*

Sou réserve des dispositions de la Convention du Réglement des radiocommunications et des résolutions en vigueur, il est reconnu que toutes les administrations ont droit d'accès à la ressource orbite/spectre pour fairé face à leurs propres besoins.

5. *Méthode de planification souple* (1).

Le plan pour la Région 3 qui sera adopté devra être assez souple pour permettre de tenir compte: de l'évolution future de la technique, de la détermination des besoins à venir, des modifications des besoins actuels ou des besoins formulés, des besoins des administrations non représentées à la Conférence (2), des données nouvelles relatives à la propagation et des diverses méthodes de conception des systèmes. Le plan ne pourra être modifié que par une conférence administrative des radiocommunications compétente.

6. *Utilisation efficace de l'orbite des satellites géostationnaires et du spectre.*

Le plan pour la Région 2 utilisera, dans la mesure où ce sera techniquement et économiquement possible, les techniques le plus récents afin d'employer avec le maximum d'efficacité l'orbite des satellites géostationnaires et le spectre de fréquences pour satisfaire aux besoins globaux des Régions ainsi qu'à ceux de chaque administration.

7. *Consultations entre administrations.*

Les administrations envisageant la mise en œuvre de systèmes dans la bande 11,7-12,2 GHz consulteront toutes les autres administrations affectées ou intéressées.

8. *Réception.*

Le plan pour la Région 2 sera établi sur la base de la réception individuelle: toutefois, chaque administration pourra adopter le système de réception qui conviendra le mieux à ses besoins: réception individuelle, réception communitaire ou les deux.

ANNEXE 7

Utilisation de la resource orbite/spectre

Etant donnée que, dans la Région 2, le partage des ressources de l'orbite/spectre entre le service de radiodiffusion par satellite et le service fixe par satellite sur la base de l'égalité des droits est difficile à réaliser et peut imposer certaines restrictions aux deux services, il importe de choisir les paramètres techniques et d'appliquer les techniques conduisant à une utilisation efficace de la ressource orbite/spectre de telle sorte que les deux services spatiaux en tirent le meilleur parti possible.

Les techiques énumérées ci-dessous font partie de celles qui permettent l'utilisation de la ressource orbite/spectre la plus efficace; elles doivent donc être appliquées avec le maximum d'efficacité dans la mesure où cela sera techniquement et économiquement possible, compte tenu de la capacité des systèmes à répondre aux besoins pour lesquells ils ont été conçus.

1. *Groupement.*

Des analyses très poussées ont montré que l'utilisation de l'orbite est améliorée lorsque les stations spatiales sont groupées selon la vulnerabilité au brouillage du système dont elles font partie et le brouillage que risque de causer ce système. Souvent, cela signifie que des stations spatiales à caractéristiques similares doivent être groupées dans la même partie de l'orbite.

2. *Croisement de polarisation.*

L'utilisation correcte du croisement de polarisation peut améliorer notablement l'utilisation de la ressource orbite/spectre en assurant une séparation supplémentaire entre des systèmes qui risquent de se brouiller.

3. *Géométrie des faisceaux croisés.*

Le principe de la géométrie des faisceaux croisés est le suivant: des stations spatiales adjacentes ne doivent pas desservir des zones de service adjacentes. On peut ainsi utiliser la discrimination des antennes de station spatiale et de station terrienne pour parvenir à la séparation maximale entre les systèmes.

4. *Zones de service appariées.*

On peut étendre à ce cas l'application du principe de la géométrie des faisceaux croisés. En effet, si les zones de service sont assez éloignées l'une de l'autre, la seule discrimination de l'antenne de la station spatiale peut suffire pour que les stations spatiales desservant ces zones occupent la même position sur l'orbite, ce qui permet pratiquement de doubler la capacité de l'orbite.

5. *Entrelacement des fréquences.*

Dans des systèmes différents, le brouillage mutuel entre les canaux atteint généralement sont maximum lorsque les deux fréquences porteuses coincident. Lorsque la disposition des canaux est telle que les fréquences sont entrelacées, ou, plus généralement, que l'on évite la coïncidence des fréquences porteuses, le brouillage mutuel peut fréquemment être réduit dans les notables proportions.

---

(1) Le paragraphe 5 n'implique pas la reconnaissance de systèmes exploités avant la mise en œuvre du plan.

(2) Conférence administrative mondiale des radiocommunications pour la radiodiffusion para satellite (Genève, 1977).

6. *Espacement minimal des stations spatiales.*

Il est évident que, pour parvenir à une utilisation maximale de l'orbite, il convient de placer les stations spatiales aussi près que possible l'une de l'autre, dans le mesure où les brouillages mutuels peuvent être maintenus à des niveaux acceptables.

7. *Discrimination de l'antenne de station spatiale.*

La discrimination dans les lobes latéraux de l'antenne de station spatiale détermine le degré de séparation existant entre les faisceaux desservant des zones de service qui ne se chevauchent pas et qui ne sont pas adjacentes. Pour parvenir à la séparation maximale, tout doit être fait pour améliorer la discrimination grâce aux progrès de la technique de conception et de construtions des antennes.

8. *Discrimination de l'antenne de station terrienne.*

La discrimination dans les lobes latéraux de l'antenne de station terrienne détermine le degrés de séparation obtenu par l'espacement des stations spatiales. Pour parvenir à une séparation maximale, tout doit être fait pour améliorer la discrimination, en tirant parti des techniques avancées de conception et de construction des antennes.

9. *Réduction au minimum des différences de p. i. r. e.*

Le brouillage causé par des stations spatiales relativement puissances (satellite de radiodiffusion ou certains types de satellites du service fixe) à des stations terriennes de réception est directement proportionnel à la différence entre leurs p. i. r. e. Le partage entre de telles stations spatiales est grandement facilité lorsque cette différence est maintenue à la plus faible valeur possible, compte tenu des besoins.

10. *Objectifs réalistes de qualité et de fiabilité.*

Les objectifs de qualité et de fiabilité ont une influence significative sur l'utilisation de la ressource orbite/spectre. Des objectifs inutilement élevés entraînent une diminution de la capacité de l'orbite; ils ne doivent donc pas être plus élevés qu'il n'est absolument nécessaire.

ANNEXE 8

Données techniques utilisées pour l'établissement du Plan et devant être utilisées pour l'application du Plan

1. *Définitions.*

1.1. *Zone de service.*

Zone de la surface de la Terre dans laquelle l'administration responsable du service est fondée à exiger que la protection convenue soit observée.

Note.— Selon la définition de la zone de service, il apparaît clairement, qu'á l'intérieur de cette zone, les conditions de protection convenues peuvent être exigées. Dans ladite zone, on doit trouver au moins: une puissance surfacique appropriée une protection contre les brouilleurs basée sur un rapport de protection convenu durant une fraction également convenue du temps.

1.2. *Zone de couverture.*

Zone délimité à la surface de la Terre par un contour en tout point duquel la puissance surfacique a une valeur constante convenue, laquelle, en l'absence de brouillage, permet d'obtenir la qualité de réception spécifiée.

Note 1. — Conformément aux dispositions du numéro 2674 du Règlement des radiocommunications, la zone de couverture doit être la plus petite possible, tout en englobant la zone de service.

Note 2. — La zone de couverture englobe normalement toute la zone de service. Elle résulte de l'intersection du faisceau (de section elliptique ou circularie) avec la surface de la Terre. Elle est définie par une valeur donnée de la puissance surfacique. Par exemple, dans le cas d'un pays de la Région 1 ou de la Région 3 dont le service est prévu pour une réception individuelle, ce serait la zone limitée par le contour correspondant à une puissance surfacique de — 103 dB (W/m²) pendant 99 % du moins le plus défavorable. En général, il existera une zone intérieure à la zone de couverture mais extérieure à la zone de service, dans laquelle la puissance surfacique sera supérieure à la valeur minimale spécifiée, mais où la protection contre les brouillages ne sera pas assuré.

1.3. *Empreinte d'un faisceau.*

Zone delimité par l'intersection du faisceau à mi-puissance de l'antenne d'émission du satellite avec la surface de la Terre.

Note. — L'empreinte du faisceau d'est autre que la zone de la surface de la Terre délimité par les points à — 3 dB du diagramme de rayonnement de l'antenne d'émission du satellite. Dans bien des cas, l'empreinte coincide presque avec la zone de couverture. Quand elle en diffère, cela s'explique par les différences permanentes de longueur des trajects entre le satellite et les différentes points de l'empreinte du faisceau, et aussi, le cas échéant, par les variations également permanentes des facteurs de propagation relatifs à cette zone. Cependant pour une zone de service dont la dimension maximale est vue du satellite sous un angle inférieure à 0,6° (valeur admisse comme étant a valeur minimale réalisable de l'ouverture à mi-puissance du faisceau), il peut y avoir une différence importante entre l'empreinte du faisceau et la zone de couverture.

1.4. *Position nominale sur l'orbite.*

Longitude d'une position sur l'orbite des satellites géostationnaires associée à une assignation de fréquence à une station spatiale d'un service de radiocommunication spatiale. Cette position est exprimée en degrés à partir du méridien de Greenwich.

2. *Facteurs de propagation radioélectrique.*

2.1. L'affaiblissement de propagation sur le traject espace vers Terre est égal à affaiblissement en espace libre augmenté de l'affaiblissement supplémentaire dépassé pendant a plus 1 % du mons le plus défavorable: ce dernier est indiqué par la figure 1 pour les cinq zones hydrométéorologiques définies dans la figure 2.

2.2. Lorsque l'on utilise les courbes de la figure 1, la différence entre l'affaiblissement par temps clair et l'affaiblissement pendant 99 % du mois le plus défavorable doit être limitée à 2 dB au maximum, grâce à un choix judicieux de l'angle de site.

2.3. Dans le planification du service de radiodiffusion par satellite, pour les émissions à polarisation circulaire, on doit utiliser le rapport suivant entre le niveau dela composante dépolarisée et celui de la composante copolaire:

Pour les zones hydrométéorologiques 1 et 2: — 27 dB;
Pour les zones hydrométéorologiques 3, 4 et 5: — 30 dB.

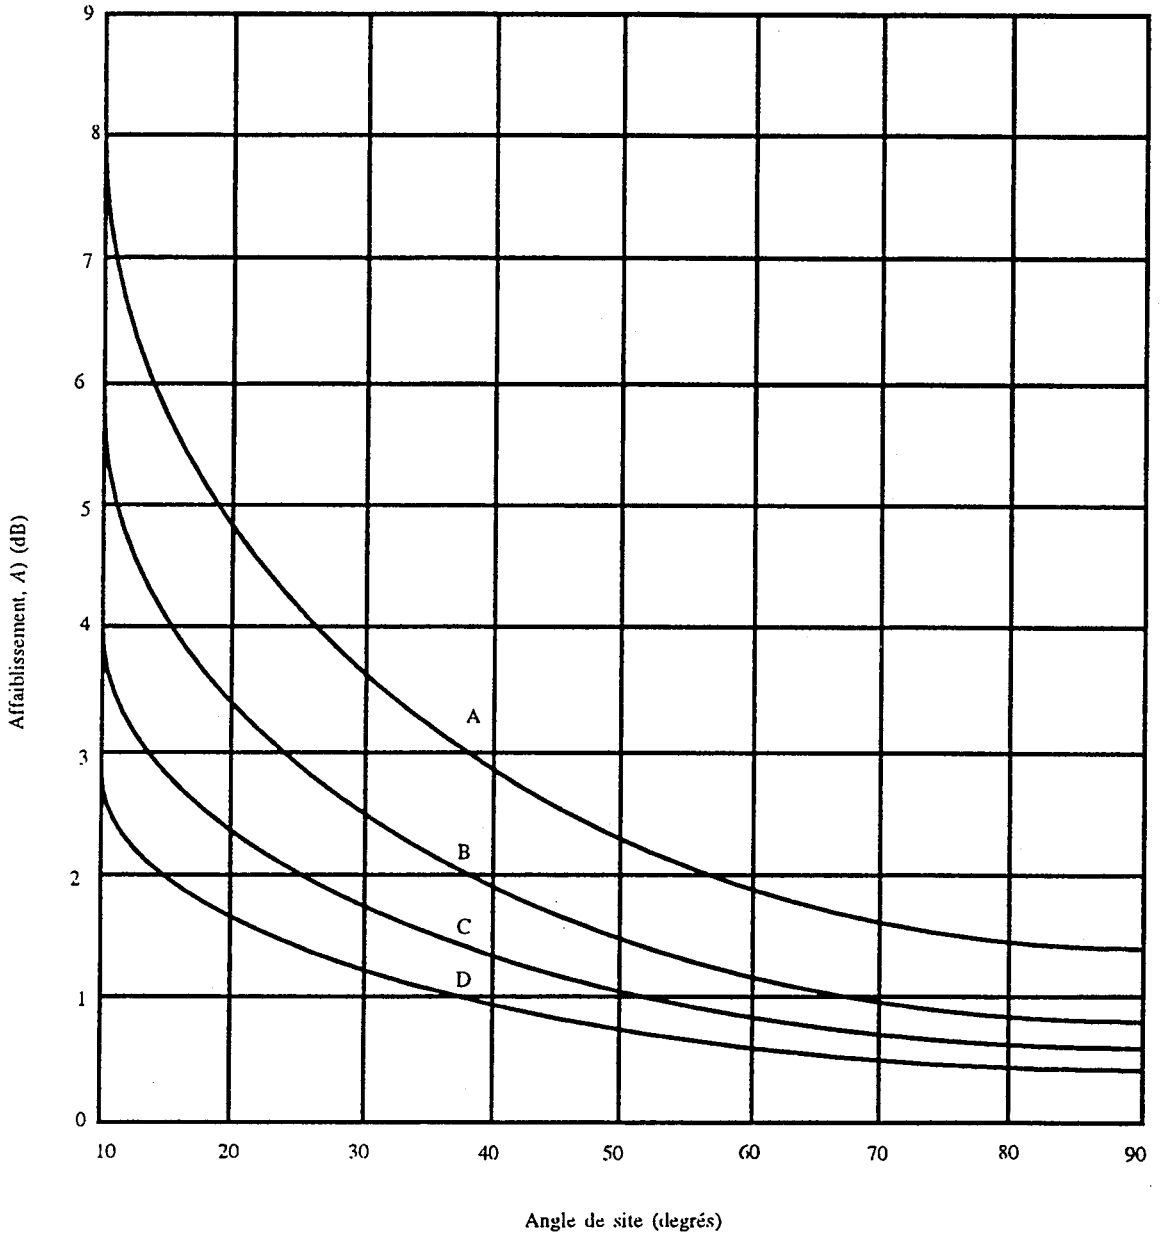

Figure 1 — Valeurs prévues de l'affaiblissement supplémentaire dépassé pendant au plus 1 % du moins le plus défavorable (0,25 % du temps) à 12 GHz dans les zones hydrométéorologiques mentionnées dans la figure 2

A — Zone hydrométéorologique 1
B — Zone hydrométéorologique 2
C — Zone hydrométéorologique 3 et 4
D — Zone hydrométéorologique 5

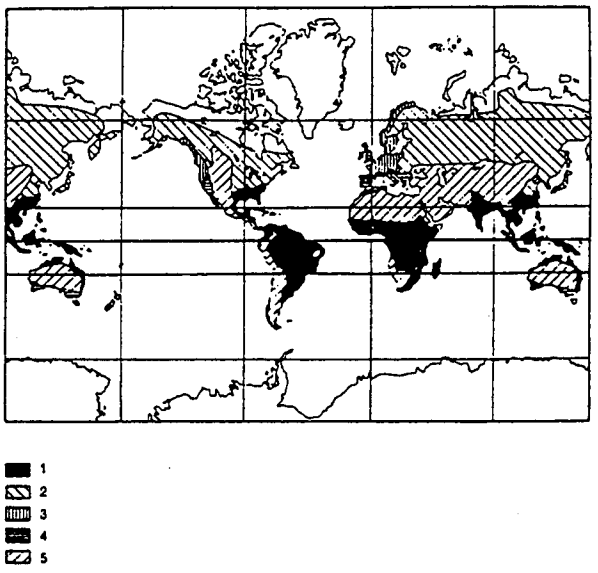

Figure 2 — Zones hydrométéorologiques

Il est à noter que l'on n'a pas fait beaucoup de mesures de l'affaiblissement dû aux précipitations dans les pays tropicaux, en particulier dans la région africaine.

3. *Caractéristiques techniques fondamentales.*

3.1. *Type de modulation.*

La planification du service de radiodiffusion par satellite est fondée sur l'utilisation d'un signal que se compose d'un signal vidéo associé à une voie son modulée en fréquence: l'ensemble module em fréquence une porteuse dans la bande des 12 GHz; la caractéristique de préaccentuation est confome à la fig. 3, laquelle provient de l'Avis 405 du CCIR.

Cela n'interdit pas l'utilisation de signaux modulantes de caractéristiques différentes (par example, une modulation constituée de voies son multiplexées en fréquence dans la bande du canal de télévision, la modulation numérique de signaux sonores et de télévision ou encore l'utilisation de caractéristiques différentes de préaccentuation), à condition que l'utilisation de ces autres caractéristiques ne cause pas un brouillage plus important que celui qu'apporte le système considéré dans la Plan.

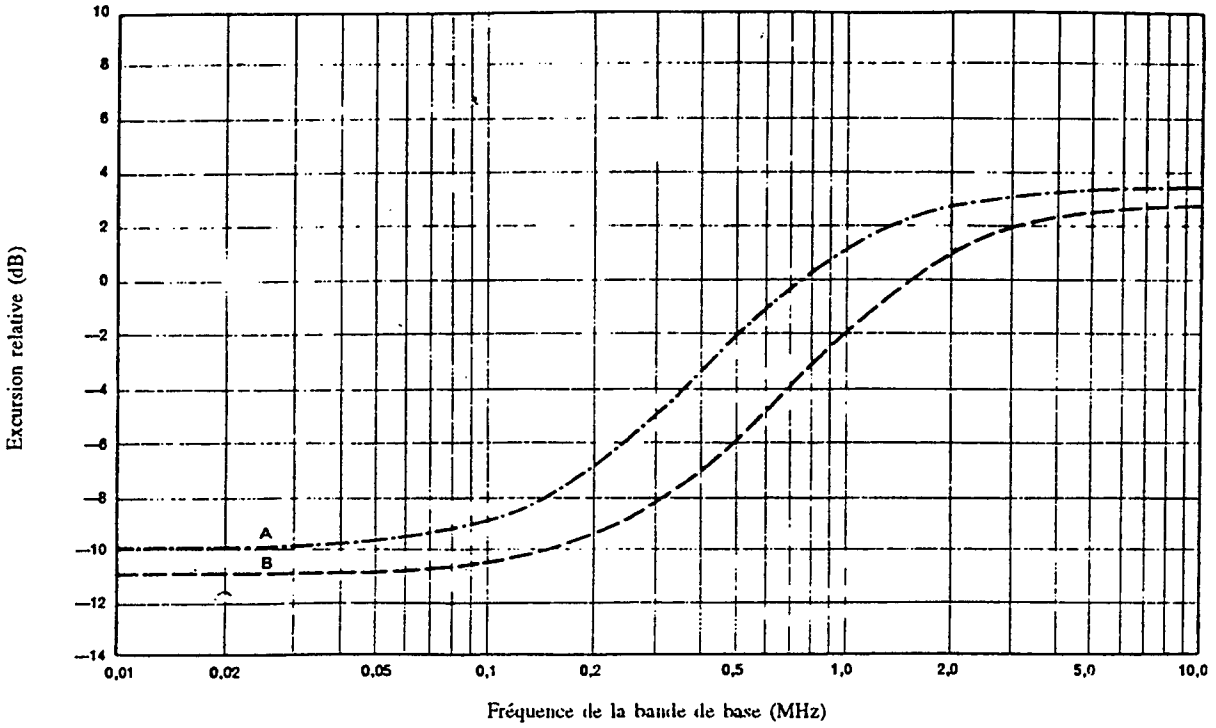

Figure 3 — Caractéristiques de préaccentuation pour les systèmes de télévision à 525 et 625 lignes.

Courbe A: système à 525 lignes.
Courbe B: système à 625 lignes.

3.2. *Polarisation.*

3.2.1. Pour la planification du service de radiodiffusion par satellite, la polarisation circulaire soit être utilisée dans les Régions 1, 2 et 3 (1).

3.2.2. La polarisation des émissions correpondant à des faisceaux différents, conçus à dessein pour desservir la même zone, devrait si possible être la même.

3.2.3. Les termes «direct» et «indirect» utilisés dans un Plan pour indiquer le sens de rotation des ondes polarisées circulairement correspondent à une polarisation dextrogyre (dans le sens des aiguilles d'une montre) ou lévogyre (dans le sens inverse des aiguilles d'une montre) selon les définitions suivantes:

Sens direct ou dextrogyre (sens des aiguilles d'une montre):

Onde (électramagnétique) polarisée elliptiquement, ou circulariement, dont, pour un observateur regardant dans le sens de la propagation, le vecteur champ électrique tourne en *fonction du temps,* dans un *plan fixe* quelconque normal à la direction de propagation, dans le sens *dextrorsum,* c'est-à-dire dans le sens des aiguilles d'une montre.

Note.— Dans le cas d'ondes planes polarisées circulariement dextrorsum, les extrémités des vecteurs attachés aux différents points d'une droite quelconque normale aux plans constituant les surfaces d'ondes forment, à un *instant donnée* quelconque, une hélice *sinistrorsum.*

Sens indirect ou lévogyre (sens inverse des aiguilles d'une montre):

Onde (électromagnétique) polarisée elliptiquement, ou circulairement, dont, pour un observateur regardant dans le sens de la propagation, le vecteur champ électrique tourne en *fonction du temps,* dans un *plan fixe* quelconque normal à la direction de propagation, dans le sens *sinistrorsum,* c'est-à-dire dans le sens contraire à celui des aiguilles d'une montre.

Note.— Dans le cas d'ondes planes polarisées circulairement, sinistrorsum, les extrémités des vecteurs attachés aux différents points d'ue montre quelconque normale aux plans constituant les surfaces d'ondes forment, à un *instant donnée* quelconque, une hélice *dextrorsum.*

3.3. *Raport porteuse/bruit.*

Pour la planification du service de radiodiffusion par satellite, le rapport porteuse/bruit est égal à 14 dB pendant 99 % du mois le plus défavorable.

On considère que la diminution de la qualité sur le trajet descendant due au bruit thermique sur le trajet montant équivaut à une dégradation du rapport porteuse/bruit ne dépassant pas 0,5 dB pendant 99 % du mois le plus défavorable.

3.4. *Rapport de protection entre deux signaux de télévision modulés en fréquence.*

Pour la planification dans les Régions 1 et 3 on a adopté les valeurs suivantes du rappport de protection pour le calcul des marges de protection équivalentes (2):

— 31 dB entre émissions d'un même canal;
— 15 dB entre émissions de canaux adjacents.

3.5. *Espacement entre canaux.*

3.5.1. *Espacement entre canaux du Plan.*

L'espacement entre les fréquences assignées de deux canaux adjacents est de 19,18 MHz. La Plan contient l'indication de la fréquence assignée à chaque canal.

---

(1) L'administration des États-Unis d'Amérique a exprimé son souci quant à l'adoption de la polarisation circulaire pour la Région 2, et a indiqué que l'adoption très probable de la polarisation rectiligne par le service fixe par satellite empêchera l'emploi du croisement de polarisation pour faciliter le partage entre les deux services et aura des répercussions sur l'utilisation de l'orbite et du spectre dans le Région.

L'administration de l'Iran a formulé des réserves quant à l'adoption de la polarisation circulaire pour la planification du service de radiodiffusion par satellite dans le Région 3; elle a précisé qu'elle avait l'intention de mettre en œuvre une polarisation rectiligne.

(2) La marge de protection équivalente, M, et donnée, en dB, par la formule:

$$M = -10 \log [10^{-M_1/10} + 10^{-M_2/10} - 10^{-M_3/10}]$$

où M_1 est la valeur, en dB, de la marge de protection pour le même canal. Elle est définie par l'expression suivante, ou les puissances sont évaluées à l'entrée du récepteur:

$$\frac{\text{puissance utile}}{\text{somme des puissances de brouillage dans le même canal}} \text{ (dB)} — \text{rapport de protection dans le même canal (dB)}$$

M_2 et M_3 sont les valeur, en dB, des marges de protection pour le canal adjacent inférieur et pour le canal adjacent supérieur.

La définition de la marge de protection dans la canal adjacent la même que celle du même canal, bien que l'on fasse intervenir d'une part le rapport de protection dans le canal adjacent et d'autre part la somme des brouillages dus aux émissions dans le canal adjacent.

3.5.2. *Groupement des canaux d'un même faisceau.*

La planification dans la Région 1 a été effectuée en s'efforçant de grouper tous les canaux d'um même faisceau d'antenne, dans une bande de fréquences de 400 MHz, afin de faciliter la construction des récepteurs.

3.5.3. *Espacement des fréquences assignées de canaux utilisés avec une même antenne.*

En raison de difficultés techniques dans le circuit de sortie de l'émetteur d'un satellite, l'espacement entre les fréquences assignées de deux canaux utilisés avec une même antenne doit être supérieur à 40 MHz.

3.6. *Facteur de qualité (G/T) d'une installation de réception de service de radiodiffusion par satellite.*

Pour la planification du service de radiodiffusion par satellite, on utilise une valeur du facteur de qualité *G/T*, de:

60 dB/K pour la réception individuelle;
14 dB/K pour la réception communautaire.

Ces valeurs sont calculées d'aprés la formule suivant qui inclut les erreurs de pointange, les effets de polarisation et le vieillissement des équipements:

$$G/T = \frac{\alpha \beta G_r}{\alpha T_a + (1 - \alpha) T_0 + (n - 1) T_0}$$

dans laquelle on a défini

α — total des pertes de couplage, exprimé en rapport de puissance;
β — total des pertes dues à l'erreur de pointage, aux effects de polarisation et au vieillissement, exprimé en rapport de puissance;
G_r — gain effectif de l'antenne de réception, exprimé en rapport de puissance et tenat compte du type d'illumination et du rendement;
T_a — température effective d'antenne;
T_o — température de référence = 290 K;
n — facteur de bruit global du récepteur, exprimé en rapport de puissance.

Voir aussi Rapport 473-1 (annexe 1) du CCIR.

3.7. *Antennes de rèception.*

3.7.1. *Diamètre minimal des antennes de réception.*

Pour la planification du service de radiodiffusion par satellite on consideré que le diamètre minimal des antennes de réception doit être tel que l'ouverture du faisceau à demi-puissance, φ_o, est:

a) Pour la réception individuelle: de 2° dans les Régions 1 et 3, de 1,8° dans la Région 2;
b) Pour la réception communautaire: de 1° dans toute les Régions.

3.7.2. *Diagrammes de référence des antennes de réception.*

Les diagrammes de références copolaire et contrapolaire des antennes de réception sont donnés dans les figures 4 et 5.

a) Le gain relatif de l'antenne, exprimé en dB, est donné par les courbes de la figure 4 dans le cas de:

La réception individuelle dans les Régions 1 et 3, pour laquelle il convient d'utiliser:

Pour la composante copolaire, la courbe A;
Pour la composante contrapolaire, la courbe B;

La réception communautaire, pour laquelle il convient d'utiliser:

Dans toutes les Régions, pour la composante copolaire, la courbe A', jusqu'à l'intersection avec la courbe C, puis, la courbe C;
Dans les Régions 1 et 3, pour la composante contrapolaire, la courbe B;

b) Pour la Région 2, le gain relatif de l'antenne, exprimé en dB, est donné par les courbes de la figure 5 dans le cas de:

La réception individuelle, pour laquelle il convient d'utiliser:

Pour la composante copolaire, la courbe A;
Pour la composante contrapolaire, la courbe B;

La réception communautaire, pour laquelle il convient d'utiliser, pour la composante contrapolaire, la courbe B (la composante copolaire étant donnée à la figure 4).

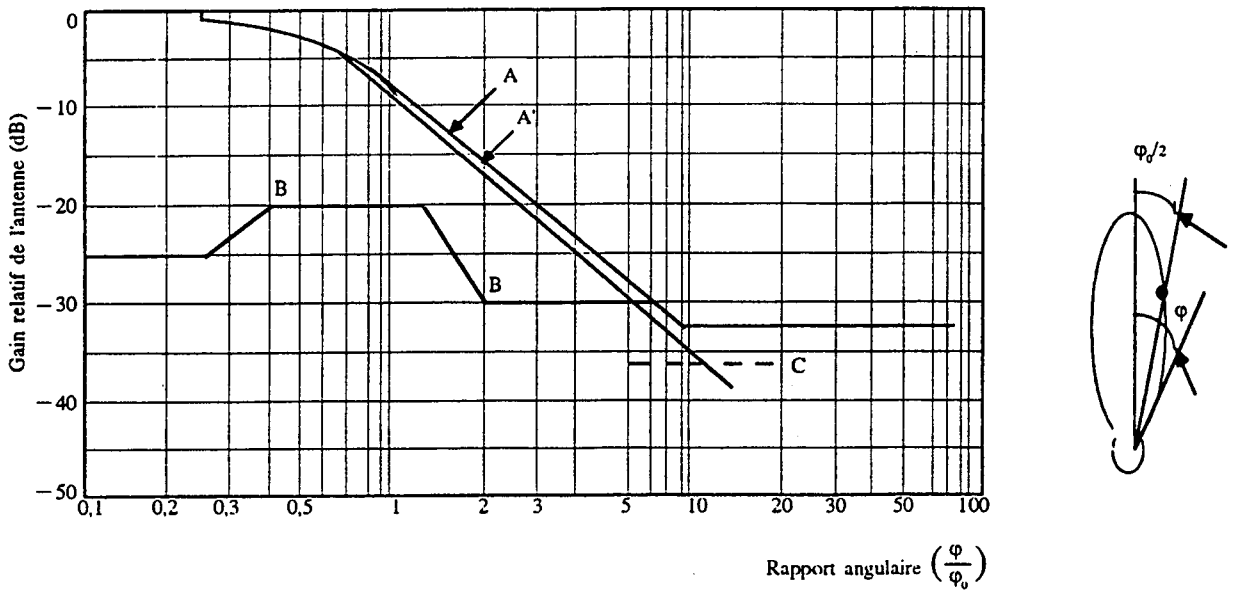

Figure 4. — Diagrammes de référence copolaire et contrapolaire de l'antenne de réception

Courbe A — Composante copolaire pour la réception individuelle sans suppression des lobes latéraux:

0 pour $0 \leq \varphi \leq 0{,}25\ \varphi_0$;

— $12 \left(\frac{\varphi}{\varphi_0}\right)^2$ pour $0{,}25\ \varphi_0 < \varphi \leq 0{,}707\ \varphi_0$;

— $\left[9{,}0 + 20 \log_{10} \left(\frac{\varphi}{\varphi_0}\right)\right]$ pour $0{,}707\ \varphi_0 < \varphi \leq 1{,}26\ \varphi_0$;

— $\left[8{,}5 + 20 \log_{10} \left(\frac{\varphi}{\varphi_0}\right)\right]$ pour $1{,}26\ \varphi_0 < \varphi \leq 9{,}55\ \varphi_0$;

— 33 pour $9{,}55\ \varphi_0 < \varphi$.

Courbe A — Composante copolaire pour la réception communautaire sans suppression des lobes latéraux:

0 pour $0 \leq \varphi \leq 0{,}25\ \varphi_0$;

— $12 \left(\frac{\varphi}{\varphi_0}\right)^2$ pour $0{,}25\ \varphi_0 < \varphi \leq 0{,}86\ \varphi_0$;

— $\left[10{,}5 + 25 \log_{10} \left(\frac{\varphi}{\varphi_0}\right)\right]$ pour $0{,}86\ \varphi_0 < \varphi$; jusqu'à l'intersection avec la courbe C (ensuite prendre la courbe C).

Courbe B — Composante contrapolaire pour les deux types de réception:

— 25 pour $0 \leq \varphi \leq 0{,}25\ \varphi_0$;

— $\left(30 + 40 \log_{10} \left|\frac{\varphi}{\varphi_0} - 1\right|\right)$ pour $0{,}25\ \varphi_0 < \varphi \leq 0{,}44\ \varphi_0$;

— 20 pour $0{,}44\ \varphi_0 < \varphi \leq 1{,}4\ \varphi_0$;

— $\left(30 + 25 \log_{10} \left|\frac{\varphi}{\varphi_0} - 1\right|\right)$ pour $1{,}4\ \varphi_0 < \varphi \leq 2\ \varphi_0$;

— 30 jusqu'à l'intersection avec la courbe de la composante copolaire (ensuite prendre la courbe de la composante copolaire).

Courbe C — Opposé algébrique du gain sur l'axe du faisceau principal.

Note. — Les valeurs de φ_0 sont indiqueés au paragraphe 3.7.1.

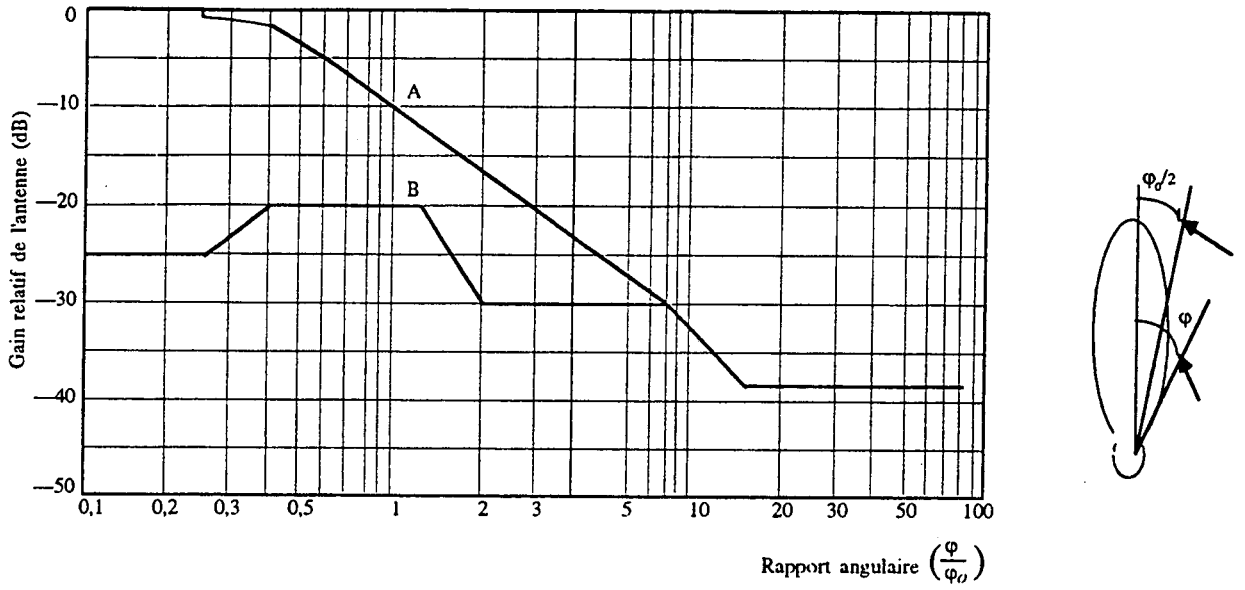

Figure 5 — Diagrammes de référence copolaire et contrapolaire de l'antenne pour réception individuelle dans la Région 2

Courbe A — Composante copolaire sans suppression des lobes latéraux:

0 pour $0 \le \varphi \le 0{,}25\ \varphi_0$;

— $12 \left(\frac{\varphi}{\varphi_0}\right)^2$ pour $0{,}25\ \varphi_o < \varphi \le 0{,}707\ \varphi_o$;

— $\left[9{,}0 + 20 \log_{10} \left(\frac{\varphi}{\varphi_o}\right)\right]$ pour $0{,}707\ \varphi_o < \varphi \le 1{,}26\ \varphi_o$;

— $\left[8{,}5 + 25 \log_{10} \left(\frac{\varphi}{\varphi_o}\right)\right]$ pour $1{,}26\ \varphi_o < \varphi \le 15{,}14\ \varphi_o$;

— 38 dB pour $\varphi > 15{,}14\ \varphi_o$.

Courbe B — Composante contrapolaire:

— 25 pour $0 \le \varphi \le 0{,}25\ \varphi_o$;

— $\left(30 - 40 \log_{10} \left|\frac{\varphi}{\varphi_o} - 1\right|\right)$ pour $0{,}25\ \varphi_o < \varphi \le 0{,}44\ \varphi_o$;

— 20 pour $0{,}44\ \varphi_o < \varphi_o \le 1{,}4\ \varphi_o$;

— $\left(30 - 25 \log_{10} \left|\frac{\varphi}{\varphi_o} - 1\right|\right)$ pour $1{,}4\ \varphi_o < \varphi \le 2\ \varphi_o$;

— 30 jusqu'à l'intersection avec la courbe de la composante copolaire (ensuite prendre la courbe de la composante copolaire).

Note. — Les valeurs de φ_o sont indiquées en 3.7.1.

3.8. *Largeur de bande nécessaire:*

Les largeurs de bande nécessaires à prendre en considération sont:

Pour les systèmes à 625 lignes: 27 MHz;
Pour les systèmes à 525 lignes en Région 3: 27 MHz;
Pour le système M à 525 lignes de la Région 2: 18 et 23 MHz.

3.9. *Bandes de garde.*

3.9.1. On entendent par bande de garde la portion du spectre radioèlectrique comprise entre la limite de la bande attribuée et la limite de la bande nécessaire à l'émission dans le canal le plus proche.

3.9.2. Pour la planification du service de radiodiffusion par satellite, les bandes de garde nécessaires pour proteger les services assurés dans les bandes adjacents sont indiquées dans le tableau ci-dessous.

Régions	Bande de garde à la limite inférieure de la bande (11,7 GHz)	Bande de garde à la limite supérieure de la bande (12,2–12,5 GHz)
1	14 MHz	11 MHz
2	12 MHz	9 MHz
3	14 MHz	11 MHz

Ces bandes de garde ont été calculées sur la base d'une valeur de 67 dBW dans le cas des Régions 1 et 3 d'une valeur de 63 dBW dans le cas de Région 2, pour la p. i. r. e. maximale au centre du faisceau et pour un affaiblissement de filtre de 2 dB/MHz; ces valeurs se rapportent à la réception individuelle. Si l'on admet de plus faibles valeurs des p. i. r. e, les bandes de garde pourront être réduites de 0,5 MHz par décibel de diminution de ces p. i. r. e.

3.9.3. Il est probable que les progrés de la technique ou l'adoption de p. i. r. e plus faibles que les p. i. r. e. indiquées ci-dessous permettront de réduire les bandes de garde nécessaires. Aussi est-il recommande, à toute autre fin que la planification par la Conférence (1), de se conformer aux plus récents Avis du CCIR relatifs aux rayonnements non essentiels des satellites de radiodiffusion.

3.10. *Espacement sur l'orbite.*

Le Plan pour les Régions 1 et 3 a été établi en espaçant en règle générale de 6° les positions nominales sur l'orbite.

3.11. *Maintien de la position du satellite.*

Les stations spatiales du service de radiodiffusion par satellite doivent être maintenues en position avec une précision meilleure que ± 0,1°, tant dans la direction Nord-Sud que dans la direction Est-Ouest. (Ces tolérances conduisent à un écart maximal de ± 0,14° du satellite par rapport à sa position nominale).

3.12. *Angle de site des antennes de réception.*

Le Plan a été établi en considérant un angle de site d'au moins 20° pour réduire le plus possible la p. i. r. e. du satellite, prévenir les effets d'écran et diminuer les possiblités de brouillages dus aux services de Terre. Toutefois, dans les zones situées á des latitudes supérieures à 60° environ, l'angle de site est nécessairement inférieur à 20° (voir aussi paragraphe 2.2).

Dans les zones montagneuses où un angle de site de 20° peut être insuffisant, on a tenu compte autant que possible d'un angle de site minimal de 30° pour assurer un service de qualité acceptable. Un angle de site d'au moins 40° a été considéré pour des zones de services où se produisent de fortes précipitations (par exemple la zone hydrométéorologique 1).

Dans certaines zones sèches et nom montagneuses, un service de qualité acceptable pourrait être obtenu avec des angles de site inférieures à 20°.

Dans les zones à faibles angles de site, il peut être nécessaire de tenir compte d'un effet d'écran dû à des bâtiments très élevés.

En choisissant une position de satellite telle que l'angle de site soit maximal au sol, il a été tenu compte de la période d'éclipse correspondant á cette position.

3.13. *Antennes d'emission.*

3.13.1. *Section du faisceau de l'antenne d'émission.*

La planification a été fondée sur l'utilisation d'antennes d'émission à faisceau de section elliptique ou circulaire.

Si la section droite du faisceau émis est elliptique, l'ouverture φ_0 à prendre en considération est fonction de l'angle de rotation, q, entre le plan passant par le satellite et contenant le grand axe de la section droite du faisceau et le plan dans lequel l'ouverture de l'antenne est considérée.

On peut calculer la relation existant entre le gain maximal d'une antenne et l'ouverture à mis-puissance à partir de l'expression:

$$G_m = 27\,843/ab$$

ou

$$G_m\ (\text{dB}) = 44{,}44 - 10\ \log_{10}\ a - \log_{10} b$$

dans laquelle a et b sont respectivement les anglés (en degrés) sous lesquels sont vus du satellite le grand axe et le petit axe de la trace elliptique de la section droite du faisceau.

On admet que le rendement de l'antenne est de 55 %.

---

(1) Conference administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

3.13.2. *Ouverture minimale de l'antenne d'emission.*

Pour la planification on a admis que la valuer minimale actuellement réalisable de l'ouverture à demi-puissance est de 0,6°.

3.13.3. *Diagrammes de référence de l'antenne d'emission.*

Les diagrammes de référence copolaire et contrapolaire des antennes d'emission des stations spatiales utiliseés pour l'établissement du Plan sont reproduits à la figure 6.

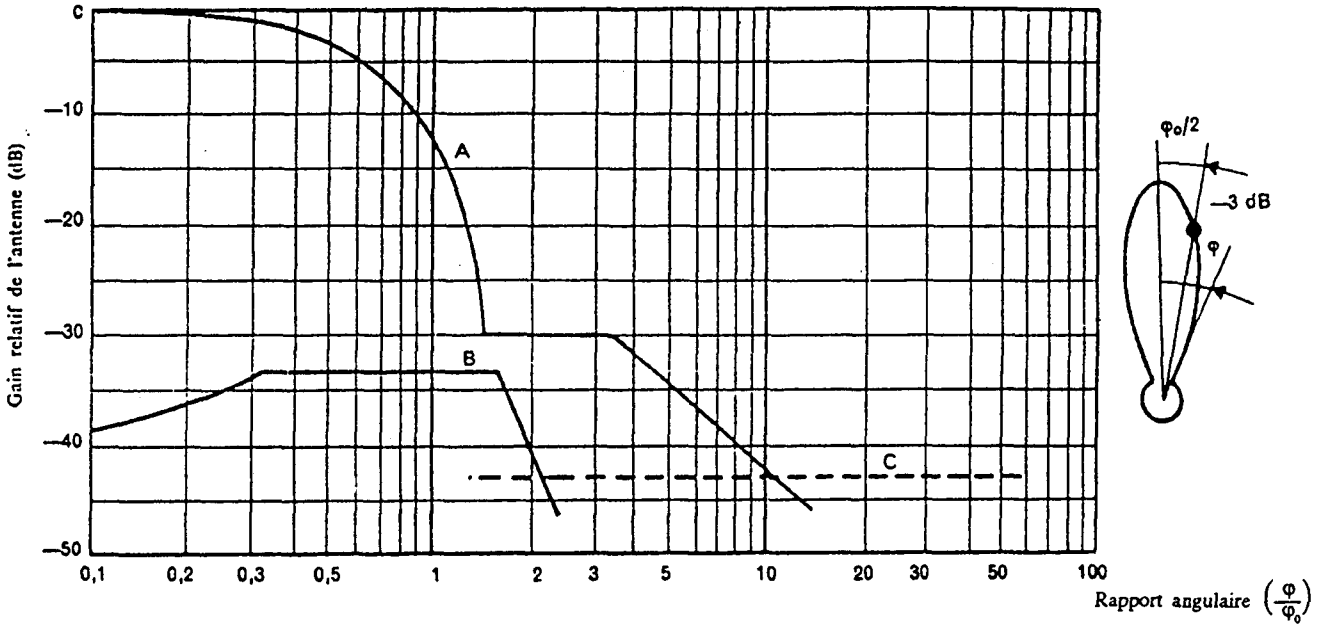

Figure 6 — Diagrammes de référence copolaire et contrapolaire de l'antenne d'emission du satellite

Courbe A — Composante copolaire:

— $12\left(\frac{\varphi}{\varphi_0}\right)^2$ pour $0 \leq \varphi \leq 1{,}58\ \varphi_0$;

— 30 pour $1{,}58\ \varphi_0 < \varphi \leq 3{,}16\ \varphi_0$;

— $\left[17{,}5 + 25\log_{10}\left(\frac{\varphi}{\varphi_0}\right)^2\right]$ pour $3{,}16\ \varphi_0 < \varphi$, après l'intersection avec la courbe C: comme la courbe C.

Courbe B — Composante contrapolaire:

— $\left(40 + 40\log_{10}\left|\frac{\varphi}{\varphi_0} - 1\right|\right)$ pour $0 \leq \varphi \leq 0{,}33\ \varphi_0$;

— 33 pour $0{,}33\ \varphi_0 < \varphi \leq 0{,}33\varphi_0$;

— $\left(40 + 40\log_{10}\left|\frac{\varphi}{\varphi_0} - 1\right|\right)$ pour $1{,}67\ \varphi_0 < \varphi_0$ après l'intersection avec la courbe C; comme la courbe C.

Courbe C — Opposé algébrique du gain sur l'axe du faisceau principal.

3.14. *Précision de pointage des antennes de satellite.*

3.14.1. L'écart du faisceau de l'antenne par rapport à sa direction de pointage nominale ne doit pas dépasser une valeur de 0,1° dans toutes les directions. En outre, la rotation angulaire d'un faisceau d'emission autour de son axe ne doit pas dépasser une valeur de ± 2°; il ln'est pas nécessaire d'indiquer cette limite pour les faisceaux à section circulaire utilisant la polarisation circulaire.

3.14.2. La zone couverte à la surface de la Terre par le faisceau du satellite subit d'autres déplacements dus aux facteures suivants:

Imperfections du maintien en position du satellite;

Effet plus prononcé des variations dues aus tolérances de pointage mentionnées ci-dessus, dans les zones de couvertures associées è de faibles angles de site;

Augmentation de l'importance de l'erreur sur l'axe de lacet au fur et à mesure que l'ellipse du faisceau devient plus allongée.

3.14.3. Il convient d'evaluer cas par cas l'effet de ces variations éventuelles, car leur influence globale sur la zone couverte dépende du changement de la géométrie du faisceau du satellite et il serait déraissonnable de spécifier pour toutes les situations une valeur unique du déplacement de la zone couverte.

3.14.4. Dans le cas d'une émission un polarisation rectiligne, l'erreur sur l'axe de lacet contribue de mainére significative à intensifier la composante émise en polarisation croisée, ce qui entraîne l'augmentation du brouillage avec les autres porteuses initialement en polarisation coirsée avec émission.

3.15. *Limitation de la puissance de sortie de l'émetteur du satellite.*

La puissance de sortie d'un station spatiale du service de radiodiffusion par satellite ne doit pas dépasser sa valeur nominale de plus de 0,25 dB pendant toute la durée d'utilisation du satellite.

3.16. *Puissance surfacique à la limite de la zone de couverture.*

La valuer de la puissance surfacique à la limite de la zone de couverture, pendant 99 % du mois le plus défavorable est de:

— 103 dB(W/m²) pour la réception individuelle dans les Régions 1 et 3;
— 105 dB(W/m²) pour la réception individuelle dans la Région 2;
— 111 dB(W/m²) pour la réception communautaire dans toutes les Régions.

3.17. *Différence entre la p. i. r. e. dirigée vers la limite de la zone de couverture et la p. i. r. e. sur l'axe du faisceau.*

Pour la planification, on considère que la valuer absolue de la différence entre la p. i. r. e. dirigée vers la limite de la zone de couverture et la p. i. r. e. sur l'axe du faisceau doit, de préférence, être de 3 dB.

Si l'empreinte du faisceau est supérieure à la zone de couverture, cette valeur devient inférieure à 3 dB.

3.18. *Utilisation de la dispersion de l'énergie .*

Pour la planification, on adopte une valuer de la dispersion d'énergie qui réduit de 22 dB la densité spectrale de puissance surfacique mesurée dans une bande de 4 kHz par rapport à cette densité mesurée dans toute la bande; cette réduction correspond à une excursion crête-à-crête de 600 kHz.

ANNEXE 9

Critères de partage entre services

1. *Caractéristiques de protection pour le partage entre services utilisant la bande des 12 GHz.*

1.1. La détermination des critères de partage entre les différents services utilisant la bande des 12 GHz doit être fondée sur les caractéristiques de protection spécifiées dans le tableau ci-dessous.

Service utile (*a*)	Signal utile (*a*)	Service brouilleur (*a*)	Signal brouilleur (*a*)	Caractéristiques de protection (*b*)	
				Valeur acceptable du brouillage par plusieurs niveaux (*c*)	Valeur pour une contribution unique de brouillage
SRS	TV/MF	SRS, SFS, SF, SR	TV/MF	*C/I* = 30 dB (*d*) (*g*)	*C/I* = 35 dB (*d*)
SFS	MRF/MF	SRS	TV/MF	*N* = 500 pW0p (*h*)	*N* = 300 pW0p
SFS	TV/MF	SRS, SFS	TV/MF	*C/I* = 32 dB (*e*)	*C/I* = 37 dB (*e*)
SFS	4 φ-MDP	SRS, SFS	TV/MF	*C/I* = 30 dB	*C/I* = 35 dB
SFS	MRF/MF	SFS	MRF/MF	*N* = 1000 pW0p	*N* = 400 pW0p
SF	MRF/MF	SRS	TV/MF	*N* = 1000 pW0p	—125 db (W/m²/4 kHz (*f*)
SR	TV/BLR	SRS	TV/MF	*C/I* = 50 dB	Sans object

(*a*) SRS = service de radiodiffusion par satellite; SFS = service fixe par satellite; SR = service de radiodiffusion; SF = service fixe; TV = télévision; MF = modulation de fréquence; MRF = multiplexage par répartition en fréquence; 4φ.MDP = modulation par déplacement de phase à quatre états; BLR = bande latérale résiduelle.

(*b*) Ces limites couvrent à la fois la contribution du trajet montant et la contribution du trajet descendant et la contribution du trajet descendant. Elles sont exprimées selon le cas:

En dB lorsqu'il s'agit du rapport porteuse/brouillage;
En pW0p lorsqu'il s'agit du bruit;
En dB(W/m²/4 kHz) lorsqu'il s'agit de la puissance surfacique dans une bande de 4 kHz.

(*c*) Les valeurs exprimées en dB sont celles des rapportes de protection pour l'ensemble des signaux brouilleurs. Les valeurs exprimées en pW0p sont celles du bruit observé dans la voir téléphonique la plus défavorisée résultant de l'ensemble des signaux brouilleurs.

(*d*) Pour les satellites de radiodiffusion situés aux limites de la Région 2 avec la Région 1 ou la Région 3, les rapports *C/I* doivent être augmentés de 1 dB.

(*e*) Voir l'Avis 483 du CCIR.

(*f*) Cette valeur peut être convenablement modifiée pour les régions tropicales, pour tenir compte de l'affaiblissement dû aux précipitations. La discrimination de polarisation peut être également prise en considération.

(*g*) *C/I* = rapporte de la puissance du signal utile à la puissance du signal brouilleur.

(*h*) *N* = puissance de bruit.

1.2. Les valeurs indiquées comme acceptables sont les valeurs nécessaires pour protéger le signal utile. Les valeurs indiquées pour une contribution unique de brouillage sont celles qu'il convient d'utiliser à titre indicatif pour fixer les critéres de partage. Il est nécessaire de calculer le brouillage total dû à l'ensemble des brouilleurs; en effet, en respectant pour chaque source les critères applicables à une contribution unique de brouillage, on ne garantit pas forcément que le brouillage total répondra aux caractéristiques de protection indiquées ci-dessus. Une contribution unique de brouillage est dèfine commer ètant l'ensemble des emissions d'une station qui entrent dans le récepteur du service utile dans le canal à protéger.

1.3. Le rapport porteuse/brouillage (*C/I*) est le rapport de la puissance du signal utile à la puissance du signal brouilleur, à l'entrée du récepteur, au sol, qui subit le brouillage. Pour le service fixe par satellite, la valeur indiquée doit être toujours dépassée, sauf pendant 20 % du mois le plus défavorable; pour le service de radiodiffusion et le service de radiodiffusion par satellite, le pourcentage correspondant est de 1 %.

1.4. Le symbole *N* désigne la puissance de bruit aprés démodulation en un point de niveau relatif 0 dBm0 de la tonalité de mesure dans une voie téléphonique quelconque d'un système téléphonique MRF/MF. La valeur indiquée ne doit pas être dépassé pendant plus de 20 % du mois le plus défavorable.

1.5. Les valeurs spécifiées pour le rapport de protection (c'est-à-dire le rapport de puissance porteuse/brouillage correspondant à une qualité d'image donnée) sont applicables, pour la planfication, aux signaux, de télévision, quelle que soit la norme utilisée.

1.6. Pour les systèmes du service de radiodiffusion par satellite dans lesquels le signal utile est un signal de télévision modulé en fréquence, les rapports de protection sont donnés pour des conditions de réference particulières dont les plus importantes sont:

a) Excursion de fréquence du signal utile (12 MHz crête-à-crête);
b) Qualité du service utile (niveau 4,5) (1);
c) Porteuse dans le même canal ou dans la même voie (pas de décalage des fréquences porteuses).

1.7. Si la conception du système est fondée sur des conditions autres que les conditions *a*) et *b*) ci-dessus, le rapport de protection du signal de télévision modulé en fréquence est donné par la formule:

$$R = 12{,}5 - 20 \log (D_v/12) - Q + 1{,}1\ Q^2 \text{ (dB)}$$

dans laquelle

D_v est l'excurtion de fréquence nominale crête-à-crête (MHz);
Q est le niveau de dégradation pour les brouillages seulement.

1.8. Lorsque les porteuses sont décalées en fréquence, la condition *c*) ne peut s'appliquer; les rapports de protection du canal adjacent doivent être ajustés en fonction du décalage de fréquence comme indiqué dans la figure 1. Par exemple, pour un décalege de 20 MHz, la valeur totale acceptable du rapport de protection contre les brouillages causès à un signal de télévision modulé en fréquence par un autre du même type est de 13 dB; la valeur correspondante pour une contribution unique de brouillage est de 18 dB.

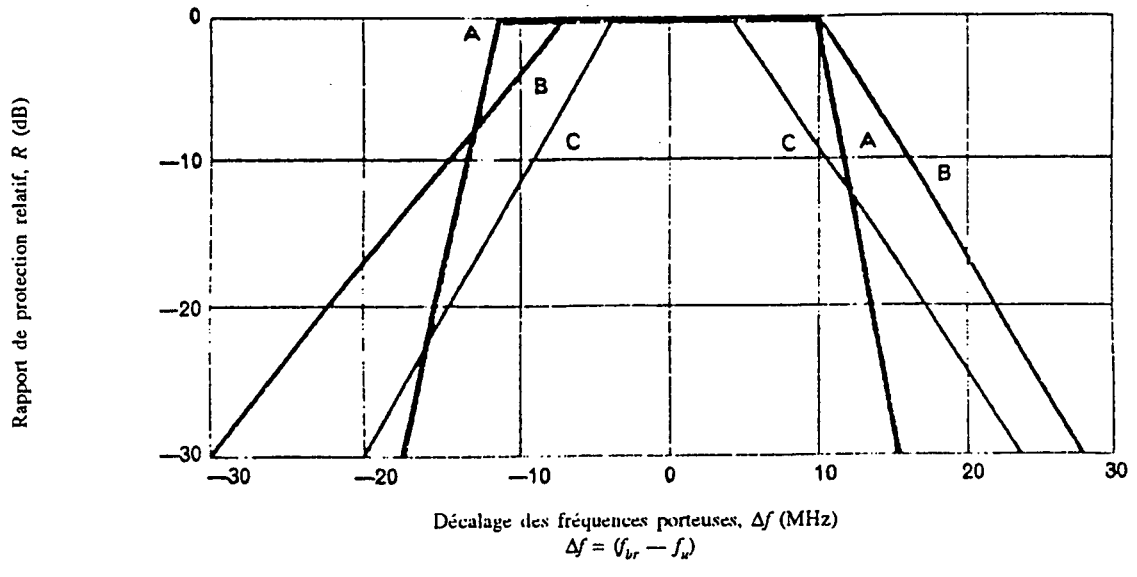

Figure 1 — Rapport de protection dans les conditions de reférence en fonction du décalage en fréquence

Courbe A — Pour un signal utile TV/BLR et un signal brouilleur TV/MF.
Courbe B — Pour un signal utile TV/MF et un signal brouilleur TV/MF.
Courbe C — Pour un signal utile TV/MF et un signal brouilleur TV/BLR.

(1) D'aprés l'échelle d'évaluation à 5 notes, définie dans l'Avis 500 du CCIR.

2. *Diamètre d'antenne de référence pour une station terrienne du service fixe par satellite, à utiliser pour le calcul des brouillages causés par les stations du service de radiodiffusion par satelitte.*

2.1. Pour une antenne de diamètre supérieur à 100 λ (2,5m), dans le service fixe par satellite, le gain des lobes latéraux est donné par la formule: 32 — 25 log θ, dans laquelle θ représent l'angle de visée (Avis 465 du CCIR). Il est de plus indépendant du diamètre de l'antenne.

2.2. Toutefois, en ce qui concerne les stations terriennes d'émission, le niveau de brouillage affectant le trajet montant des autres systèmes à satellites est inversement proportionnel au carré du diamètre de l'antenne. Le brouillage décroît donc lorsque le diamètre de l'antenne croit. Toutefois, dans le service fixe par satellite, la bande 11,7-11,2 GHz étant réservée aux émissions dans le sens espace vers Terre, cette question ne corcerne pas directement le service de radiodiffusion par satellite.

2.3. S'agissant des antennes dont le diamètre dépasse 100 λ, il n'y a donc pas lieu, semble-t-il, de fixer un diamétre minimal pour les antennes des stations terriennes de réception du service fixe par satellite dans la bande partagée 11,7-12,2 GHz. Pour le partage de cette bande lors de la planification, une antenne de 4,5 m avec un rendement de 60 % et un gain de 53 dB dans l'axe du faisceau peut être considerée comme usuelle. Toutefois, il convient de noter que les administrations de la Région 2 étudient la possibilité d'utiliser des antennes ayant des diamètres compris entre 3 m et 10 m.

3. *Utilisation de la dispersion de l'énergie dans le service de radiodiffusion par satellite.*

3.1. La dispersion artificielle de l'énergie contribue à faciliter le partage entre le service de radiodiffusion par satellite et les autres services auxquels la bande est également attribuée.

3.2. Cette dispersion de l'énergie s'obtient en ajoutant, dans la bande de base, un signal triangulaire au signal vidéo; il en résulte une bande de base composite qui sert à son tour à moduler en fréquence la porteuse sur le trajet montant. La fréquence du signal triangulaire est généralement synchronisée avec un sous-multiple de la fréquence de trame du signal de télévision; sa valeur est normalement comprise entre 12,5 Hz et 30 Hz.

3.3. Le tableau ci-après indique la rédution relative de la densité spectrale de puissance surfacique dans une bande de 4 kHz en fonction de l'excursion crête-à-crête due au signal de dispersion de l'energie. Les valeurs indiquées dans ce tableau cont été calculées au moyen de la formule:

$$\text{Réduction relative (en dB) dans une bande de 4 kHz} = 10 \log \frac{\Delta F_{cc} + \delta f_{eff}}{4}$$

ΔF_{cc} = excursion crête-à-crête due au signal de dispersion de l'energie (kHz);
δf_{eff} = excursion efficace due à la dispersion «naturelle» de l'énergie (kHz).

Dans l'établissement du tableau ci-après, on a admis pour δf_{eff} une valeur de 40 kHz, compte tenu de ce que la valeur donnée pour la dispersion «naturelle» dans le tableau 4 du project de Rapport 631 (Rév. 76) du CCIR est de 10 dB.

Réduction de la densité spectrale de puissance surfacique dans une bande de 4 kHz

Excursion crête-à-crête (kHz)	Réduction relative (dB)
0	10
100	15,44
200	17,78
300	19,29
400	20,41
500	21,30
600	22,04
700	22,67
800	23,22
900	23,71
1000	24,15

3.4. La valeur de la dispersion de l'energie dans le service de radiodiffusion par satellite a été déterminée de façon à réduire de 22 dB la densité spectrale de puissance surfacique mesurée dans une bande de 4 kHz par rapport à cette densité mesuré dans toute la bande; cette réduction correspond à une excursion crête-à-crête de 600 kHz.

ANNEXE 10

Restrictions aplicables aux positions sur l'orbite

En appliquant le procédure déscrite à l'article 4 pour apporter des modifications au Plan, les administrations doivent respecter les critères énoncés ci-aprés:

1) Aucun satellite de radiodiffusion desservant une zone de la Région 1 en utilisant une fréquence de la bande 11,7-12,2 GHz, ne doit occuper une position nominale sur l'orbite plus occidentale que 37° Ouest ou plus orientale que 146° Est;
2) Toute nouvelle position nominale sur l'orbite introduite dans le Plan dans la partie de l'arc d'orbite comprise entre 37° Ouest et 10° Est, et associée à une nouvelle assignation, ou résultant d'une modification apportée à une assigntion figurant dans le Plan, doit coïncider avec une position nominale sur l'orbitale indiquée dans le Plan à la date d'entrée en vigueur des Actes finals (1), ou se trouver au plus à 1° à l'est de ladite position sur l'orbite.

Dans le cas d'une modification apportée à une assignation figurant dans le Plan, l'utilisation d'une nouvelle position nominale sur l'orbite qui ne coinciderait avec aucune des positions nominales sur l'orbite indiquées dans le Plan à la date d'entrée en vigueur des Actes finals (1) s'accompagnera d'une réduction de p. i. r. e. de 8 dB par rapport à la valeur de la p. i. r. e. inscrite dans le Plan en regard de l'assignation avant la modification de celle-ci.

ANNEXE 11

Méthode de calcul de la puissance surfacique produite sur les territoires de la Région 2 par des stations spatiales du service de radiodiffusion des Régions 1 et 3

Méthode de calcul

1. On peut calcules la puissance surfacique produite par la station spatiale, dans des conditions de propagation en espace libre, en un point donné P situé à la surface de la Terre au moyen des données suivantes:

1.1. Positions nominale sur l'orbite;

1.2. P. i. r. e. (dbW);

1.3. Caractéristiques du faisceau d'antenne à demi-puissance (c'est-à-dire le grande axe et le petit axe ainsi que l'orientation de l'ellipse correspondante);

1.4. Coordonnées géographiques du point de visée (B):

1.5. Coordonnées géographiques du point P.

2. Les valeurs concernant les points 1.1 à 1.4 ci-dessus sont indiquées dans le Plan. Quant au point P, il peut être choisi d'apress l'objectif des calculs. Pour les calculs ci-aprés, les coordonnées géographiques du point P sont 35° Ouest et 8° Sud.

3. Pour obtenir la valuer de la puissance surfacique [(dB(W/m²)] produite au point P, on calcule:

La distance d(m), entre le satellite et le point P;

Le facteur d'étalement A pour la distance d.

$$A = 10 \log \frac{1}{4\pi d^2}$$

L'angle φ, vu depuis le satellite, entre les points B et P;

L'ouverture φ_o, du faisceau à demi-puissance dans la direction de P (dans le cas d'un faisceau circulaire, φ_o est indépendant de la direction);

Le gain d'antenne relatif δG (dB), pour les valeurs calculées de δ et δ_o en utilisant le diagramme de référence copolaire de l'antenne d'émission du satellite.

La puissance surfacique p_s produite au point P, est donnée par l'expression (2):

$$p_s\ [\mathrm{dB(W/m^2)}] = \text{p. i. r. e.} + \delta G + A$$

Résultats

Les puissances surfaciques produites au point de coordonnés 35° Ouest et 8° Sud par les stations de radiodiffusion des Régions 1 et 3, auxquelles ont été assignés dans le Plan les positions nominales sur l'orbite comprises entre 37° Ouest et 5° Est et les canaux 1 à 25, figurent dans le tableau suivant.

---

(1)Actes finals de la Conférence adminsitrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) entrés e vigeur le 1er janvier 1979.

(2) Dans cette expression, la p. i. r. e. se rapport au point de visée. Le gain d'antenne δG est pris par rapport au gain d'antenne dans la direction du point de visée, done δG est négatif.

Densité surfacique de puissance (DSP) produite dans la Région 2, au point: longitude = 35° Ouest, latitude = 8° Sud

Power flux density (PFD) produced in Region 2 at a point having: longitude = 35° W, latitude = 8° S

Densidad de flujo de potencia (DFP) producida en la Región 2 en el punto correspondiente alas siguientes coordenadas: longitud = 35° Oeste, latitud = 8.° Sur

APPENDICE 31

Tableau des fréquences à utiliser das les bandes atribuées en exclusivité au service mobile maritime entre 4 MHz et 27,5 MHz

Dans le tableau, selon de cas, les fréquences à assigner dans une bande déterminée pour chacun des usages considérés:

Sont désignées par la fréquence la plus basse et par la fréquence la plus haute à assigner. Ces deux fréquences sont indiqueés en caractéres gras;

Sont régulièrement espacèes entre elles. Nombre des fréquences à assigner el la valeur de leur espacement, exprimé en kHz, sont précisés para une mention en italique.

Tableau des fréquences à utiliser dans les bandes attribuées

(kHz)

AP 31-7

Tableau des fréquences à assigner aux stations de navire dans la bande des 25 MHz

(kHz)

Limite	Fréquences d'appel à assigner aux stations de navire pour la télégraphie Morse de classe A1A ou A1B (*g*)	Limite	Fréquences (non appariées) à assignet aux stations de navire pour les systémes à bande étroite de télégraphie à impression directe et de transmission de données, à des rapidites de modulation ne depassant pas 100 bauds (*b*)	Limite	Fréquences de travail à assigner aux stations de navire pour la télégraphie Morse de classe A1A ou A1B (*e*)	Limite
25 070	—	25 076	25 076,3 ··· 25 089,8 *28 fréquences espacées de 0,5*	25 090,1	25 076,3 ··· 25 089,8 *35 fréquences espacées de 0,5*	25 110

(*a*) Voir l'apendice 16.
(*b*) Voir l'apendice 33.
(*c*) Ces bandes peuvent, de plus, être utilisées par les stations de bouée pout la transmition de données océanographiques et par les stations qui interrogent ces bouées, conformément aux disposition de la Resolution 314.
(*d*) Voir l'appendice 32.
(*e*) Dans les bandes de fréquences à utiliser pur les stations de navire pour la télégraphie Morse de classe A1A avec une rapidité de modulation ne dépassant pas 40 bauds, les administrations peuvent assigner des fréquences suplementaires intercalées entre les fréquences extrêmes á assigner. Toutes les fréquences ainsi assignées doivent être des multiples de 100 Hz. Les administrations doivent assurer une répartition uniforme de ces assignations dans les bandes et éviter, dans la mesure du possible, d'assigner les deux fréquences se trouvant à ± 100 Hz de chacune des fréquences en relation harmonique indiquées à la première ligne de chaque série dans l'appendice 35.
(*f*) Voir l'appendice 35.
(*g*) Voir l'appendice 34.
(*h*) Pour les conditions d'utilisation de fréquence 8364 kHz, voir le numéro 2988).

APPENDICE 32

NOC AP15A

Disposition des vois à utiliser pour les systèmes à bande étroit de télégraphie à impression directe et de transmission de données dans les bandes du service mobile maritime comprises entre 4000 kH3 et 23 000 kHz (fréquences appariées)

(Voir l'article 60 et la Résolution 300)

A chaque station côtière utilisant des fréquences appariées sont assignées une ou plusieurs paires de fréquences des séries, suivantes. Chaque paire comprend une fréquence d'émission et une fréquence de réception.

Table des fréquences des stations pour l'exploitation à deux fréquences

(kHz)

(a) Il convient que les administrations assignent la fréquence centrale de chaque voie du groupe approprié et ou de vois communes aux stations de navire que ne sont équipées que d'oscillateurs à commande par quartz et qui utilisent la relation harmonique pour l'appel en télégraphie Morse de classe A1A. Toutefois, elles peuvent subdiviser les voies du groupe approprié et les voies communes en fréquences d'appel déterminées, en commençant à 100 Hz de l'extrémité inférieure de la voie et en allant jusqu'à 100 Hz de son extrémité supérieure (voir l'exemple ci-dessous), et assigner ces fréquences à des navires équipés d'emetteurs à synthétiseurs de fréquence. Les administrations doivent éviter, dans la mesure du possible, d'assigner les deux fréquences se trouvant à ± 100 Hz de chacune des fréquences centrales en relation harmonique du present appendice.

Exemples de subdivision des voies (fréquences centrales en italique):

4/1/a	4 180,1	6/1/a	6 270,1	8/1/a	8 360,1	12/1/a	12 540,1	16/1/a	16 720,1
4/1/b	*4 180,2*	6/1/b	6 270,2	8/1/b	8 360,2	12/1/b	12 540,2	16/1/b	16 720,2
4/1/c	4 180,3	6/1/c	*6 270,3*	8/1/c	8 360,3	12/1/c	12 540,3	16/1/c	16 720,3
		6/1/d	6 270,4	8/1/d	*8 360,4*	12/1/d	12 540,4	16/1/d	16 720,4
		6/1/e	6 270,5	8/1/e	8 360,5	12 /1/e	12 540,5	16/1/e	16 720,5
				8/1/f	8 360,6	12/1/f	*12 540,6*	16/1/f	16 720,6
				8/1/g	8 360,7	12/1/g	12 540,7	16/1/g	16 720,7
						12/1/h	12 540,8	16/1/h	*16 720,8*
						12/1/i	12 540,9	16/1/i	16 720,9
						12/1/j	12 541,0	16/1/j	16 721,0
						12/1/k	12 541,1	16/1/k	16 721,1
								16/1/l	16 721,2
								16/1/m	16 721,3
								16/1/n	16 721,4
								16/1/o	16 721,5

(b) Dans de bandes des 22 MHz et 25 MHz les voies ne sont pas en relation harmonique avec celles des bandes des 4 MHz à 16 MHz. Toutefois, le principe de la subdivision des voies en fréquence d'appel déterminées, en commençant à 100 Hz de l'extrémité inférieure de la voie et en allant jusqu'à 100 Hz de son extrémite supérieure, s'applique.

NOC **AP15D**

APPENDICE 35

Tableau des fréquences de travail, en kHz, à assigner aux stations de navire pour la télégraphie Morse de classe A1A, à des rapidités de modulation ne dépassant pas 40 bauds

[Voir aussi le renvoi *e*) de l'appendice **31**]

Note. — La première ligne de chaque série, jusqu'à la série 53 y comprise, indique les fréquences en relation harmonique à assigner dans les bandes des 4, 6, 8, 12 et 16 MHz. Les autres fréquences ne sont pas necessairement en relation harmonique.

NOC **AP20** APPENDICE 36

Appareils automatique distinés à la réception des signax d'alarme radiotélegraphique et radiotélephonique

(voir la section II de l'article 41)

1. Les appareils automatiques destinés à la réception du signal d'alarme radiotélégraphique doivent satisfaire aux conditions suivantes:

a) L'appareil doit fonctionner sous l'action du signal d'alarme transmis par radiotélégraphie en émissions des classes A2B et H2B au moins (voir le numéro **4216**);

b) L'appareil doit enregistrer le signal d'alarme malgré les brouillages (à condition que ces brouillages ne soient pas continus) provoqués par les parasites atmosphériques et par des signaux puissants autres que le signal d'alarme, de préférence sans qu'aucun réglage manuel soit nécessaire pendant les périodes durant lesquelles la veile est assurée à l'aide de cet appareil;

c) L'appareil ne doit pas être mis en action par des parasites atmosphériques ou par des signaux puissants autres que le signal d'alarme;

d) L'appareil doit posséder un minimum de sensibilité tel que, si les parasites atmosphériques sont négligeables, il soit à même de fonctionner sous l'action du signal d'alarme transmis par l'émetteur de secours d'une station de navire, à toute distance de cette station jusqu'à concurrence de la portée normale fixée pour ledit émetteur par la Convention internationale pour la sauvegarde de la vie humaine em mer, et de préférence à des distance plus grandes.

e) L'appareil doit avertir de tout dérangement susceptible d'empêcher son fonctionnement normal pendant les périodes de veille.

2. Les appareils automatiques destinés à la réception du signal d'alarme radiotéléphonique doivent répondre aux conditions suivantes:

a) L'appareil doit fonctionner sous l'action du signal l'alarme malgré les brouillages intermittents provoqués par les parasites atmosphériques et par des signaux puissants autres que le signal d'alarme, de préférence sans qu'aucun réglace manuel soit nécessaires pendant les périodes durant lesquelles la veille est assurée à l'aide de cet appareil;

b) L'appareil ne doit pas être mis en action par des parasites atmosphériques ou par des signaux puissants autres que les signal d'alarme;

c) L'appareil doit pouvoir fonctionner au-delà de la distance à laquelle la transmission de la parole est satisfaisante; il doit, pour autant que c'est possible en pratique, comporter un dispositif signalant les dérangements susceptibles d'empêcher son fonctionnement normal pendant les périodes de veille.

NOC **AP20A** APPENDICE 37

Caractéristiques techniques des radiobalises de localisation des sinistres fonctionnant sur la fréquence porteuse 2182 kHz

(Voir la section I de l'article 41)

Les radiobalises de localisation des sinistres doivent satisfaire aux conditions suivantes:

a) La puissance rayonnée par les radiobalises à faible puissance (Type L) doit avoir la valeur nécessaire pour produire au niveau de la mer à une distance de 30 milles marins un champ dont l'intensité est égale ou inférieure à 10 microvolts par mètre, l'intensité de champ initiale étant d'au moins 2,5 microvolts par mètre;

b) La puissance rayonnée par les radiobalises à grande puissance (Type H) doit avoir la valeur nécessaire pour produire au niveau de la mer à une distance de 30 milles marins un champ dont l'intensité est supérieure à 10 microvolts par mètre;

c) Après une période de 48 heures de fonctionnement continu, la puissance rayonnée ne doit pas être inférieure à 20 % de sa valeur initiale;

d) Les radiobalises doivent pouvoir faire des émissions de la classe A2A (ou A2B) ou H2A (ou H2B) avec un taux de modulation compris entre 30 % et 90 %;

e) Les tolérances des fréquences acoustiques des émissions des radiobalises de localisation des sinistres (voir les numéros **3256** à **3258**) sont:

± 20 Hz pour la fréquence 1300 Hz;
± 35 Hz pour la fréquence 2200 Hz.

f) Le matériel doit être conçu de façon à être conforme aux Avis pertinents du CCIR.

NOC **AP20B** APPENDICE 38

Appareils à bande étroite de télégraphie à impression directe

(Voir les articles 59, 60, 63 et 64)

Les appareils à bande étroite de télégraphie à impression directe utilisés and le service mobile maritime doivent satisfaire aux conditions suivantes:

a) Les appareils doivent pouvoir fonctionner avec les signaux de l'alphabet télégraphique international N° 2 avec une rapidié de modulation de 50 baudes et fournier à leur sortie des signaux de même type susceptibles d'être ensuite transmis sur le réseau télégraphique public;

b) La rapidité de modulation sur le trajet radioélectrique ne doit pas dépasser 100 bauds;

c) Les émissions doivent être de la classe F1B, de déplacement de fréquence étant de 170 Hz (1);

d) La tolérance de fréquence du signal émis doit être de ± 40 Hz pour les stations de navire et de ± 15 Hz pour les sations côtières (2) (3) (4);

e) La fréquence émise supérieure doit correspondre à «traival» (départ) et la fréquence émisse inférieure à «respos» (arrêt), conformément à l'Avis pertinent du CCIR;

f) Lorsqu'un système de correction d'erreurs esat utilisé, il convient que l'appareil soit muni d'un dispositif simple pour court circuiter ce système, afin de permettre l'émission et la réception, sur le trajet radiélectrique, de signaux non corrigés conformes aux dispositions de l'alinéa *a*) ci-dessus;

g) Dans le service mobile maritime, lorsque la télégraphie à impression directe fait appel à un système de détection et de correction des erreurs, on doit employer un système ARQ à 7 moments ou un système également à 7 moments, sans circuit de retour et avec réception en diversité de temps, utilisant le même code. Il convient que les autres caractéristiques de l'appareil de détection et de correction des erreurs soient conformes aux Avis pertinents du CCIR;

h) Si une stations est pourvue d'un système d'appel sélectif confome aux dispositions de l'appendice **39** et d'un système à impression directe conforme aux dispositions du présent appendice, et qu'elle utilise un signal d'appel à deux blocs, on lur assigne pour les deux systèmes le même numéro d'identification ou d'appel sélectif en se conformant aux dispositions des numéros **2088** et **2143** à **2146**;

i) Si une station est pourvue d'un système à impression directe conforme aux dispositions du présent appendice et qu'elle utilise un système d'appel à deux blocs, et si un numéro ne lui a pas déjà été assigné conformément aux dispositions des numéros **2088** et **2143** à **2146**, il convient de lui assigner en tel numéro pour son système à impression directe;

f) La conversion de l'identification numérique aux combinaisons de 28 bits (4 caractères) s'effectue selon les Avis pertinents du CCIR.

NOC **AP20C** APPENDICE 39

Système d'appel sèlectif à utiliser dans le service mobile maritime international

(Voir les articles 25, 62, 63 et l'appendice 9)

Dans les cas il est nécessaire de satisfaire à des besoins immédiats en matière d'appel sélectif, le système utilisé doit présenter les caractéristiques suivantes:

1.1. Le signal d'appel sélectif doit comporter cinq chiffres représentant le numéro d'appel sélectif assigné à un navire pour l'appel sélectif.

---

(1) Lorsque l'on effectue la manipulation par déplacement de fréquence en injectant des signaux à fréquence acoustique à l'entrée d'un emetteur a bande laterale unique, il convient de veiller soigneusement à supprimer de maniére suffisante la porteuse résiduelle de l'émission à bande latérale unique. En outre, un choix judicieux de la fréquence acoustique centrale permettra de minimaliser la possibilite pour la porteuse résiduelle de causer des brouillages dans les voies voisines. Pour cette raision, certaines administrations ont choisi 1700 Hz comme fréquence centrale.

(2) Aux fins de l'exploitation, il convient que le matériel de réception associé soit compatible avec la stabilité de fréquence des emetteurs.

(3) Ces tolérances sont applicables aux appareils installés après le 1er janvier 1976 et à la totalite des appareils du 1er janvier 1985. Concernant les appareils installés avant le 2 janvier 1976, la tolérance est de 100 Hz pour les émetteurs de station de navire (avec une dérive maximale de 40 Hz pour de courtes périoles, de l'ordre de 15 minutes), et de 40 Hz pour les émetteurs de station côtière.

(4) Il sera peut être opportun de fixer des limites de tolérance plus strictes, en fonction de la méthode d'exploitation du service et du matériel utilisé.

1.2. Le signal à fréquence acoustique appliqué à l'entrée de l'émetteur de la station côtière doit être constitué d'une suite d'impulsions à fréquence acoustique conforme aux dispositions suivantes:

1.2.1. Les fréquences acoustiques qui servent à représenter les chiffres du numéro d'appel sélectif assigné à un navire doivent être prises dans la série suivante:

Chiffre	1	2	3	4	5	6	7	8	9	0	Répétion de chiffres
Fréquence acoustique (Hz).....	1 124	1 197	1 275	1 358	1 446	1 540	1 640	1 747	1 860	1 891	2 110

Par exemple la série d'impulsions à fréquence acoustique correspondant au numéro d'appel sélectif 12 133 serait 1124-1197-1124-1275-2110 Hz, et la série correspondant au numéro 22 222 serait 1197-2110-1197-2110--1197 Hz.

1.2.2. Si les numéros d'appel sélectif représentés à l'aide de deux fréquences seulement — choisies parmi celles indiquées au paragraphe 1.2.1 — sont réservés à l'appel de groupes prédéterminés de navires, on peut disposer de 100 combinaisons différentes à attribuer selon les besoins des administrations.

1.2.3. Les signaux produits par les générateurs de fréquences acoustiques doivent être essentiellement sinusoïdaux, avec une distorsion harmonique totale ne dépassant pas 2 %.

1.2.4. Les impulsions à fréquence acoustique doivent être transmises l'une après l'autre.

1.2.5. La différence entre les amplitudes maximales de deux impulsions quelconques ne doit pas dépasser 1 dB.

1.2.6. La durée de chaque impulsion à fréquence acoustique, mesurée entre les points à 50 % de l'amplitude maximale, doit être de 100 ms ± 10 ms.

1.2.7. L'intervalle de temps entre deux impulsions consécutives, mesuré entre les points à 50 % de l'amplitude maximale, doit être 3 ms ± 2 ms.

1.2.8. Le temps d'établissement et le temps d'extinction de chaque impulsion, mesurés entre les points à 10 % et à 90 % de l'amplitude maximale, doivent être de 1,5 ms ± 1 ms.

1.2.9. La tolérance des fréquences acoustiques indiquées au paragraphe 1.2.1. doit être de ± 4 Hz.

1.2.10. Le signal d'appel sélectif (numéro d'appel sélectif assigné à la station de navire) doit être émis deux fois, avec un intervalle de 900 ms ± 100 ms entre la fin du premier signal et le commencement du second (figure 1).

1.2.11. L'intervalle entre les appels d'une station côtière à des navires différents doit être au minimum d'une seconde (figure 1).

2. Les informations supplémentaires qui suivent le signal d'appel sélectif doivent être transmises de la façon suivante:

2.1. Quatre chiffres pour identifier la station côtière appelante.

2.2. Deux zéros suivis de deux chiffres pour indiquer la voie de transmission sur ondes métriques sur laquelle la réponse devrait être donnée (voir l'appendice **18**).

2.3. Les caractéristiques des signaux doivent être conformes aux dispostions des paragraphes 1.2.1 et 1.2.3 à 1.2.9 inclus.

2.4. La composition du signal doit être conformes au diagramme ci-annexé (figure 2), la tolérance sur l'intervalle de 350 ms étant de ± 30 ms.

3. Un signal spécial «appel à tous les navires», destiné à actionner les sélecteures de réception installés à bord de tous des navires, quel que soit leur numéro d'appel sélectif, doit comporter l'émission continue de la suite des onze fréquences acoustiques indiquées au paragraphe 1.2.2. Les caractéristiques des impulsions à fréquence acoustique doivent satisfaire aux dispositions des paragraphes 1.2.3., 1.2.4 et 1.2.9. La durée de chacune de ces impulsions, mesurée entre les points à 50 % de l'amplitude maximale, doit être de 17 ms ± 1 ms; l'intervalle de temps entre deux impulsions consécutives mesuré entre les points à 50 % de l'amplitude maximale, ne doit pas dépasser 1 m. Il convient une la durée totale du signal «appel á tous les navires» soit au minimum de cinq secondes.

4. Les sélecteurs de réception installés á bord des navires devraient avoir une bonne fiabilité de fonctionnement dans touts les conditions permettant d'obtenir des communications de qualité satisfaisante.

5. Le sélecteur de réception doit être conçu pour recevoir des signaux dénnis au paragraphe 1. Toutefois, compte tenu du fait que les stations côtières sont susceptibles d'émettre des signaux supplémentaires (par exemple, pour l'identification de la stations côtière), il importe que la durée de retour au repos du décodeur soit de 250 ms ± 40 ms.

6. Ce sélecteur devrait être conçu, réalisé et entretenu de manière telle qu'il puisse fonctionner en présence de bruits atmosphériques et d'autres signaux broulleurs y compris les signaux d'appel sélectif autres que celui pour lequel le décodeur a été réglé.

7. Le sélecteur de réception doit comporter un dispositif fournissant une indication acoustique ou visuelle de la réception d'un appel et, si cela est exigé, un dispositif complémentaire permettant de déterminer l'indentité de la station d'où émane l'appel ou la voie de transmission sur ondes métriques à utiliser pour la réponse, selon les besoins des administrations.

8. Ce dispositif indicateur doit entrer en fonctionnement lors de la réception correcte du signal d'appel, que l'enregistrement correct ait eu lieu lors de l'emission du permier signal d'appel par la station côtière, ou lors de sa répétition, ou dans les deux cas.

9. Le dispositif indicateur doit rester en position de fonctionnement jusqu'à ce qu'il ait été remis manuellement en position de repos.

10. Le sélecteur de réception devrait être aussi simple que possible; il devrait pouvoir fonctionner de façon sûre pendant de longues périodes avec un minimum d'enîretien et il pourrait utilement comporter des moyens permettant d'en faire l'essai sans apport extérieur.

NOC AP20D

APPENDICE 40

Systèmes à compressures et extensures couplés

(Voir la section IV de l'article 60 et l'appendice 17)

Lorsque le service mobile maritime radiotéléphonique international fait appel à des systèmes à compressures et extensures couplés:

a) Les caractéristiques du matérial à compresseurs et extenseurs couplés doivent être conformes aux dispositions des Avis pertinents du CCIR;

b) Pour obtenir le résultat optimal, les caractéristiques des appareils a bande latérale unique utilisés avec des systèmes à compresseurs et extenseurs couplés doivent être conformes aux dispositions de l'appendice 17 et il convient, en outre qu'elles satisfassent aux conditions suivantes:

1) La stabilité de fréquence à court terme (de l'ordre de 15 minutes) des émetteurs de station côtière est de ± 2 Hz;
2) La stabilité de fréquence à court terme (de l'ordre de 15 minutes) des émetteurs de navire est de ± 5 Hz;
3) Pour que la stabilité du gain total soit suffisante pendant la durée d'une communication, il faut que les récepteurs de station côtière soient munis de dispositifs permettant de maintenir l'erreur de fréquence d'une extrémité à l'autre à une valeur comprise entre ± 2 Hz et que les récepteurs de stations de navire soient munis de dispositifs permettant de maintenir cette erreur à une valeur comprise entre ± 5 Hz;
4) La variation maximale admissible de l'amplitude de l'émetteur dans la gamme des fréquences acoustiques 350-2700 Hz, à l'émission, est de 6 dB; le retard différentiel ne doit pas dépas ser 3 millisecondes. A cet égard, le récepteur doit avoir au moins les mêmes normes de fonctionnement;
5) Lorsqu'on n'utilise pas la porteuse pilote d'une émission de la classe R3E pour produire un signal continu destiné à la stabilisation de fréquence et à la commande de gain du récepteur, dans le cas d'une émission de la classe J3E par exemple, la procédure initiale d'accord doit comporter, pendant une brève période, l'émission d'une fréquence acoustique de référence appropriée (par exemple 1999 Hz ± 1 Hz) à un niveau de l'ordre de — 10 dBm0 ± 0,5 dB;
6) Au cas ou l'on désire utiliser des inverseurs ou d'autres types de dispositifs de secret, il faut tenir compte du fait que la fréquence acoustique supérieure de la voie téléphonique est 2380 Hz.

NOC AP23

APPENDICE 41

Procédure pour l'obtention des relèvements radiogoniométreques et des positions

(Voir l'article 35)

SECTION I

Instructions générales

§ 1. Les stations du service mobile aéronautique utilisent les procédures particulières qui peuvent être en vigueur en application d'accords conclus plar les administrations. Cependant, elles suivront les dispositions de cet appendice s'il leur est nécessaire de prendre part à des opérations de radiogoniométrie avec des stations du service mobile maritime.

§ 2. Avant d'appeler une ou plusieurs stations radiogoniométriques pour demander son relèvement ou sa position, la station mobile doit rechercher dans la Nomenclature des stations de radiorepérage et des stations effectuant des services spéciaux:

a) Les indicatifs d'appel des stations à appeler pour obtenir les relèvements ou la position qu'elle désire;
b) La fréquence sur laquelle les stations radiogoniométriques veillent, et la ou les fréquences sur lesquelles elles prennent les relèvements;
c) Les stations radiogoniométrique qui, grâce à des liaisons par circuits spéciaux, peuvent fonctionner en groupe avec la station radiogonimétrique à appeler.

§ 3. La procédure qui doit suivre la station mobile dépend de diverses circonstances. D'une façon générale, la station mobile doit tenir compte de ce qui suit:

a) Si les stations radiogoniométriques ne veillent par sur la même fréquence (que ce soit la fréquence sur laquelle elles opèrent le relèvement ou toute autre frequence), les relèvement doivent être demandés séparément à chaque station ou groupe de stations utilisant une fréquence déterminée;

b) Si toutes les stations radiogoniométriques intéressées veillent surl la même fréquence, et si elles sont en mesure de prendre des relèvements sur une fréquence commune (qui peut être différente de la fréquence de veille), la station mobile doit les appeler ensemble au même moment, afin que toutes ces stations prennent simultanément les relèvements sur une même émission;

c) Si plusieurs stations radiogoniométriques sont groupées à l'aide de circuits spéciaux, une seule d'entre elles, dite «station radiogoniométrique de contrôle», doit être appelée, même si toutes sont munies d'appareilsémetteurs. Dans ce cas, la station mobile doit cependant, si c'est nécessaire, mentionnner dans l'appel, au moyen de leurs indicatifs d'appel, les stations radiogoniométriques dont elle désire obtenir des relèvements.

§ 4. La Nomenclaure des stations de radiorepérage et des staions effectuant des services spéciaux contient les indications relatives:

a) Au type de signal et à la classe d'émission à employer pour obtenir les relèvements;

b) À la durée des émissions que doit faire la station mobile;

c) À l'heure qu'utilise la station radiogoniométrique considérée, si cette heure est différent de celle du Temps universel coordonné (UTC).

SECTION II

Règles de procédure

§ 5. Les règles de procédure suivantes, applicables suivantes, applicables à la radiotélégraphie et à la radiotéléphonie, sont basées sur l'emploi de la radiotélégraphie. Em radiotéléphonie, des phrases appropriées peuvent remplacer les abréviations réglementaires.

Obtention d'un relèvement

§ 6. (1) La station mobile appelle la sations radiogoniométrique ou station radiogoniométrique de contrôle sur la fréquence de veille indiquée par la Nomenclature des stations de radiorepérage et des stations effectuant des services spéciaux. Suivant le type d'informantion qu'elle désire, la station appelante transmet l'abréviation réglementaire appropriée, suivie, si la station radiogoniométrique est une stations mobile, de l'abréviation réglementaire QTH? Elle indique, si c'est nécessaire, la fréquence sur laquelle elle va émettre pour faire prendre son relèvement, puis elle attend des instructions.

(2) Au moyen de l'abréviation réglementaire appropriée, la station radiogoniométrique invite la station appelante à faire l'émission nécessaire pour le relèvement. Si c'est nécessaire, elle indique la fréquence à utiliser à cet effet et le nombre de fois que l'émission doit être répétée.

(3) Après avoir le cas échéant, réglé, sa nouvelle fréquence d'emission, la station appelante transmet deux traits d'environ dix secondes chacun suivis de son indicatif d'appel. Elle répète ces signaux autant de fois que la station radiogoniométrique le lui a demandé.

(4) La station radiogoniométrique détermine la direction et, sin possible, le sens du relévement et sa classe (voir le paragraphe 7).

(5) Si la station radiogoniométrique n'est pas satisfaite de l'opération, elle demande à la station appelant de répéter l'émission décrite à l'alinéa (3).

(6) La station radiogoniométrique transmet les renseignements à la stations appelant dans l'ordre suivant:

a) L'abréviation réglementaire appropriée;

b) Trois chiffres indiquant en degrés le relèvement vrai par rapport à la station radiogoniométrique;

c) La classe du relèvement;

d) L'heure de l'observation;

e) Si la station radiogoniométrique est mobile, sa propre position en latitude en longitude, précédée de l'abréviation réglementaire QTH.

(7) Dès que la sation appelante a reçu le résultat de l'observation, et si elle estime nécessaire d'en obtenir confirmation, elle répète le message. La sation radiogoniométrique confirme alors l'exactitude de la répétition ou, le cas échéant, rectifie en répétant le message. Quand la station radiogoniométrique a acquis la certitude que la station mobile a correctement reçu le message, elle transmet le signal «fin de travail». La station appelante répète alors ce signal pour indiquer que l'opération est terminée.

(8) A moins d'indications contraires, la station appelante considère que le sens du relèvement a été déterminé. Si la station radiogoniométrique n'a pas déterminé ce sens, elle en fait mention dans la transmission de l'information, ou bien elle indique les deux directions opposées qu'elle relevées.

Classification des relèvements

§ 7. En vue d'apprécier la précision et de déterminer la classe correspondante d'un relèvement:

a) Il convient, en général et notamment dans le service radiogoniométrique mobile maintenu sur les fréquences inférieurs à 3000 kHz, que l'opérateur utilise les caractéristiques types des relèvements indiquées au tableau ci-après;

b) Les opérateurs d'une station radiogoniométrique peuvent, lorsque la nature de l'équipement et le temps le permettent, tenir compte de la probabilité de l'erreur du relèvement. Un relèvement est considéré comme appartenant à une classe donnée, s'il ya a une probabilité de moins de $^1/_{20}$ que l'erreur de relèvement dépasse les valeurs numériques spécifiées pour cette classe au tableau ci-après. Il convient que cette probabilité soit évaluée au moyen de l'analyse des cinq composantes de la variance totale du relèvement (instrument, emplacement, propagation, échantillonnage des relèvements et condition d'observation).

Obtention d'une position déterminée par deux ou plusieurs stations radiogoniométriques organisées en groupe

§ 8. (1) Si la station appelante désire être informée de sa position par un groupe de stations radiogonimétriques, elle appelle la station de contrôle comme il est indiqué à l'alinéa (1) du § 6 ci-dessus, et demande sa position au moyen de l'abréviation réglementaire appropriée.

(2) La stations de contrôle répond à l'appel et, lorsque les stations radiogonimétriques sont prêtes, elle invite, au moyen de l'abréviation réglementaire appropriée, la station appelante à émettre. Lorsque la position a été déterminée, la station de contrôle transmet à la sations appelante:

a) L'abréviation réglementaire appropriée;
b) La position en latitude et longitude ou, s'il y a lieu, par rapport à un point géographique connu;
c) La classe de la position, définie à l'alinéa suivant;
d) L'heure de l'observation.

(3) Selon son appréciation de la précision de ses observations, la station de contrôle classe la position dans l'un des quatre classes suivantes:

Classe A — positions que l'opérateur peut raisonnablement considérer comme précises à moins de 5 milles nautiques près;
Classe B — positions que l'opérateur peut raisonnablement considérer comme précises à moins de 20 milles nautiques près;
Classe C — positions que l'opérateur peut raisonnablement considérer comme précises à moins de 50 milles nautiques près;
Classe D — positions que l'opérateur ne peut pas considérer comme précises à moins de 50 milles nautiques près.

(4) Cependant, pour les fréquences supérieures à 3000 kHz, dans le cas où les limites de distances fixées à l'alinéa précédent ne coviendraient pas, la station de contrôle peut classer la position selon les Avis du CCIR.

Obtention des relèvements simultanés de deux ou plusieurs stations radiogoniométriques organisées en groupe

§ 9. Sur une demande de relèvements, la station de contrôle d'un groupe de stations radiogoniométriques procède comme il est indiqué au § 8. Elle transmet ensuite les relèvements pris par chaque station du groupe, en faisant précéder chaque relèvement de l'indicatif d'appel de la station qui l'a pris.

TABLEAU

Classification des relèvements

Classe	Erreur absolue du relèvement (degrés)	Carectéristiques des relèvements					
		Force des signaux	Indication du relèvement	Evanouissement	Brouillage	Oscillation du relèvement (degrés)	Durée d'observation
A	± 2	Très bonne ou bone	Nette (zéro bien défini).	Négligeable	Négligeable	Moins de 3	Suffisante.
B	± 5	Assez bonne	Floue	Léger	Léger	Plus de 3 moins de 5.	Brève.
C	± 10	Faible	Très floue	Intense	Élevé	Plus de 5 moins de 10.	Très brève.
D	Plus de ± 10	À peine perceptible	Mal définie	Très intense	Très élevé	Plus de 10	Insuffisante.

(*) Les séries d'indicatifs d'appel précédées d'un astérisque sont attribuées à des organisations internacionales.

APPENDICE 43

Identités dans le service mobile maritime

1. *Considérations générales.*

1.1. Dans le service mobile maritime, les identités se composent d'une série de neuf chiffre transmis sur le trajet radioélectrique pour identifier d'une manière unique les stations de navire, les stations terriennes de navire, les stations côtières, les stations terriennes côtières et les appels de groupe.

1.2. Les identités des stations de navire doivent être conformes aux Avis pertinents du CCIR et du CCITT.

1.3. Ces identités sont composées de telle sorte que l'identité ou une partie de l'identité permette aux abonnés des services téléphonique ou télex reliés au réseau général des télécommunications d'appeler des navires en exploitation automatique dans le sens côtière-navire.

1.4. Il y a trois catégories d'identités dans le service mobile maritime:

i) Identités des stations de navire;
ii) Identités des appels de groupes;
iii) Identités des stations côtières.

1.5. La nationalité ou le pavillon d'une station est indiqué par un groupe de trois chiffres, les chiffres d'identification de nationalité (NID).

2. *Chiffres d'identification de nationalité (NID).*

Le tableau I donne les chiffres d'identification de nationalité attribués à chaque pays. Conformément au numéro **2087** dur Règlement des radiocommunications, le Secrétaire général est autorisé à attribuer des chiffres d'identification de nationalité aux pays qui ne figurent pas dans le tableau (1).

3. *Identité de la station de navire.*

L'identité de la station de navire se compose de 9 chiffres, comme il et indiqué ci-après:

N I D X X X X X X
1 2 3 4 5 6 7 8 9

où

N I D
1 2 3

représentent les chiffres d'identification de nationalité. Chaque X représente un chiffre compris entre 0 et 9.

4. *Identité de l'appel de groupe.*

L'identité de l'appel de groupe utilisée pour appeler simultanément plusieurs navires est formée comme suit:

0 N I D X X X X
1 2 3 4 5 6 7 8 9

le premier caractère étant un zéro et chaque X représentant un chiffre compris entre 0 et 9.

Le NID ne représente que le pays qui a assigné l'identité d'appel de groupe et n'empêche donc pas d'appeler des groupes composés de navires de différentes nationalités.

5. *Identité de station côtière.*

L'identité de la station côtière est composée comme suit:

0 0 N I D X X X X
1 2 3 4 5 6 7 8 9

les deux premiers caractères étant des zéros et chaques X représentant un chiffre compris entre 0 et 9.

Le NID représente le pays où est située la station côtière ou la station terrienne côtière.

TABLEAU I

Chiffres d'identification de nationalité (1)

Pays	**Chifres**

(1) Les détails relatifs à l'attribution des chiffres d'identification de nationalité (NID) devront être mis au point par le Secrétaire général, en coopération étroite avec le CCIR et le CCITT, conformément à la Résolution **313** et aux dispositons du présent appendice. En attendant que ces renseignements puissent être fournis à la prochaine conférence compétente pour décision, des attributions provisoires pourront être effectuées par le Secrétaire général. Ces attributions feront en conséquence l'objet d'un examen ou d'une révision par le conférence mentionnée ci-dessus.

ADD AP CB

APPENDICE 44

Numéros d'appel sélectif des stations de navire et numéros d'identification des stations côtières

PROTOCOLE FINAL

Au moment de signer les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), les délégués soussignés prennent note des déclarations suivantes, formulées par des délégations signataires:

Nº 1

Pour la République de Honduras

La République de Honduras, par l'intermédiaire de sa délégation à la Conférence administrative mondiale des radiocommunications (Génève, 1979), désire formuler les réserves suivantes:

a) Son Gouvernement se réserve le droit de prendre les mesures qu'il estimera nécessaires pour protéger ses intérêts si d'autres Membres de l'Union ne se conforment pas aux dispositions du Règlement des radiocommunications, de ses Annexes et des Protocoles qui y sont attachés;

b) De même, elle déclare que son Gouvernement se réserve le droit de formuler toute réserve jusqu'à la date de ratitification des Actes finals de la présente Conférence administrative mondiale des radiocommunications (Génève, 1979).

Nº 2

Pour la République du Guatemala

La délégation de la République du Guatemala:

a) Réserve à son Gouvernement le droit d'accepter et de ratifier en totalité ou en partie les Actes finals de la présente Conférence ainsi que leur application dans le cadre territorial reconnu par la Constitution de la République;

b) N'accepte pas les réserves exprimées par d'autres pays si celles-ci vont à l'encontre des intérêts nationaux, selon l'appréciation définitive que le Gouvernement de la République du Guatemala formulera au moment d'accepter et de ratifier les Actes finals de la Conférence.

Nº 3

Pour la République du Tchad

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République du Tchad déclare, en ce qui concerne la protection de ses intérêts en matière de télècommunications, que la souveraineté de son État ne pourra en aucune manière être effectée par des dispositions adoptées par la présente Conférence ou les réserves formulées par d'autres États Membres de l'Union.

En conséquence, elle réserve le droit à son Gouvernement de prendre les mesures qu'il jugera nécessaires pour protéger ses services de télécommunications.

Nº 4

Pour la République Algérienne Démocratique et Populaire, le Royaume de l'Arabie Saoudite, l'État de Bhareïn, la République Popular du Bangladesh, les Emirats Arabes Unis, la République Islamique d'Iraq, le Royaume Hachémite de Jordanie, l'État de Koweït, le Liban, la Libye (Jmahiriya Arabe Libyenne Populaire Socialiste), le Royaume du Maroc, le Sultanat d'Oman, la République Islamique du Pakistan, l'État du Qatar, la République Arabe Syrienne, la République Démocratique Somalie, la République Démocratique du Saudan, la Tunisie et la Répulique Démocratic Populaire du Yémen.

Les délégations des pays susmentionnées déclarent que la signature et l'approbation ultérieure éventuelle par leurs Gouvernements repectifs des Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979) n'impliquent en aucune manière la reconnaissance d'Israël.

Nº 5

Pour la Bélgique

L'administration Belge a l'intention de mettre rapidement en service um réseau de stations de radiodiffusion dans la bande 100-104 MHz.

Elle insiste vivement auprès des administrations concernées pour que celles-ci envisagent dès maintenant les mesures rendant possible cette mise en service.

Nº 6

Pour la République Populaire du Bénin

La délégation de la République Populaire du Bénin réserve à son Gouvernement le droit de prendre toutes les mesures nécessaires pour protéger ses intérêts si des réserves formulées par d'autres délégations compromettaient le bon fonctionnement de ses services de télécommunication.

Nº 7

Pour le Chili

Se référant aux décisions prises par la Conférence administrative mondiale des radiocommunications (Génève, 1979), au sujet des assignations de fréquence qui figureront dans le Fichier de référence international des fréquences, tenant compte également des dispositions de l'article quatre, numéro deux, du Traité l'Antarctique signé à Washington le premier décembre 1959, et réitérant les termes du número VIII du Protocole final à la Convention internationale des télécommunications signée à Malaga-Torremolinos, 1973, la délégation du Chili déclare que, sur le territoire antarctique chilien, territoire sur lequel il exerce la souveraineté, son Gouvernement se réserve le droit d'assigner et de reconnaître les fréquences qu'il estimera nécessaires pour les services de radiocommunication, présents et futurs, qui fonctionneront dans les limites dudit territoire.

Nº 8

Pour Cuba

La délégation de Cuba, représentant son Gouvernement et au nom de celui-ci, déclare qu'elle ne reconnaît aucune valeur juridique ni morale à la signature des Actes finals par les représentants du régime de Pol Pot à la Conférence administrative mondiale des radiocommunications (Génève, 1979), sur la base des considérations suivantes:

Le régime génocide de Pol Pot ne représente pas les interêts légitimes du peuple du Kampuchea et n'exerce aucune autorité sur ce pays;

L'inscription du régime de Pol Pot à la présente Conférence est purement formelle; elle répond à des intérêts exclusivement politiques, comme en témoigne l'absence de participation aux travaux et débats de la Conférence. Du fait qu'il est dépourvu d'autorité sur le territoire de ce pays et qu'il n'y exerce aucune juridiction, ce régime ne peut réglementer le fonctionnement des télécommunications.

La délégation de Cuba considère que, en l'absence des représentants légitimes du peuple de Kampuchea, le Conseil Populaire Révolutionnaire, les Actes finals de la Conférence ne doivent porter aucune signature d'une représentation du Kampuchea.

Nº 9

Pour Cuba

En signant et en acceptant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979) au nom du Gouvernement de la République de Cuba, la délégation de Cuba déclare que cela ne signifie en aucune manière qu'elle reconnaît la notification, l'inscription et l'utilisation de fréquences par le Gouvernement nord-américain, dans la partie du territoire cubain de la Province de Guantanamo qui est occupée illégalement et contre la volonté du peuple cubain.

L'utilisation de fréquences radioélectriques par le Gouvernement des États-Unis sur le territoire qu'il usurpe à Guantanamo. Cuba, constitue un obstacle aux services de télécommunications de Cuba et à l'exercice de la souveraineté de notre pays sur le spectre des fréquences radioélectriques, qui représente une ressource limitée.

Le Gouvernement de Cuba se réserve le droit de prendre toutes les mesures nécessaires pour la sauvegarde de ses intérêts légitimes.

Nº 10

Pour la République Islamique d'Iran

Cette Conférence n'a pas été en mesure de répondre de façon satisfaisante aux besoins du service de radiodiffusion à ondes décamétrique, dans les attributions de bandes de fréquences révisées, notamment dasn les bandes des 6 et 7 MHz. Si la Conference projetée de radiodiffusion à ondes décamétriques n'est pas habilitée, de par son ordre du jour, à disposer de certaines parties du spectre attribuées au service fixe, elle sera dans l'impossibilité de planifier l'utilisation de toutes les bandes de fréquences de manière á permettre aux pays d'assurer leurs services de radiodiffusion en cas de variations des conditions de propagation dans toute l'etendue du cycle d'activité solaire. En l'absence d'un

plan adéqual, l'Administration de la République Islamique d'Iran se réserve le droit de prendre les mesures nécessaires pour utiliser les portions des bandes 5850-5950 kHz et 7300-7400 kHz également pour les services de radiodiffusion, selon les besoins de cette Administration.

Nº 11

Pour la République Démocratique d'Afghanistan

La délégation de la République Démocratique d'Afghanistan réserve pour son Gouvernement le droit de continuer à utiliser les services fixe et mobile dans les bandes attribuées en exclusivité au service mobile maritime au-dessous de 10 MHz. Ces bandes seront utilisées pour les besoins intérieurs de l'Afghanistan et de manière à ne pas causer de brouillages préjudiciables au service mobile maritime.

Nº 12

Pour la République Islamique de Mauritanie

La délégation de la République Islamique de Mauritanie déclare que la signature des Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979) ainsi que la ratification éventuelle ultérieure desdits Actes finals par son Gouvernement n'impliquent en aucune manière la reconnaissance de l'État d'Israël.

Nº 13

Pour la République Islamique du Pakistan

Consideránt:

a) Que l'établissement d'un plan de radiodiffusion à ondes décamétriques est la condition indispensable du respect de la égalité e de l'ordre dans cette partie du spectre;
b) Que tous les efforts faits jusqu'ici pour élaborer un tel plan échoué en raison des attributions inadéquates au service de radiodiffusion dans la gamme des ondes décamétriques, notamment dans les bandes de fréquences le plus basses;
c) Qu'aucun élargissement des bandes de radiodiffusion des 6 MHz et 7 MHz, particulièrement importantes, n'a été approuvé par la présente Conférence;
d) Que le renvoi 531 concernant la partie élargie des bandes attribuées au service de radiodiffusion est trop rigide et ne laisse aucune marge de manœuvre à la prochaine Conférence administrative mondiale des radiocommunications;
e) Que la période de transfert des assignations déplacées en raison de l'élargissement des bandes attribuées au service de radiodiffusion est trop longue;
f) Que les émissions de radiodiffusion d'un petit nombre de pays dans des bandes 6 MHz et 7 MHz débordent déjà sur les bandes adjacentes attribuées aux services fixes, avec une puissance totale de 12,5 megawatts;
g) Que pour des raisons d'équité, ces émissions de radiodiffusion hors bande se multiplieront si la Conférence administrative mondiale des radiocommunications proposée ne parvient pas, faute d'attributions satisfaisantes, à établir un plan acceptable de radiodiffusion à ondes décamétriques;
h) Qu'il ne ser plus possible avant très longtemps de corriger ces erreurs d'attribution;

la délegation du Gouvernement du Pakistan á la présente Conférence administrative mondiale des radiocommunications de l'Union internationale des télécommunications ne peut accepter ni les attributions figurant dans le tableau d'attribution pour les bandes 5830-5950 kHz et 7300-7500 kHz, ni le renvoi 531 et ses conséquences. Cela étant, elle réserve à son Gouvernement le droit de prendre toutes les mesures qu'il estime appropriées pour protéger ses intérêts.

Ladite délégation garantir toutefois la coopération et la participation pleine et entière de son Administration à la préparation du plan de radiodiffusion à ondes décamétriques, conformément à la décision de la présente Conférence. Elle garantit également que les réserves ci-dessus deviendront caduques dès qu'un plan de radiodiffusion à ondes décamétriques acceptable aura été élaboré et mis en application.

La délégation de la République Islamique du Pakistan réserve en outre à son Gouvernement le droit d'accepter ou non les conséquences que pourrait entrainer le non-respect par tout autre Membre de l'Union des dispositions des Actes finals de la Conférence et du Règlement des radiocommunications. En pareil cas, le Pakistan se reserve le droit de prendre toutes les mesures nécessaires pour proteger ses intérêts.

Nº 14

Pour la Grèce et la République Socialiste Fédérative de Yougoslavie

Dans la bande 415-495 kHz, la présent Conférence a adopté, pour la Région 1, des attributions différentes decelles des Régions 2 et 3. Les deux services auxquels cette bande est attribuée, à savoir le service de radionavigation aeronautique et le service mobile maritime, sont tous deux services extrêmement importants du point de vue de la

sécurité. Les délégations des pays mentionnés ci-dessus estiment donc que cette decision suscitera de graves problèmes en ce qui concerne la sauvegarde de la vie humaine.

Pour éviter toute répercussion de cette décision, les délégations des pays mentionnés ci-dessous ont proposé, à toutes les etapes des déliberations de la présente Conférence, des solutions visant à garantir la protection absolue de ces services et en particulier du service de radionavigation aéronautique. Ces solutions n'ayant pas été retenues par la présente Conférence, les délégations en question déclarent que leurs administrations ne peuvent assumer la responsabilité des conséquences éventuelles d l'utilisation de cette bande telle qu'elle a été décidée, en raison du caractère international des deux services.

De plus, les délégations mentionnées ci-dessus déclarent qu'elles réservent à leurs administrations le droit de modifier les assignations de fréquence de leurs stations côtières dans la bande 415-435 kHz jusqu'à la date d'entrée en vigueur d'une version révisée du Plan de Copenhague qui spécifiera des fréquences de remplacement dans la bande 435-495 kHz, quelle que soit la date arrêtée.

Nº 15

Pour la République Orientale de l'Uruguay

La délégation de la République Orientale de l'Uruguay déclare que devant la réduction de la largeur des bandes de fréquences attribuées au service fixe entre 4 MHz et 27,5 MHz, et étant donné qu'il n'a pas été prévu de procédure de réassignation des fréquences qui permettrait de garantir de façon certaine la continuité de fonctionnement des stations radioélectriques de l'Uruguay lorsque le service de radiodiffusion et le service mobile maritime utiliseront les parties de bandes qui ont été retirées au service fixe, son Gouvernement se réserve le droit d'adopter les mesures qu'il jugerait nécessaires pour continuer d'utiliser sous une forme adéquate les fréquences du service fixe qui sont inscrites au nom de l'Uruguay dans le Fichier de référence international des fréquences — fréquences qui revêtent une importantce vitale pour le pays — jusqu'à ce que soient fournies de nouvelles fréquences de remplacement permettant le bon fonctionnement des services de radiocommunication de l'Uruguay.

La délégation de la République Orientale de l'Uruguay doute que, dans les bandes du service fixe ainsi réduites, et particulièrement dans certaines zones ou sous-régions dans lesquellles les spectre est déjà encombré, il soit possible de réassigner les voies à transférer, malgré la réduction des valeurs des paramètres techniques applicables à ses circuits.

La délègation de la République Orientale de l'Uruguay réserve, en outre, à son Gouvernement le droit d'adopter les mesures qu'il jugerait nécessaires pour protèger ses intérêts au cas où les fréquences de remplacement attribuées à une autre administration compromettraient son système de radiocommunication.

Nº 16

Pour le Japon

Les brouillages causés par certaines stations de radiodiffusion de la Région 1 fonctionnant dans la bande des ondes kilométriques compromettent la bonne marche des stations de radiophare aéronautiques au Japon. Ces brouillages augmenteront considérablement lorsque de nouveaux émetteurs de radiodiffusion à ondes kilométriques seront mis en service ou lorsque des modifications seront apportées aux caractéristiques des assignations existantes à des stations de radiodiffusion à ondes kilométriques.

Comme le mentionnent explicitement les considérants de la Résolution Nº 7 de la Conférence administrative régionale de radiodiffusion à ondes kilométriques et hectométriques (Génève, 1975) et le paragraphe 4.4.4.1 du rapport de la Reúnion spéciale préparatoire du CCIR (Génève, 1978), l'utilisastion de la bande des ondes kilométriques par les stations de radiodiffusion de la Région 1 peut défavorablement influer sur les stations d'autres services de radiocommunication auxquelles cette bande est attribuée dand d'autres régions, en particulier les stations du service de radionavigation aéronautique utilisées pour la sauvegarde de la vie humaine.

Cependant, la présente Conférence n'a pas résolu le problème susmentionné en ce qui concerne l'utilisation de la bande des ondes kilométriques. De plus, elle a adopté une Résolution relative à la modification des fréquences porteuses des stations de radiodiffusion á ondes kilométriques dans la Région 1, sans prendre dûment en considération les possibilités de brouillage supplémentaires qui peuvent en résulter pour les stations de radiophare aéronautiques de la Région 3.

Par conséquent, la délégation du Japon réserve à son Gouvernement le droit de prendre les mesures nécessaires, y compris un réaménagement de ses assignations de fréquences dans la bande comprise entre 130 kHz et 526,5 kHz, sans tenir compte des attributions faites dans le Règlement des radiocommunications, au cas où des stations de radiodiffusion de la Région 1 porteraient gravement atteinte au bon fonctionnement des stations de radiophare aéronautiques du Japon dans la bande de fréquences comprise entre 190 kHz et 285 kHz.

Nº 17

Pour la République Fédérale de Nigeria

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République Fédérale de Nigeria réserve à son Gouvernement le droit de prendre toutes les dispo-

sitions qu'il jugera nécessaires pour sauvegarder ses intérêts au cas où les réserves ou les interprétations erronées des Actes finals formulées par d'autres pays organisations constitueraient une menace pour les services de télécommunication de la République Fédérale de Nigeria ou leur porteraient préjudice.

La délégation de la République Fédérale de Nigeria ne peut accepter en particulier la décision prise par cette Conférence concernant les liaisons de connexion du service de radiodiffusion par satellite dans la bande 14,0-14,8 GHz, pour les raisons suivantes:

a) La Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite de 1977 a établi un plan pour les liaisons descendantes dans la bande 11,7-12,5 GHz sur une largeur de bande de 800 MHz;

b) La largeur de bande qui a été attribuée en exclusivité aux liaisons de connexion du service de radiodiffusion par satellite dans nottre bande de fréquences préférée (14,5-15,3 GHz) n'est que de 300 MHz dans la bande 14,5-14,8 GHz acceptée par la Conférence. Cette largeur de bande ne ser pas suffisante étant donné le grand nombre d'administrations que l'on compte par position orbitale.

N° 18

Pour la République du Zaire

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République du Zaire réserve à son Gouvernement le droit de prendre toutes les mesures qu'il estime nécessaires afin d'assurer la protection de ses services de radiocommunications au cas où certains Membres de l'Union n'observaient pas les dispositions du Règlement de radiocommunication ou, si les réserves formulées par les délégations d'autres pays compromettaient le bon fonctionnement des services de radiocommunication Zairois.

N° 19

Pour le Canada

a) Satellites du service mobile fonctionnant dans la bande des ondes décimétriques:

Le Canada convient que les systèmes mobiles à satellites qu'il mettra au point conformément au numéro 641 du Règlement des radiocommunications doivent être coordonnés et notifiés relativement aux articles 11, 13 et 14. Mais, une fois ces satellites mis en service, le Canada considère qu'ils fonctionneront dans le cadre d'une attribution à titre primaire pendant toute leur durée de vie utile.

b) Radiodiffusion à ondes décamétriques:

Le Canada considère que la présente Conférence n'a pas apporté de solution au grave encombrement des bandes attribuées au service de radiodiffusion à ondes décamétriques au-dessous de 9 MHz. La Conférence a rejeté á une très faible majorité une proposition du Canada visant à ajouter dans le monde entier une bande de 100 kHz, entre 7300 kHz et 7400 kHz, aux fréquences attribuées à ce service, alors que cette adjonction aurait permis de résoudre le problème. C'est pourquoi, en signant les présents Actes finals, le Canada se réserve le droit de répondre à certains de ses besoins de radiodiffusion en recourant à la bande 7300-7400 kHz. Dans le mesure du possible, le Canada respectera bien entendu les droits des administrations dont les services seront exploités conformément aux Actes finals de la présente Conférence.

N° 20

Pour la République Populaire de Chine

Au moment de signer les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République Populaire de Chine déclare ce qui suit au nom du Gouvernement chinois:

La délégation de la Chine prend note de la décision prise par la présente Conférence au sujet de la convocation d'une Conférence administrative mondiale des radiocommunications chargée d'établir un plan pour les bandes d'ondes décamétriques attribuées au service de radiodiffusion et estime qu'il s'agit d'une mesure efficace qui permettra de résoudre le problème de l'encombrement dans les bandes attribuées à la radiodiffusion en ondes décamétriques et celui des émissions hors bande. Toutefois, pour des raisons de nature historique l'Administration de la Chine se réserve le droit de continuer à employer les fréquences qu'elle utilise actuellement pour la radiodiffusion dans la bande 5060-27 500 kHz jusqu'à l'établissement et à la mise en œuvre du plan de radiodiffusion à ondes décamétriques proposé.

Nº 21

Pour le Chili

La délégation du Chilie à la Conférence administrative mondiale des radiocommunications (Génève, 1979), déclare, au sujet des obligations découlant du Règlement des radiocommunications révisé, et plus particulièrement en ce qui concerne le transfert des attributions actuelles du service fixe au profit d'autres services dans la bande des ondes décamétriques qu'elle fera tous les efforts nécessaires pour appliquer la nouvelle réglementation.

Néanmois, elle réserve à son Gouvernement le droit de prendre toutes les mesures qu'il estimera nécessaires pour maintenir en service, à l'intérieur du territoire national, les liaisons du service fixe qui, pour des raisons de faisabilité technique, économique ou autre, ne pourraient être transférées dans les délais fixés par la présente Conférence.

Nº 22

Pour la République de l'Inde

Au moment de signer les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la República de l'Inde n'accept pas les répercussions quelles qu'elles soient, des réserves que pourrait formuler toute autre administration concernant les dispositions des Actes finals. La délégation de la République de l'Inde réserve á son Gouvernement le droit de prendre toutes les mesures qu'il pourrait juger nécessaires pour protéger ses intérêts au cas où une administration n'observerait pas les dispositions du Règlement des radiocommunications telles qu'elles ont été révisées par la présente Conférence.

Nº 23

Pour le Mexique

La délégation du Mexique, en signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), exprime l'intention de son Administration de se conformer aux dispositions du Règlement des radiocommunications, telles qu'adoptées par ladite Conférence; toutefois, elle déclare que son Gouvernement se réserve le droit de prendre les mesures qu'il estimera nécessaires pour protéger ses intérêts, au cas où um Membre de l'Union ne respecterait pas les dispositions dudit Règlement.

De même, da délégation du Mexique déclare que son Administration fera tous ses efforts pour que le transfert des stations des services fixe et mobile terrestres actuellement enregistrées conformèment au Tableau d'attribution des bandes de fréquences en vigueur, se fasse dans les délais adoptés, afin que leur utilisation soit conforme au nouveau Tableau. Néanmoins, si à la suite des décisions prises par la présente Conférence pour réduire les bandes attribuées à ces services ou pour limiter leur opération dans les bandes d'ondes décamétriques au profit d'autres services, lesdites stations ne peuvent continuer à fonctionner efficacement dans les bandes qui leur ont été assignées ou dans les bandes de remplacement éventuelles, le Gouvernement du Mexique se réserve le droit d'adopter les mesures qu'il jugera appropriées pour assurer le fonctionnement satisfaisant de ces stations.

Nº 24

Pour la République de Côte d'Ivoire

La délégation de la République de Côte d'Ivoire réserve pour son Gouvernement le droit de prendre toutes les dispositions qu'il jugera nécessaires pour assurer la protection et le bon fonctionnement de ses services de télécommunications en cas de non observation par les autres Membres de l'Union des dispositions contenues dans le Règlement des radiocommunications (Génève, 1979).

Nº 25

Pour la République Islamique d'Iran

En ce qui concerne les attributions dans la bande 150-285 kHz inscrites au Tableau d'attribution des bandes de fréquences et approuvées par la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de l'Iran déclare:

a) Que les stations de radiodiffusion à ondes kilométriques de grande puissance de la Région 1 causent déjà des brouillages préjudiciables à la radionavigation aéronautique;

b) Que des modifications des caractéristiques de puissance ou des fréquences des émetteurs de radiodiffusion à ondes kilométriques ou bien l'entrée en service de nouvelles assignations dans la bande des ondes kilométriques (150-285 kHz), augmenteront ces brouillages et rendront par conséquent l'utilisation actuelle de la radionavigation aéronautique beaucoup plus difficile en Iran;

c) Que, en conséquence, l'Administration de la République Islamique d'Iran réserve pour son pays le droit de prendre les mesures nécessaires pour assurer la protection du service de radionavigation aéronautique;

d) Qu'elle réserve également son droit d'utiliser aussi la section 160-190 kHz de la bande 150-285 kHz pour le service de radiodiffusion à ondes kilométriques selon les besoins de l'Iran.

Nº 26

Pour la République de Venezuela

En signant les Acts finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979) la délégation de Venezuela exprime l'intention de son administration de se conformer aux dispositions du Règlement des radiocommunications révisé. Néanmoins, elle déclare que son Gouvernement se réserve le droit d'adopter les mesures qu'il estimera nécessaires pour protéger ses intérêts, plus particuliérement en ce qui concerne les services fixe et mobile au-dessous de 9975 kHz, ainsi que dans le cas où un Membre de l'Union n'observerait pas les dispositions du Règlement des radiocommunications (Génève, 1979) ou si les réserves formulées par d'autres pays portaient préjudice à ses services de télécommunications actuels ou en projet.

Nº 27

Pour l'État de la Cité du Vatican, l'Italie, le Portugal et la Turquie

De l'avis des Administrations précitées, la présente Conférence n'a pas adopté de dispositions appropriées pour répondre aux besoins du service de radiodiffusion à ondes décamétriques, en particulier dans les bandes des 6 MHz et 7 MHz. De ce fait, la Conférence prévue dans la Resolution 508 ne pourra pas établir un plan pour toutes les bandes de fréquences attribuées à la radiodiffusion à ondes décamétriques et ces pays ne pourront donc pas assurer une exploitation continue de leur service de radiodiffusion à ondes décamétriques dans des conditions de propagation variant d'un bout à l'autre du cycle solaire.

En conséquence, les Administrations précitées se réservent le droit de prendre les mesures nécessaires pour répondre aux besoins de leur service de radiodiffusion à ondes décamétriques.

Nº 28

Pour la France, la Principauté de Liechtenstein et la Conférence Suisse

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), les délégations des pays susmentionnés déclarent réserver leurs droits de prendre toute mesure jugée nécessaire pour protéger leurs intérêts, si des réserves déposées ou d'autres mesures prises devaient avoir pour conséquences de porter atteinte au bon fonctionnement de leurs services de radiocommunications ou si certains Membres devaient manquer de se conformer aux dispositions en vigueur du Règlement des radiocommunications en particulier au cas où ils établiraient ou exploiteraient, ou encore laisseraient établir ou exploirer, sur leur territoire, sans coordination préalable, des stations du service de radiodiffusion ne respectant pas les dispositions du Nº 2666 du Règlement des radiocommunications.

Nº 29

Pour la République Fédérative du Brésil

La présent Conférence a adopté la Résolution 4, relative à la durée de validité des assignations de fréquence aux stations spatiales utilisant l'orbite des satellites géostationnaires. A ce propos, la délégation de la République Fédérative du Brésil souhaite formuler les observations suivantes:

a) Il est inutile d'adopter, à la présente Conférence, la procédure expérimentale décrite dans la Résolution en question, compte tenu des dispositions réglementaires existantes de l'article 13;
b) La période fixée pour l'application de la procédure expérimentale, qui va du 1er juillet 1980 à la prochaine Conférence mondiale des radiocommunications spatiales, ne correspond pas à la période, bien plus longue, qui serait nécessaire à la pleine application de cette procédure de manière à obtenir des résultats significatifs permettant d'en mesurer l'utilité;
c) Les procédures adoptées aux termes de la Résolution en question peuvent facilement donner à penser qu'un pays ou groupe de pays donné a un droit de priorité permanent et peut s'approprier des assignations de fréquence et des positions orbitales, ce qui va à l'encontre des principes exposés dans l'article 33 de la Convention internationale des télécommunications de l'UIT (Malaga-Torremolinos, 1973) et dans les Résolutions 2 et 3 adoptées par la présente Conférence.

Par conséquent, en signant les Actes finals de la présente Conférence, la délégation de la République Fédérative du Brésil réserve les droits de son Gouvernement en ce qui concerne l'application de la Résolution 4 par un pays ou groupe de pays donné, chaque fois cette application est considérée comme contraire aux dispositions des articles 11 et 13 adoptés par la présente Conférence administrative mondiale des radiocommunications (Génève, 1979).

Nº 30

Pour l'État d'Israël

La délégation d'Israël déclare que la signature qu'elle apposera sur l'Accord et l'éventuelle approbation de cet Accord par son Administration ne prendront effet et n'entraîneront pour Israël d'obligation qu'à l'égard des administrations qui appliquent les dispositions de la Convention dans leurs relations avec l'État d'Israël.

Israël se considére inclus également, à tous égards, dans les renvois 621 (174-223 MHz) et 866 (15,7-17,3 GHz) — en dépit des objections infondées d'un très petit nombre de délégations.

Tout en appuyant le principe d'une planification des bandes d'ondes décamétriques pour le service de radiodiffusion, conformément à la Résolution 508 de la présente Conférence, la délégation d'Israël note:

a) Que les bandes d'ondes décamétriques attribuées par la présente Conférence au service de radiodiffusion ne sont pas suffisantes pour assurer une base appropriée à une telle planification;

b) Que la présente Conférence n'a pris aucune disposition contre le «brouillage intentionnel» — alors qu'il est notoire que certain Membres de l'Union causent délibérément des brouillages préjudiciables aux services de radiodiffusion;

c) Que cette pratique du brouillage intentionnel rend inutilisable plus de 50 % du spectre des fréquences attribué au service de radiodiffusuion, qu'elle est absolument incompatible avec la notion même de planification et qu'elle constitue une violation flagrante de la lettre et de l'esprit de la Convention de l'UIT et du Règlement des radiocommunications.

Dans ces conditions, Israël se réserve le droit de prendre toute mesure nécessaire pour assurer le bon fonctionnement et une protection adéquate de ses services de radiodiffusion. Ce faisant, Israël s'efforcera néanmoins, dans la mesure du possible, de respecter les droits des administrations dont les services sont exploités conformément à la Convention et aux Actes finals de la présente Conférence.

Nº 31

Pour la Turquie

En signant les Actes finals de la présent Conférence au nom de son Gouvernement, la délégation de la Turquie à la Conférence administrative mondiale des radiocommunications (Génève, 1979), déclare officiellement que le Gouvernement de la Turquie n'accepte aucune obrigation découlant de l'attribution additionnelle (renvoi 694) de la bande de fréquences 645-862 MHz au service de radionavigation aéronautique à titre permis, afin d'assurer la protection du service de radionavigation aéronautique contre les stations de radiodiffusion existentes ou en projet qui fonctionnent conformément au Tableau d'attribution des bandes de fréquences dans la zone située à l'est de 40° Est.

Nº 32

Pour la République fédérale d'Allemagne, la Belgique, le Danemark, les États-Unis d'Amérique, a Grèce, l'Islande, l'Italie, le Luxembourg, la Norvège, le Royaume des Pays-Bas, le Portugal, le Royaume-Uni de Grande Bretagne et d'Irlande du Nord et la Turquie

Les Administrations des pays susmentionnés se réservent le droit d'exploiter des systèmes, dans le service mobile par satellite, dans la bande de fréquences 235-399,9 MHz aux termes des dispositions du renvoi du Tableau d'attribution des bandes de fréquences pertinent, sous la seule réserve de la procédure de coordination prévue à l'article 14. La disposition supplémentaire de ce renvoi impose une condition d'absence de brouillage qui pourrait conduire à demander d'interrompre l'exploitation d'un système à satellites ayant déjà fait l'objet d'une coordination si une administration, tout en ayant approuvé le système à satellites en question, venait à mettre en œuvre ou simplement à envisager la mise en œuvre d'un système susceptible de subir des brouillages préjudiciables. Les Administrations susmentionnées n'acceptent pas cette condition.

Nº 33

Pour l'Autriche, le Danemark, l'Espagne, la Finlande, la Principauté de Liechtenstein, la Norvège, le Portugal, la Suède et la Confédération Suisse

En signant les Actes finals de la Conférence, les délégations de l'Autriche, du Danemark, de l'Espagne, de la Finlande, de la France, du Liechtenstein, de la Norvège, du Portugal, de la Suède et de la Suisse, tiennent à faire la déclaration suivante:

La Conférence administrative mondiale des radiocommunications (Génève, 1979), a refusé d'insérer dans le Règlement des radiocommunications une disposition qui aurait permis d'attribuer au service mobile

aéronautique de certains pays de la Région 1 et de la Région 2 la bande de fréquences 862-960 MHz. La disposition proposée limitait clairement l'exploitation de ce service à un petit nombre de voies à l'intérieur de cette bande dans le cadre d'un système radiotéléphonique public et sous rèserve d'accords obtenus conformément à la procédure prévue dans l'article 14.

La disposition proposée était destinée à favoriser l'intégration éventuelle de certaines stations d'aéronefs dans un réseau radiotéléphonique public intégré au sol, et à protéger em même temps les autres services fonctionnant conformément au Tableau d'attribution des bandes de fréquences.

De nombreux pays ont besoin, d'urgence, de service mobiles téléphoniques publics; la croissance de ces besoins devrait encore s'accélérer avec l'amélioration des réseaux téléphoniques publics traditionnels.

Les délégations susmentionnées, notant avec beaucoup de préoccupations que la reconnaissance internationale a été refusée à cette attribution, réservent à leurs Administrations le droit d'utiliser un nombre limité de fréquences à l'intérieur de la bande 862-960 MHz pour communiquer avec les aéronefs dans le cadre d'un réseau du service mobile téléphonique public conformément aux conditions décrites.

Des mesures seront prises pour garantir que les services mentionnées ci-dessus ne causeront pas de brouillage préjudiciable aux services fonctionnant conformément au Tableau d'attribution des bandes de fréquences dans les autres pays.

Nº 34

Pour la République Socialiste Soviétique de Biélorussie, la République Socialiste Soviétique d'Ukraine e t l'Union des Républiques Socialistes Soviétiques

Dans le Tableau d'attribution des bandes de fréquences révisé par la Conférence administrative mondiale des radiocommunications (Génève, 1979), des attributions additionnelles ont été faites au service de radiodiffusion dans la bande des ondes décamétriques, aux dépens des attributions au service fixe.

Etant donné qu'en URSS les stations du service fixe fonctionnent depuis longtemps dans ces bandes de fréquences, les délégations de l'Union des Républiques Socialistes Soviétiques, de la République Socialiste Soviétique d'Ukraine et de la République Socialiste Soviétique de Biélorussie sont autorisées à déclarer qu'en URSS les bandes d'ondes décamétriques attribuées additionnellement en exclusivité au service de radiodiffusion seront aussi utilisées par le service fixe.

Nº 35

Pour la République fédérale d'Allemagne

En signant les Actes finals de la Conférence, la délégation de la République fédérale d'Allemagne déclare que l'attribution révisée du spectre des bandes d'ondes décamétriques au service fixe, au service de radiodiffusion et au service maritime ne répond pas aux besoins de ces services en République Fédérale d'Allemagne, tels qu'ils ont été formulés dans les documents pertinents présentés à la Conférence administrative mondiale des radiocommunications (Génève, 1979).

La solution des problèmes existants est conditionée par un transfert satisfaisant de ces services, et par l'élaboration d'un plan de radiodiffusion à ondes décamétriques, accepté à l'échelon international, permettant, dans les bandes attribuées au service de radiodiffusion, l'inclusion nécessaire de toutes les émissions hors bandes, et répondant aux besoins du service de radiodiffusion à ondes décamétriques de la République fédérale d'Allemagne.

En conséquence, la République fédérale d'Allemagne se réserve le droit, en ce qui concerne le spectre des bandes d'ondes décamétriques de prendre les mesures nécessaires pour faire aux besoins minima de ses services respectifs.

Nº 36

Pour le Royaume de l'Arabie Saoudite, la République de Chypre, l'Espagne, les États-Unis d'Amérique, la Grèce, le Royaume-Uni de Grande-Bretagne et d'Irlande du Nord, la Repúblique Socialiste Démocratique de Sri Lanka et la République de Zambie

Considérant que cette Conférence n'a pas été en mesure de répondre de façon satisfaisante aux besoins du service de radiodiffusion à ondes décamétriques, dans les attributions de bandes de fréquences révisées, notamment dans les bandes des 6 MHz et 7 MHz. Si la Conférence projetée de radiodiffusion à ondes décamétriques n'est pas habilitée, de par son ordre du jour, à disposer de certaines parties du spectre attribuées au service fixe, elle sera dans l'impossiblité de planifier l'utilisation de toutes les bandes de fréquences de manière à permettre aux pays d'assurer leurs services de radiodiffusion en cas de variations des conditions de propagation dans toute l'étendue du cycle d'activité solaire. En l'absence d'un plan adéquat, les Administrations susmentionnées se réservent le droit de prendre les mesures nécessaires pour répondre aux besoins de leurs services de radiodiffusion à ondes décamétriques.

Nº 37

Pour la République de Corée

La délégation de la République de Corée, au nom de son Gouvernement, réserve à celui-ci le droit de prendre telle décision qu'il pourra juger nécessaire pour sauvegarder ses intérêts si d'autres Membres manquent d'observer les dispositions du Règlement des radiocommunications (Génève, 1979), ou de ses Annexes, ou si les réserves formulées par d'autres pays compromettent le bon fonctionnement de ses services de télécommunication.

Nº 38

Pour les États-Unis d'Amérique

La délégation des Etats-Unis d'Amérique déclare officiellement que, en signant les présents Actes finals au nom des États-Unis d'Amérique, elle n'accepte pas certaines décisions prises par la présente Conférence au sujet du Tableau d'attribution des bandes de fréquences et des renvois associés à ce Tableau. En conséquence:

1) Étant donné que la présente Conférence n'a pas prévu d'attributions suffisantes pour le service de radiodiffusion à ondes décamétriques, particulièrement à 6 MHz et 7 MHz, les États-Unis d'Amérique font des réserves sur cette question, comme indiqué dans la déclaration Nº 36, présentée conjointement avec les délégations de l'Arabie Saoudite, de Chypre, de l'Espagne, de la Grèce, du Royaume-Uni de Sri Lanka et de la Zambie;
2) Les États-Unis d'Amérique se réservent le droit d'exploiter des stations du service mobile par satellite dans la gamme de fréquences de 235 MHz à 399,9 MHz, comme indiqué dans la déclaration Nº 32, présentée conjointement avec les délégations de la République fédérale d'Allemagne, de la Belgique, du Danemark, de la Grèce, de l'Islande, de l'Italie, du Luxembourg, de la Norvège, des Pays-Bas, du Portugal, du Royaume-Uni et de la Turquie;
3) Dans l'exploitation des stations du service de localisation, à primaire, dans les bandes 430-440 MHz, 5650-5850 MHz, 8500-8750 Hz, 8850-9000 MHz, 9200-9300 MHz, 9500-9800 MHz, 10 000-10 500 MHz, 13,4-14 GHz, 15,7-17,3 GHz et 33,4-36 GHz, les États-Unis d'Amérique ne peuvent garantir la protection d'autres services, ni la coordination avec d'autres services;
4) Les États-Unis d'Amérique se réservent le droit d'exploiter des stations du service fixe, du service mobile et du service radiolocalisation, à titre primaire, dans les bandes spécifiées dans les renvois relatifs aux bandes de fréquences 470-806 MHz et 890-960 MHz, sans la condition spécifiée dans ces renvois, selon lesquels cette exploitation est sujette à un accord aux termes de l'article 14. Les États-Unis coordenneront l'utilisation de ces services avec les administrations des pays voisins qui sont influencées;
5) Étant donné que la Conférence n'a pas fait d'attributions suffisantes pour le service mobile maritime à ondes décamétriques, en particulier au-dessous de 12 MHz, les États-Unis d'Amérique déclarent leur intention de satisfaire les besoins du service mobile maritime dans les différentes bandes d'ondes décamétriques inférieures à 10 MHz qui ont été attribuées au service mobile à titre primaire.

Nº 39

Pour les États-Unis d'Amérique

L'Administration des États-Unis d'Amérique attire l'attention sur le fait que certaines de ses émissions de radiodiffusion dans les bandes d'ondes décamétriques attribuées au service de radiodiffusion subissent, de la part d'administrations signataires des présents Actes finals, des brouillages préjudiciables intentionnels, brouillages qui sont incompatibles avec l'utilisation rationelle et équitable de ces bandes; elle declare que tant que ces brouillages existeront, elle se réserve le droit de prendre, à leur propos, les mesures nécessaires et appropriées pour protéger les intérêts de ses services de radiodiffusion. Ce faisant, elle entend cependant respecter, dans la mesure du possible, les droits des administrations dont les services sont exploités conformément aux présents Actes finals.

Nº 40

Pour la République de Colombie, la République Populaire du Congo, l'Equateur, la République Gabonaise, la République du Kenya, la République de l'Ouganda, la République Démocratique Somalie et la République du Zaire

Les délégations des pays susmentionnés ratifient, dans toutes ses parties, la réserve Nº 51 formulée lors de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (1977) et elles réitérent par conséquent le contenu de cette réserve pour ce qui a trait à la Conférence administrative mondiale des radiocommunications (Génève, 1979).

De même, les délégations précitées tiennent à affirmer que la Conférence administrative mondiale des radiocommunications (Génève, 1979) n'a pas compétence pour traiter ou décider de questions à caractére territorial, ni d'aspects se rapportant à la souveraineté des États.

D'autre part, les délégations précitées déclarent une fois de plus que la position des pays équatoriaux en ce qui concerne les questions se rapportant aux segments de l'orbite des satellites géostationnaires situés au-dessous de leurs territoires respectifs tend à apporter un bénéfice authentique aux peuples de leurs pays respectifs, à la communauté internationale et, en particulier, aux pays en développement; en même temps, ces délégations expriment leur opposition à la poursuite de l'application du principe «premier venu, premier servi», qui profite uniquement à un petit nombre de pays, bénéficiaire exclusifs de cette ressource naturelle limitée, au détriment des autres membres de la communauté internationale, et, en particulier, des pays en développement.

Enfin, les délégations des pays susmentionnés déclarent officiellement qu'elles n'acceptent pas, et par conséquent qu'elles ne s'estiment pas liées, après la signature des Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979) et en aucune circonstance, par les résolutions, recommandations, accords et décisions de cette Conférence, relatifs au positionnement des satellites géostationnaires sur le segments de l'orbite qui correspondent aux territoires sur lesquels s'exercent les droits souverains de ces pays.

N° 41

Pour la République de Colombie

La délégation de la Colombie à la Conférence administrative mondiale des radiocommunications (Génève, 1979), se réserve le droit, au nom de son Gouvernement, de prendre, quand elle le jugera nécessaire, les mesures appropriées à propos des obrigations qui découlent du Règlement des radiocommunications tel que révisé par la présente Conférence, et en particulier au sujet du transfert des assignations de fréquences aux stations du service fixe dans les parties des bandes d'ondes décamétriques qui ont été attribuées à d'autres services.

De même, la délégation de la Colombie se réserve le droit de continuer à utiliser, à l'intérieur du territoire national, les liaisons du service fixe qui fonctionnent conformément ai Règlement en vigueur et qui, pour des raisons de faisabilité technique, économique ou autres, ne peuvent être transférées dans les délais prévus à la présent Conférence.

N° 42

Pour la République d'Indonésie

La délégation de la République d'Indonésie à la Conférence administrative mondiale des radiocommunications (Génève, 1979):

a) Réserve à son Gouvernement le droit de prendre toute décision et toute mesure conservatoire visant à sauvegarder ses intérêts pour le cas où les Actes finals élaborés par la présente Conférence se trouveraient en contravention avec la Constitution, les lois et les droits de la République d'Indonésie, tels qu'ils existent actuellement ou qu'ils pourraient découler des principes formulés le 3 décembre 1976 dans la Déclaration de Bogota par les pays équatoriaux, ainsi que de tout autre principe du droit international. Ce faisant, le Gouvernement de la République d'Indonésie tiendra compte des intérêts légitimes des autres pays afin de promouvoir la coopération internationale en ce qui concerne les utilisations pacifiques de l'espace pour le bien de l'ensemble de l'humanité;

b) Réserve également le droit de son Gouvernement de prendre toute décision et toute mesure conservatoire visant à sauvegarder ses intérêts pour le cas où des Membres de l'Union manqueraient d'observer les dispositions des Actes finals de la Conférence ou pour celui où des réserves formulées par d'autres Membres viendraient à compromettre ses droits au titre des Actes finals.

N° 43

Pour l'Autriche

En signant les Actes finals de la Conférence, la délégation de l'Autriche désire faire la déclaration suivante:

L'Autrich n'approuve pas les attributions des bandes d'ondes décamétriques 5850-5950 kHz et 7300-7400 kHz aux services fixe et mobile, étant donné qu'il n'existe aucune attribution additionnelle au service de radiodiffusion dans les bandes des 6 MHz et des 7 MHz.

En conséquence, l'Administration autrichienne estime que la Conférence de radiodiffusion à ondes décamétriques proposée ne sera pas en mesure de planifier toutes les bandes de fréquences de manière à permettre aux pays d'assurer un fonctionnement régulier de leurs services de radiodiffusion, eu égard aux conditions de propagation variables au cours du cycle solaire.

De ce fait, la délégation autrichienne réserve à son Administration le droit de prendre les mesures nécessaires afin de sauvegarder les intérêts de ses services de radiodiffusion à ondes décamétriques. Ce faisant, l'Administration autrichienne tiendra compte, dans la mesure du possible, des intérêts des services d'autres pays.

Nº 44

Pour la République Populaire d'Angola

La délégation de la République Populaire d'Angola réserve à son Gouvernement le droit de prendre toutes mesures qu'il estime nécessaires pour protéger les intérêts de ses télécommunications si certains Membres n'observent pas les dispositions du Règlement des radiocommunications ou si des réserves formulées par d'autres pays compromettaient le bon fonctionnement de ses services de télécommunications.

Nº 45

Pour la République Argentine

A) La délégation de la République Argentine déclare que son Gouvernement se réserve le droit d'adopter les mesures qu'il jugera pertinentes pour assurer le bon fonctionnement de ses services de télécommunications si ses intérêts étaient compromis par les décisions de la présente Conférence, notamment en ce qui concerne l'application de la procédure de libération de parties de la bande attribuée au service fixe dans les ondes décamétriques entre 4000 kHz et 27 500 kHz et du transfert des stations dudit service des parties de la bande en question à d'autres bandes de fréquences.

De même, la délégation de l'Argentine déclare que si les réserves formulées par d'autres pays portent préjudice à ses services de télécommunications, la République Argentine se réserve le droit de prendre les dispositions nécessaires pour protéger ses services.

B) La délégation de la République Argentine déclare que son Gouvernement ne reconnaît pas les assignations de fréquence qui peuvent être faites directement ou indirectement pour tous les services, dans toute partie du spectre radioélectrique, en ce qui concerne les îles Malouines. L'île de la Géorgie du Sud, les îles Sandwich du Sud et l'Antarctique argentin entre 25° et 74° de longitude à l'ouest de Greenwich, au sud de 60° de latitude Sud du Pôle Sud, si ces assignations sont faites au nom d'un ou de plusieurs autres États alors que la République Argentine exerce les droits de souveraineté sur ces territoires. De toute manière, la République Argentine se réserve le droit d'utiliser à son compte les fréquences radioélectriques assignées dans les conditions précitées.

C) Au nom de son Gouvernement, la délégation de la République Argentine déclare que l'occupation illicite des Îles Malouines, des îles de la Géorgie du Sud et Sandwich du Sud par le Royaume-Uni a été reconnue par l'Organisation des Nations Unies qui dans ses Résolutions 2065 (XX), 3160 (XXVIII) et 31/49, a demandé instamment que les négociations entre les deux Gouvernements soient activées afin de mettre un terme à une situation de type colonial.

Nº 46

Pour la République Démocratique Populaire du Yémen

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République Démocratique Populaire du Yémen, tout en réaffirmant son soutien à la coopération internationale dans le domaine des télécomunnications, réserve à son Gouvernement le droit de prendre toutes mesures qu'il estimera nécessaires pour protéger ses iontérêts si un pays manque, de quelque manière que ce soit, d'observer les dispositions des Actes finals de la Conférence susmentionnée ou si des réserves formulées par d'autres pays compromettent ses services de télécommunications.

Nº 47

Pour la République d'Iraq et la République Arabe Syrienne

Les Administrations des pays susmentionnés confirment que, conformément à la Résolution 1, l'IFRB ne devrait accepter aucune notification d'assignation de fréquences à des stations situées dans un territoire occupé, lorsque ces notifications sont présentées par l'Administration du pays occupant.

Nº 48

Pour l'Irlande et le Royaume-Uni de Grande-Bretagne et d'Irlande du Nord

Etant donné qu'il n'a pas été possible, à la présente Conférence, d'obtenir l'inclusion de l'Irlande dans le renvoi 621, les délégations susmentionnées déclarent que leurs Administrations appliqueront le Règlement des radiocommunications comme si l'Irlande avait été mentionnée dans ledit renvoi.

Nº 49

Pour la République Unie de Tanzanie

Le Gouvernement de la République Unie de Tanzanie se réserve le droit de prendre toute décision qu'il jugera nécessaire pour protéger ses intérêts, si des Membres manquent, de quelque manière que ce soit, d'observer les disposi-

tions du Règlement des radiocommunications (Conférence administrative mondiale des radiocommunications, (Génève, 1979) ou si des réserves formulées par d'autres pays compromettent le bon fonctionnement de ses services de radiocommunication.

N° 50

Pour la République Populaire du Mozambique

La délégation de la République Populaire du Mozambique réserve le droit de son Gouvernement de prendre toutes les mesures nécessaires pour protéger ses intérêts si un pays manque d'observer les dispositions du Règlement des radiocommunications elaboré par la Conférence administrative mondiale des radiocommunications (Génève, 1979), ou si les réserves formulées par un pays quelconque tendent à compromettre le bon fonctionnement de ses services de télécommunications.

N° 51

Pour la República de Zambie

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République de Zambie réserve à son Gouvernement le droit de prendre toutes mesures qu'il jugera nécessaires pour protéger ses intérêts en matière de télécommunications si un Membre quelconque de l'UIT n'observe pas, de quelque manière que ce soit, les dispositions du Règlement des radiocommunications.

N° 52

Pour la République du Niger

A la lumière des réserves déjà déposées, la délégation du Niger à la Conférence administrative mondiale des radiocommunications (Génève, 1979) réserve le droit de son Gouvernement de prendre toutes mesures utiles protéger ses intérêts en matière de radiocommunications du fait de non respect des dispositions des Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979) et du Règlement des radiocommunications issu de ladite Conférence.

N° 53

Pour la République Populaire du Congo

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation Congolaise prend note avec appréhension des réserves formulées par l'autres délégations en ce qui concerne l'utilisation et l'application du Règlement des radiocommunications.

En conséquence, la délégation de la République Populaire du Congo réserve à son Gouvernement le droit de prendre des mesures nécessaires pour la sauvegarde de ses intérêts dans le cas où les pays signataires des Actes finals n'observeraient pas les dispositions du Règlement des radiocommunications ou, si les réserves formulées par les délégations d'autres pays compromettaient le bon fonctionnement de ses services de radiocommunications.

N° 54

Pour la République Populaire Révolutionnaire de Guinée

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République Populaire et Révolutionnaire de Guinée a noté avec appréhension des réserves faites par certains membres, notamment en ce qui concerne les attribuitions au Tableau d'attribution des bandes de fréquences et le respect des dispositions du Règlement des radiocommunications.

En conséquence, elle réserve à son Gouvernement le droit de prendre toutes les mesures qu'il jugera utiles pour sauvegarder ses intérêts en matière de télécommunications.

N° 55

Pour la République Socialiste Democratique de Sri Lanka

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République Socialiste Démocratique de Sri Lanka a noté que plusieurs administrations ont émis des réserves concernant diverses dispositions des Actes finals de la Conférence chargée de remanier le Règlement des radiocommunications.

La délégation de la République Socialiste Démocratique de Sri Lanka réserve donc à son Gouvernement, le droit de prendre toutes mesures qu'il jugera nécessaires pour protéger ses intérêts, au cas où les réserves en question porteraient gravement préjudice aux services de télécommunications de la République Socialiste Democrátique de Sri Lanka.

N° 56

Pour la República Centrafricaine

La délégation de la République Centrafricaine a noté avec appréhension certaines des réserves déjà déposées et portant sur l'application des dispositions du Règlement des radiocommunications et notamment du Tableau d'attribution des bandes de fréquences. En conséquence, elle réserve à son Gouvernement de droit de prendre toutes les mesures qu'il jugera nécessaires pour protéger ses services des télécommunications et d'approuver le nouveau Règlement des radiocommunications.

N° 57

Pour le Ghana

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation du Ghana apris note de diverses réserves formulées par d'autres pays et est très préoccupée par les attributions le fréquence et les nouveaux renvois.

La délégation du Ghana réserve à son Gouvernement le droit du protéger ses intérêts en matière de télécomunications et n'accepte aucune des conséquences des réserves, formulées par d'autres Gouvernements, qui pourraient entraîner un accroissement de sa participation aux dépenses de l'Union.

N° 58

Pour la République Socialiste de Roumanie

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République Socialiste de Roumanie a noté avec inquiétude les réserves formulées par d'autres pays en ce qui concerne notamment les attributions inscrites dans le Tableau d'attribution des bandes de fréquences ainsi que l'application du Règlement des radiocommunications.

La délégation de la République Socialiste de Roumanie réserve donc à son Gouvernement le droit de prendre toutes mesures qu'il jugera nécessaires pour protéger ses intérêts, au cas où les réserves susmentionnées porteraient préjudiciable à ses services de télécommunications.

N° 59

Pour la République du Libéria

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République du Libéria prend note avec préocupation des réserves formulées par d'autres pays, en ce qui concerne aussi bien les attributions inscrites dans le Tableau d'attribution des bandes de fréquences que l'application du Règlement des radiocommunications.

La délegation de la République du Libéria réserve donc à son Gouvernement le droit de prendre telles mesures qu'il jugera nécessaires pour protéger ses intérêts, au cas où ces réserves porteraient préjudice à ses services de télécommunications.

N° 60

Pour la Thaïlande

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la Thaïlande fait la déclaration suivante au nom de son Gouvernement:

a) Elle observe que de nombreux pays se réserve le droit d'utiliser les portions de bandes 5850-5950 kHz et 7300-7400 kHz pour des services de radiodiffusion;

b) Elle n'accept pas les réserves formulées par d'autres pays en ce qui concerne l'utilisation des portions de bandes 5850-5950 kHz et 7300-7400 kHz pour des services de radiodiffusion et réserve à son Gouvernement le droit de prendre toute mesure ferme qu'elle pourra juger nécessaire afin de protéger ses services de télécommunications;

c) Elle réserve à son Gouvernement le droit d'exploiter des stations du service mobile, sauf mobile aéronautique, à titre primaire dans la bande 435-438 MHz et prendra les mesures nécessaires pour as-

surer que les services fonctionnant conformément au Tableau d'attribution des bandes de fréquences dans l'autres pays ne subissent aucun brouillage préjudiciable du fait de service mentionné.

N° 61

Pour la République Unie du Cameroun

Au moment de signer les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République Unie du Cameroun a noté avec une grande préoccupation les réserves faites par d'autres pays portant sur des attributions faites dans le Tableau d'attribution des bandes de fréquences et portant aussi sur l'application du Réglement des radiocommunications.

La délégation de la République Unie du Cameroun réserve, en conséquence, le droit à son Gouvernement, de prendre toutes les mesures jugées nécessaires pour sauvegarder ses intérêts au cas où les réserves susmentionnées porteraient préjudice à ses services des télécommunications.

N° 62

Pour Maurice

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de Maurice prend note avec préoccupation des réserves formulées par d'autres délégations, en particulier en ce qui concerne aussi bien, les attributions inscrites dans le Tableau d'attribution des bandes de fréquence que l'aplication du Règlement des radiocommunications.

En conséquence, la délégation de Maurice réserve à son Gouvernement le droit de prendre toute mesure qu'il jugera nécessaire pour protéger les intérêts de son service de radiodiffusion et des autres services de télécommunication, au cas où ces réserves compromettraient de quelque manière que ce soit, le bon fonctionnement de ces services.

N° 63

Pour la République de Singapour

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), et après avoir pris note des réserves déposées par d'autres délégations, en particulier en ce qui concerne le Tableau d'attribution des bandes de fréquences, la délégation de la République de Singapour réserve à son Gouvernement le droit de prendre toute mesure qu'il jugera nécessaire pour protéger ses intérêts, si un Membre manque, de quelque manière que ce soit, d'observer les dispositions du Règlement des radiocommunications établi par ladite Conférence, où si les réserves susmentionnées compromettent le bon fonctionnement de ses services de télécommunications.

N° 64

Pour la République des Philippines

La délégation de la Rèpublique des Phillipines, après avoir apris notes des réserves formulées par certaines délégations en particulier en ce qui concerne l'utilisation du sprectre des fréquences, réserve à son Gouvernement le droit de prendre, le cas échéant, toute mesure qui pourrait être nécessaire pour protéger ses intérêts si des Membres manquent d'observer les dispositions des Actes finals de la présente Conférence de leurs annexes ou du protocole y attaché, où si les réserves formulées par d'autres pays peuvent avoir des conséquences préjudiciables aux intérêts des Philippines.

N° 65

Pour le Costa Rica

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation du Costa Rica déclare que son Administration s'efforcera de respecter les dispositions du Règlement des radiocommunications adopté au cours de la presente Conférence; néanmoins, compte tenu des réserves formulées par certains pays, elle réserve à son Gouvernement le droit:

a) D'adopter les mesures nécessaires pour protéger les services de radiocommunications du Costa Rica, au cas où la non-observation du Règlement, de ses annexes et protocoles associés par d'autres pays Membres de l'Union porterait préjudice au fonctionnement de ces services;

b) De ne pas accepter les réserves formulées par les différents pays qui ne protègent pas les services fixe et mobile, étant donné que, surtout dans les bandes d'ondes décimétriques, lesdits services ont une importance capitale pour le Costa Rica et qu'ils doivent être protégés contre tous les types de brouillages.

Nº 66

Pour l'Equateur

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de l'Equateur déclare que son Administration s'efforcera de respecter toutes les dispositions du Règlement qui a été adopté à la présent Conférence; néanmois, compte tenu des réserves formulées par d'autres paysm elle réserve à son Gouvernement le droit:

a) D'addopter les mesures qu'elle jugera nécessaires pour protéger les services de télécommunications de l'Equateur, au cas où la non-observation du Règlement et de ses annexes par d'autres pays Membres de l'Union porterait préjudice au fonctionnement de ces services;
b) De ne pas accepter les réserves formulées par d'autres pays, si elles contreviennent aux intérêts nationaux de l'Equateur;
c) De continuer á utiliser certaines des assignations actuelles des services fixe et mobile à ondes décamétriques si, pour des raisons techniques, économiques ou autres, il n'est pas possible d'en effectuer le transfert dans les délais prévus à la présente Conférence.

Nº 67

Pour la République de Haute-Volta

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République de Haute-Volta a noté avec appréhension les réserves formulées par certains pays au sujet de certaines dispositions du Règlement des radiocommunications.

En conséquence, elle réserve á son Gouvernement le droit de prendre les mesures qu'il jugera nécessaires pour sauvegarder ses intérêts dans le cas où ces-ci viendraient à être compromis.

Nº 68

Pour le Royaume Hachémite de Jordanie, le Liban et la République Arabe Syrienne

Les délégations précitées à la Conférence administrative mondiale des radiocommunications (Génève, 1979), se déclarent solennellement liées par les dispositions adoptées par la présente Conférence, conformément aux dispositions de la Convention internationale des télécomunications.

En conséquence, elles rejettent toutes déclarations ou mesures qui ne soit pas conformes aux décisions prises par ladite Conférence.

En particulier, elles déclarent que la déclaration figurant dans la réserve Nº 30 à propos des renvois relatifs aux bandes 174-223 MHz et 15,7-17,3 GHz est inacceptable, car elle est contraire aux décisions prises par la Conférence, laquelle pleinement reconnu le bien fondé des objections d'ordre technique formulées par la délégation du Royaume Hachémite de Jordanie contre l'inclusion d'Israël dans les renvois en question.

Nº 69

Pour la République du Kenya

En raison des réserves déposées par certains pays cherchant à exploiter certains services en violation des dispositions du Règlement des radiocommunications établi par la Conférence administrative mondiale des radiocommunications (Génève, 1979), la délégation de la République du Kenya réserve á son Gouvernement le droit de prendre les mesures qu'il pourra juger nécessaires pour protéger ses services de télécommunication si d'autres Membres manquent d'observer les dispositions du Règlement des radiocommunications, tel qu'il a été révisé par la présente Conférence, en particulier du fait des réserves Nºs 13, 32, 33, 36, 38 et 43 contenues dans le Protocole final.

Nº 70

Pour la République Islamique d'Iran

La délégation de la République Islamique d'Iran déclare que son Administration n'accepte aucune conséquence des réserves formulées par toute autre administration ou groupe d'administrations á propos des dispositions des Actes

finals. La délègation de la République Islamique d'Iran réserve pour son pays le droit qu'a son Gouvernement de prendre toutes mesures qu'il pourra juger nécessaires pour protéger ses intérêts si une autre administration, notamment en conséquence de l'une des réserves N.os 11, 32, 34 ou 38 du Protocole final, passait outre aux dispositions du Règlement des radiocommunications révisé par la présente Conférence ou les enfreindrait et plus particulièrement si de tels actes portaient préjudice aux besoins ou aux intérêts de la République Islamique d'Iran.

Nº 71

Pour la République du Mali

Après avoir note des réserves déposées par d'autres délégations notamment celles portant sur le Tableau d'attribution des bandes de fréquences, la délégation de la République du Mali réserve à son Gouvernement le droit de prendre toutes les mesures qu'il estimerait nécessaires pour sauvegarder ses intérêts si ces réserves ou le non respect des dispositions du Règlement des radiocommunications tendaient à compremettre le bon fonctionnement de ses services de radiocommunications.

Nº 72

Pour les États-Unis d'Amérique

En référence à la reserve Nº 9 du Gouvernement de la République de Cuba, le Gouvernement des États-Unis d'Amérique note que la presence des États-Unis à Guantanamo est conforme à un traité en vigueur; les États-Unis se réservant le droit de répondre comme par le passe à leurs besoins de radiocommunications à Guantanamo.

Nº 73

Pour la Belgique, la France, le Luxemburg, le Royaume des Pays-Bas et la Confédération Suisse

Les délégations des pays susmentionnés prenant note des réserves exprimées par plusieurs délégations au sujet des attributions insuffisantes faites au service de radiodiffusion dans la partie inférieure de la bande des ondes décamétriques et des mesures que leurs Administrations respectives se proposent de prendre par voie de conséquence, déclarent que leurs Administrations se réservent le droit de prendre toute mesure nécessaire tant pour le fonctionnement satisfaisant des services auxquels cette portion du spectre est attribuée que pour leur permettre un usage équitable de la bande décamétrique poour leur service de radiodiffusion.

Nº 74

Pour la République Algérienne Démocratique et Populaire, le Royaume de l'Arabie Saoudite, l'État de Bhareïn, les Emirats Arabes Unis, la République d'Iraq, le Royaume Hachémite de Jordanie, l'État de Koweït, le Liban, la Lybie (Jamahiriya Arabe Libyenne Populaire Socialiste), le Royaume du Maroc, le Sultanat d'Oman, l'État du Qatar, la République Arabe Syrienne, la République Démocratique Somalie, la République Démocratique du Sudan et la République Démocratique Populaire du Yémen.

Après avoir pris note des réserves déjà déposées, les délégations des pays précités réservent les droits de leurs Gouvernements de prendre telles mesures qu'ils jugeront nécessaires pour protéger leurs intérêts, si un ou plusieurs Membres de l'Union manquent d'observer le dispositions des Actes finals de la Conférence mondiale des radiocommunications (Génève, 1979), ou si les réserves formulées par ces Membres portaient préjudice à leurs services de télécommunications.

Nº 75

Pour la République fédérale d'Allemagne, l'Australie, l'Autriche, la Belgique, le Canada, le Danemark, les États-Unis d'Amérique, la Finlande, la France, la Grèce, l'Irlande, l'Italie, le Japon, la Principauté de Liechtenstein, le Luxemburg, la Norvège, la Nouvelle-Zélande, Papua-Nouvelle-Guinée, le Royaume des Pays-Bas, le Portugal, le Royaume-Uni de Grande-Bretagne et d'Irlande du Nord, la Suède et la Confédération Suisse.

Les délégations précitées, se référant aux réserves formulées par la République de Colombie, la République Populaire du Congo, l'Equateur, la République Gabonaise, la République du Kenya, la République de l'Ouganda, la République Démocratique Somalie et la République du Zaïre dans la Déclaration Nº 40 et celle de la République d'Indonésie dans la Déclaration Nº 42, estiment que dans la mesure où ces deux déclarations se réfèrent à la Déclaration de Bogota du 3 décembre 1976 par les pays équatoriaux et à leurs revendications sur l'exercice de droits de souveraineté sur des sections de l'orbite des satellites géostationnaires, lesdites revendications ne peuvent pas être reconnues par la présente Conférence et que les décisions adoptées par elle au sujet de l'assignation et de l'utilisation des fréquences et de positions orbitales sur l'orbite des satellites géostationnaires sont pleinement conformes à la Convention internationale des télécommunications (Malaga-Torremolinos, 1973) qui lie la présent Conférence.

Les délégations susmentionnées souhaitent également déclarer que la Résolution 3, en ce référent aux «questions techniques pertinentes relatives à la situation géographique particulière de certains pays», n'implique pas la reconnaissance de revendications concernant tout droit préférentiel à l'orbite des satellites géostationnaires.

Nº 76

Pour le Royaume-Uni de Grande-Bretagne et d'Irlande du Nord

Se référent à la déclaration faite par la République de l'Argentine dans le numéro 45 du Protocole final, le Gouvernement du Royaume-Uni de Grande-Bretagne et d'Irlande du Nord ne doute pas de la souveraineté du Royaume-Uni sur les îles Falkland et leurs dépendances et sur le Territoire antarctique britannique. A cet égard, il convient d'appeler l'attention sur l'article IV du Traité de l'Antarctique auxquels sont partie le Royaume-Uni et l'Argentine, qui bloque les prétentions territoriales dans l'Antarctique.

Le Gouvernement Royaume-Uni n'accepte donc pas la déclaration de la République d'Argentine qui conteste la souveraineté du Royaume-Uni sur les territoires ci-dessus mentionnés. En outre, le Royaume-Uni a le droit d'avoir des fréquences assignées à ses services de radiocommunications fonctionnant à partir desdits territoires et considérerait toute utilisation par la République Argentine de fréquences causant des brouillages préjudiciables auxdites assignations comme une violation de la Convention et du Règlement des radiocommunications. Le Royaume-Uni n'accepte pas l'assertion contenue au dernier paragraphe de la déclaration de l'Argentine et selon laquelle «l'occupation illicite des îles Falkland, des îles de la Géorgie du Sud et aux îles Sandwich du Sud par le Royaume-Uni a été reconnue par l'Organisation des Nations Unies». Les Résolutions des Nations Unies ont simplesment demandé le règlement du différend par négociation entre les deux Gouvernements.

Nº 77

Pour le Royaume-Uni de Grande-Bretagne et d'Irlande du Nord

Se référant à la déclaration faite par la République du Guatemala dans le numéro 2 du Protocole final, le Gouvernement du Royaume-Uni de Grande-Bretagne et d'Irlande du Nord n'a aucun doute en ce qui concerne la souveraineté du Royaume-Uni sur Belize et tient à réserver officiellement ses droits à ce sujet.

Nº 78

Pour le Royaume-Uni de Grande-Bretagne et d'Irlande du Nord

La délégation du Royaume-Uni de Grande-Bretagne et d'Irlande du Nord n'accepte pas le numéro 7 du Protocole final, du Chili, dans la mesure où celui-ci conteste la souveraineté du Gouvernement de sa Majesté, au Royaume-Uni, sur le territoire antarctique britannique. La délégation note la référence à l'article IV du Traité de l'Antarctique qui bloque les prétentions territoriales dans l'Antarctique.

Nº 79

Pour la République de Colombie, la République Populaire du Congo, l'Equateur, la République Gabonaise, la République du Kenya, la République de l'Ouganda, la République Démocratique Somalie et la République du Zaïre

Les délégations des pays susmentionnés font observer que le point *e*) et la deuxième partie du paragraphe 3.2 du dispositif de la Résolution 3 approuvée par la Conférence administrative mondiale des radiocommunications (Génève, 1979), se réfèrent aussi à la situation géographique particulière des pays équatoriaux, en ce qui concerne l'orbite des satellites géostationnaires, ainsi qu'il ressort du déroulement des débats qui ont eu lieu au sein du Groupe de travail ad hoc et de la Commission qui ont traité de ce sujet.

Cela étant entendu, les délégations susmentionnées ont accepté les termes de la Résolution précitée, qui traite de l'utilisation de l'orbite des satellites géostationnaires, compte tenu — et il ne saurait en être autrement — des circonstances pertinents découlant de la situation géographique particulière des pays dont le territoire est traversé par l'équateur terrestre.

En conséquence, quelle que soit la planification ou la réglementation tendant à rationaliser l'utilisation de l'orbite des satellites géostationnaires par l'accès équitable de tous les pays à cette orbite, il faudra tenir compte des considérations que les pays équatoriaux ont formulées à cet égard.

Nº 80

Pour Papua-Nouvelle-Guinée

En signant les Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), le délégation de Papua-Nouvelle-Guinée réserve à son Gouvernement le droit de prendre troutes mesures qu'il jugera nécessaires pour sauvegarder les intérêts de ses services de radiocommunication si d'autres pays manquent d'observer les dispositions

adoptées par la Conférence et causent, de ce fait, des brouillages préjudiciables aux systèmes de radiocommunication relevant du Gouvernement de Papua-Nouvelle-Guinée.

N° 81

Pour le Japon

En ce qui concerne les réserves formulées par la délégation chilienne et par la délégation argentine su sujet des assignations de fréquences dans l'Antarctique, la délégation du Japon réaffirme la positions du Gouvernement japonais au sujet de l'article 4 du Traité de l'Antarctique.

N° 82

Pour la République Démocratique Somalie

La délégation de la République Démocratique Somalie à la Conférence administrative mondiale des radiocommunications (Génève, 1979) déclare que son Gouvernement n'acceptera jamais des mesures ou des situations quelconques qui, résultant de réserves déjà déposées par d'autes administrations, pourraient compromettre eles intérêts des services de télécommunication de la Somaile.

N° 83

Pour Cuba

Si, à la suite des réserves formulées dans les numéros 36 et 38 du Protocole final de la Conférence administrative mondiale des radiocommunications (Génève, 1979), en ce qui concerne l'utilisation du service de radiodiffusion dans les bandes attribuées à d'autres services que le service précité, au voisinage de 6 MHz et de 7 MHz, ces nouvelles bandes ne peuvent être utilisées de manière appropriée par les services auxquels elles sont attribuées, l'Administration de la République de Cuba, se réserve le droit de les utiliser de la façon qui répond le mieux à ses intérêts.

(Suivent les signatures.)

RÉSOLUTIONS

Note du Secrétaire général

En application des décisions prises par la Conférence, les Résolutions ont été classées et numérotées dans les catégories et selon le système de numérotation indiqués ci-dessous. En outre, dans l'application de ce processus de classification, il est apparu que cetaines Résolutions faisant partie d'un groupe donné étaient en rapport direct avec des Résolutions figurant dans d'autres groupes; il a été tenu compte de ce fait, afin de faciliter la consultation des textes.

	Numéros
Resolutions d'application générale	1–99

CA

RÉSOLUTION Nº 1

Relative à la notification des assignations de fréquence (1)

La fréquence administrative mondiale des radiocommunications (Génève, 1979),

se référant

Au Préambule de la Convention (2);
À l'article 31 de la Convention (2) (Arrangements particuliers);
À l'article 7 du Règlement des radiocommunications (Accords particuliers);
À l'article 12 du Règlement des radiocommunications (Notification et inscription dans le Fichier de référence international des fréquences des assignations de fréquence aux stations de radiocommunications de Terre);
À l'article 13 du Règlement des radiocommunications (Notification et inscription dans le Fichier de référence international des fréquences des assignations de fréquence aux stations de radioastronomie et aux stations de radiocommunication spatiale à l'exception des stations du service de radiodiffusion par satellite);
À l'article 17 du Règlement des radiocommunications (Procédure relative aux bandes attribuées en exclusivité au service de radiodiffusion emtre 5950 kHz et 26 100 kHz);

décide

que, sauf indication contraire spécifiquement stipulée dans des arrangements particulieres communiqués à l'union par les administrations, toute notification d'une assignation de fréquence à une station doit être faite par l'administration du pays sur le territoire duquel la station est située.

AY

RÉSOLUTION Nº 2

Relative à l'utilisation équitable par tous les pays, avec égalité de droits, de l'orbite des satellites géostationnaires et des bandes de fréquences attribuées aux services de radiocommunication spatiale (3)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considéran

que tous les pays ont les mêmes droits d'utiliser les fréquences radioélectriques attribuées aux différents services de radiocommunication spatiale ainsi que, pour ces services, l'orbite des satellites géostationnaires;

tenant compte du fait

que le spectre des fréquences radioélectriques et l'orbite des satellites géostationnaires constituent des ressources naturelles limitées et qu'il convient de les utiliser de la manière la plus efficace et économique possible;

consciente du fait

que l'utilisation, par les différents pays ou groupes de pays, des bandes de fréquences attribuées ainsi que d'emplacement fixes sur l'orbite des satellites géostationnaires peut commencer à des dates différentes, selon les besoins de ces pays et selon les moyens techniques dont ils pourront disposer;

décide

1. Que l'enregistrement à l'IFRB des assignations de fréquence pour les services de radiocommunication spatiale et l'utilisation de ces assignations ne sauraient conférer une priorité permanente à tel ou tel pays ou groupe d epays et faire obstacle à la création de systèmes spatiaux par d'autres pays;
2. Qu'en conséquence, il convient qu'un pays ou groupe de pays au nom duquel des assignations de fréquence ont été enregistrées par l'IFRB pour ses services de radiocommunication spatiale prenne toutes les mesures pratiquemnt possibles pour laisser à d'autres pays ou groupes de pays qui le désirent la possibilité d'utiliser de nouveaux systèmes spatiaux;
3. Qu'il convient que les administrations et les organismes permanents de l'Union tiennent compte des dispositions contenues dans les paragraphes 1 et 2 de la présente Résolution.

---

(1) Remplace de la Résolution Nº 5 de la Conférence administrative des radioconmunications (Génève, 1959).
(2) Convention internationale des télécommunications (Malaga-Torremolinos, 1973).
(3) Remplace de la Résolution Nº Spa2-1 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

BP RÉSOLUTION Nº 3

Relative à l'utilisation de l'orbite des satellites géostationaires et à la planification des services spatiaux utilisant cette orbite

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que l'orbite des satellites géostationnaires et le spectre des fréquences radioélectriques sont des ressources naturelles limitées et qu'ils sont utilisés par les services spatiaux;
b) Qu'il est nécessaire d'assurer l'accès équitable à ces ressources et leur utilisation efficace et économique par tous les pays, comme le prévoient l'article 33 de la Convention internationale des télécommunications (Malaga-Torremolinos, 1973) et la Résolution 2;
c) Que différents pays ou groupes de paus peuvent utiliser les fréquences radioélectriques et l'orbite des satellites géostationnaires à des époques différentes, leon leurs besoins et les ressources dont ils disposent;
d) Que, dans le monde entier, les besoins d'assignations de position orbitale et de fréquence pour les services spautiaux sont de plus nombreux;
e) Qu'il conviendrait, en ce qui concerne l'utilisation de l'orbite des satellites géostationnaires par des services spatiaux, de prêter attention aux questions techniques pertinents relatives à la situation géographique particuliére de certains pays;

décide

1. Qu'une conférence administrative mondiale des radiocommunications spatiales sera convoquée en 1984 au plus tard afin de garantir concrétement à tous les pays un accès équitable à l'orbite des satellites géostationnaires et aux bandes de fréquences attribuées aux services spatiaux;
2. Que cette conférence se tiendra en deux sessions;
3. Que la première session devra:
3.1. Décider de services spatiaux et des bandes de fréquences pour lesquels il convient d'établir des plans;
3.2. Définir les principes, les paramètres techniques et les critères applicables à la planification notamment en ce qui concerne les assignations d'orbite et des fréquence pour les services spatiaux ainsi que les bandes de fréquences visées au paragraphe 3.1, en tenant compte des questions techniques pertinentes relatives à la situation géographique particuliére de certains pays; fournir en outre des principes directeurs concernant les procédures réglementaires associées;
3.3. Élaborer les principes directeurs en matière de procédures réglementaires applicables aux services et aux bandes de fréquences qui ne sont pas visées au paragraphe 3.2;
3.4. Examiner d'autres qui permettraient d'attreindre l'objectif ennocé au point 1 du dispositif;
4. Que la seconde session aura lieu au plus tôt douze mois et au plus tard dix-huit mois après la première session afin de mettre en œuvre les décisions prises lors de la premiére session;

invite

1. *Le CCIR* à effectuer des études préparatoires et à fournir à la première session de la conférence des renseignements techniques concernant les principes, les critères et les paramètres techniques, y compris ceux dont on a besoin pour la planification des services spatiaux;
2. *L'IFRB* à préparer un rapport sur la mise en application des procédures des articles 11 et 13, comprenant des renseignements sur les difficultés éventuellement signalées à l'IFRB par les administrations qui cherchent à obtenir l'accès à des positions orbitales et des fréquences appropriées et à distribuer ce rapport aux administrations au moins un an avant la première session de la conférence;
3. *L'IFRB* à se charger de la préparation technique de la conférence, conformément aux dispositions du Règlement des radiocommunications;
4. *Les admninistrations* à examiner tous les aspects de la question, afin de soumettre des propositions à la conférence et à coopérer activement aux travaux susmentionnée du CCIR et de l'IFRB;
5. *Le Conseil d'administration* à prendre toutes les mesures nécessaires en vue de la convocation de la conférence conformément à la présente Résolution.

BY RÉSOLUTION Nº 4

Relative à la durée de validité des assignations de fréquence aux stations spatiales utilisant l'orbite des satellites géostationnaires

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il est nécessaire d'utiliser de façon rationnelle et efficace le spectre des fréquences et l'orbite des satellites géostationnaires et qu'il convient de prendre en considération les dispositions de la Résolution **2** relative à

l'utilisation par tous les pays avec égalité de droits, des bandes de fréquences attribuées aux services de radiocommunication spatiale;

b) Que la limitation de la durée de validité des assignations de fréquence aux stations spatiales utilisant l'orbite des satellites géostationnaires relève d'une notion qui pourrait permettre de se rapprocher des objectifs susmentionnés;

c) Que l'amortissement des investissements considérables effectués pour le développement des radiocommunications spatiales, constitue une charge particulièrement lourde pour toutes les administrations et que ces investissements doivent être étalés sur une période prédéterminée;

d) Que l'on doit s'efforcer d'inciter les administrations qui en ont le possibilité à développer des techniques destinées à améliorer l'utilisation du spectre des fréquences et de l'orbite des satellites géostationnaires en vue d'accroître la masse des moyens de radiocommunication mis à la disposition de la communauté mondiale;

e) Qu'une conférence administrative mondiale des radiocommunications spatiales doit, vers 1984, traiter de l'utilisation de l'orbite des satellites géostationnaires et la planification des services spatiaux utilisant cette orbite;

f) Qu'il serait utile d'établir, à titre expérimental, une procédure permettant de tirer des enseignements de l'application de la nouvelle notion de notification de la durée de validité d'une assignation dans les radiocommunications spatiales, mais qu'il n'est pas souhaitable d'imposer aux administrations une durée fixée réglementairement et identique dans tous les cas, et qu'il faut au contraire laisser le soin aux administrations de proposer elles-mêmes en fonction de leurs besoins et de l'intérêt général cette durée de validité;

décide

1. Que, entre le 1er juillet 1980 et la conférence administrative mondiale des radiocommunications spatiales (voir le Résolution **3**), les assignations de fréquence à des stations de radiocommunication spatiale situées sur l'orbirte des satellites géostationnaires seront traitées comme suit:

1.1. Une assignation de fréquence à une station spatiale (1) instalée à bord d'un satellite géostationnaire est réputée être abandonnée définitivement au-delà de la durée de fonctionnement indiquée sur la fiche de notification, comptée à partir de la date de la mise en service de cette assignation. Cette période est limitée à celle pour laquelle le réseau à satellite a été conçu. Le Comité invite alors l'administration notificatrice à procéder à l'annulation de cette assignation. Si, dans un délai de trois mois suivant l'expiration de cette durée de fonctionnement, le Comité n'a pas reçu de réponse, il insère un symbole dans le collonne Observations du Fichier de référence indiquant que l'assignation n'est pas conforme à la présente Résolution;

1.2. Si une administration notificatrice, qui souhaite prolonger la durée de fonctionnement indiquée initialement sur la fiche de notification d'une assignation de fréquence à une station spatiale (1) existante, en informe le Comité plus de trois ans avant la fin de la durée en question et si toutes les autres caractéristiques fondamentales de cette assignation restent inchangées, le Comité modifie conformément à la demande la durée de fonctionnement initialement inscrite au Fichier de référence et publie cette information dans une section spéciale de la circulaire hebdomadaire;

1.3. Si trois ans au moins avant la fin de las durée de fonctionnement inscrite au Fichier de réference d'une assignation de fréquence à une station spatiale (1) existante, une administration entreprend la procédure de coordination prévue au numéro **1060** pour la mise en service d'une nouvelle station spatiale utilisant la même fréquence assignée et la même position orbitale mais avec des caractéristiques techniques différentes et si la Comité conclut après la notification que la nouvelle assignation est conforme aux dispositions du numéro **1503** et qu'elle n'accroit pas par rapport à l'assignation antérieure la probabilité de brouillage au détriment d'une assignation de fréquence figurant dans le Fichier de référence ou dans la procédure de coordination, la nouvelle assignation reçoit une conclusion favorable et est inscrite au Fichier de réference

1.4. Une administration notificatrice qui souhaite apporter une modification aux caractéristiques fondamentales d'une assignation de fréquence à une station spatiale (1) inscrite au Fichier de référence, doit, dans tous les cas autres que ceux prévus aux paragraphes 1.2. et 1.3., entreprendre la procédure correspondant à cette modification selon les dispositions des numéros **1547** a **1551**;

2. Que, pour l'application de dispositions du paragraphe 1.1 ci-dessus, les renseignements relatifs à la durée de validité des assignations de fréquence aux stations spatiales doivent être notifiés en plus des renseignements figurant dans les appendices **3** et **4** du Règlement des radiocommunications;

3. Que l'application de la présente Résolution ne préjugera en aucune manière des décisions de la conférence administrative des radiocommunications spatiales mentionnée dans la Résolution **3**;

invite

la conférence administrative mondiale des radiocommunications spatiales prévue par la Résolution **3** à prendre connaissance des premiers résultats découlant de la mise en application de la présente Résolution.

---

(1) L'expression «station spatiale» peut s'appliquer à plusieurs satellites, à condition qu'un seul satellite soit en fontionnement à un moment quelconque et que les stations installés à bord des satellites successifs aient des caractéristiques fondamentales identiques.

CG RÉSOLUTION Nº 5

Relative à la cooperation technique avec les pays en développement dans le domaine des études de propagation en régions tropicales

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

ayant noté

que l'assistance fournie par l'Union, de concert avec d'autres institutions spécialisée des Nation Unies telles que le PNUD, dans le domaine des télécomunications aux pays en développement, permet de bien augurer de l'avenir;

consciente

a) Du fait que les pays en développement, en particulier ceux situés en régions tropicales, ont besoin d'avoir une meilleure connaissance de la propagation des ondes radioélectriques sur leurs territoires, pour l'utilisation rationnelle et économique du spectre radioélectrique;
b) Du rôle important de la propagation dans les radiocommunications;
c) De l'importance des travaux des CCI dans l'évolution des télécommunications en général et des radiocommunications en particulier;

considérant

a) La nécessité pour les pays en développement de faire eux-mêmes des études de télécommunication en général et de propagation en particulier sur les territoires, ceci étant, pour eux, le meilleur moyen d'acquérir les techniques des télécommunications et de planifier leurs systèmes de façon rationnelle en tenant compte des conditions spéciales en régions tropicales;
b) Les faibles moyens dont disposent ces pays;

décide d'inviter le Secrétaire général

1. À offrir l'assistance de l'Union aux pays en développement situés en régions tropicales qui s'efforcent de faire des études sur leur propre territoire afin d'améliorer et de développer leurs radiocommunications;

2. D'aider ces pays à organiser, si nécessaire avec la collaboration des organisations internationalles et régionales telles que l'Union africaine des postes et télécommunications (UAPT), l'Union panafricaine des télécommunications (UAPT) et l'Union des radiodiffusions et télévisions nationales d'Afrique (URTNA) qui pourraient s'intéresser à la question, des campagnes nationales de mesures de propagation, y compris des collectes de données météorologiques appropriées, effectuées sur la base des Avis, Questions et Programmes d'études du CCIR en vue d'améliorer l'utilisation du spectre radioélectrique;

3. À rechercher des fonds et des ressources à cette fin auprès du PNUD ou d'autres sources de financement de manière à permettre à l'Union d'apporter aux pays concernés une assistance technique à la fois suffisante et efficace aux fins de la présente Résolution;

invite instamment les administrations

à présenter au CCIR les résultats de ces mesures de propagation afin qu'ils soient examinés dans le cadre des études de ce Comité;

invite le Conseil d'administration

à suivre les progrès des campagnes de mesure de propagation et les résultats obtenus et à prendre toute action qu'il jugerait nécessaire.

BW RÉSOLUTION Nº 6

Relative à la préparation d'un manuel destiné à expliquer et à illustrer les procédures du Règlement des radiocommunications

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) La complexité des procédures réglementaires spécifiées au chapitre IV du Règlement des radiocommunications;
b) La nécessité, pour beaucoup d'administrations, de disposer d'un manuel permettant à leur personnel de mieux comprendre ces procédure pour faciliter leur mise en œuvre;
c) Le recours possible à des diagrammes, des organigrammes et d'autres illustrations graphiques facilitant la compréhension de procédures complexes;

reconnaissant

1. Que, faute de temps, il est difficile à la Conférence administrative mondiale des radiocommunications (Génève, 1979), de mettre au point des éléments explicatifs et des diagrammes à inclure ou à joindre aux Actes finals;

2. Qu'un effort est nécessaire pour élaborer un manuel répondant de façon adéquat aux besoins mentionnés sous *b*);

3. Qu'il y aurait intérêt à ce que le format d'un tel manuel soit compatible avec celui du Règlement des radiocommunications;

décide

que l'IFRB doit, aussitôt que possible après la Conférence administrative mondiale des radiocommunications (Génève, 1979), élaborer un manuel comprenant des illustrations graphiques appropriées, y compris des organigrammes, destinnées à aider les personnel des administrations dans l'application des procédures réglementaires prévues au chapitre IV du Règlement des radiocommunications;

charge le Secrétaire général

1. De publier le manuel élaboré par l'IFRB;

2. D'insérer de maniére appropriée dans les éditions publiées du Règlement des radiocommunications les organigrammes, quand ils seront disponibles, assortis d'une remarque précisant qu'ils sont destinés à faciliter la compréhension des procédures mais qu'ils ne font pas partie du Règlement des radiocommunications.

AD RÉSOLUTION Nº 7

Relative à la mise ne œuvre d'une gestion nationale des fréquences radioélectriques

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le Règlement des radiocommunications contient, entre autres dispositions, des procédures de coordination, de notification et d'enregistrement des fréquences déterminant les droits et obligations des pays Membres;

b) Que l'application de ces procédures nécessite un service de gestion de fréquences radioélectriques dans chaque pays Membre;

c) Que l'existence d'un tel service aide les pays Membres à sauvegarder leurs droits et à s'acquitter de leurs obligations conformément au Règlement des radiocommunications;

d) Que l'application du Règlement par l'internédiaire d'un tel service est dans l'intérêt de l'ensemble de la communauté internationale;

notant

qu'un tel service de gestion de fréquences radioélectriques nécessité un personnel dûment qualifié et en nombre suffissant;

notant en outre

que les administrations de nombreaux pays en développement ont besoin de créer ou de renforcer un tel service approprié à leur structure administrative, et de le charger de l'application du Règlement des radiocommunications sur le plan national et international;

recommande

aux administrations de ces pays de prendre les mesures à cet effet;

décide

1. Que des réunions seront organisées entre des représentants de l'IFRB et du CCIR et des participants concernés par les questions relatives à la gestion des fréquences dans les administrations des pays en développement et des pays développés;

2. Que l'objet de ces réunions est de mettre au point des modèles de structures appropriées aux administrations de pays en développement et de discuter les moyens de les mettre en œuvre et d'exploiter ces services de gestion des fréquences;

3. Que ces réunions devraient aussi identifier les besoins particuliers de pays en développement pour établir de tels services et les moyens requis pour satisfaire ces besoins;

recommande

aux pays en développement de prévoir, lors de la planification de l'utilisation des fonds reçus notamment des instances internationales, la participation aux réunions ainsi que la création et le développement de ces services;

invite le Conseil d'administration

à prendre les mesures nécessaires pour l'organisation de telles réunions;

charge le Secrétaire général

1. De diffuser la présente Résolution auprès de tous les Membres de l'Union en attirant leur attention sur son importance;

2. De diffuser les résultats de ces réunions, notamment auprès des pays en développement;

3. D'indiquer à ces pays les formes d'aide que l'UIT est en mesure de mettre à leur disposition pour l'implantation de la structure qu'ils désirent;

attire l'attention de la prochaine Conférence de plénipotentiaires sur

1. Les problèmes particuliers identifiés dans la présente Résolution;
2. Le besoin d'entreprendre, dans les meilleurs délais, une action efficace en vue de leur solution;
3. Le besoin de prendre toutes mesures pratiques pour dégager les ressources à cet effet.

CV RÉSOLUTION Nº 8

Relative à la mise en œuvre des modificactions d'attributions dans les bandes comprises entre 4000 kHz et 27 500 kHz

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'un certain nombre de bandes de fréquences comprises entre 4000 kHz et 27 500 kHz et qui étaient attribuées auparavant en exclusivité ou en partage au service fixe ont été réattribuées à d'autres services;

b) Que les assignations existantes aux stations des services fixe et mobile doivent être progressivement éliminées de ces bandes réattribuées pour faire place à d'autres services;

c) Que les assignations devant être déplacées, appelées «assignations à transférer», doivent être reclassées dans d'autres bandes de fréquences;

consciente

des difficultés que rencontreront les administrations et l'IRFB pendant le passage des anciennes attributions à celles de la présente Conférence;

décide

1. Que la procédure de transition de l'annexe A à la présente Rèsolution est utilisée en vue d'assurer le passage ordonné et équitable des anciennes attributions à celles qui sont faites par la présente Conférence;

2. Que les dispositions du numéro **1242** et les dispositions associées de l'article 12 relatives à l'examen et à l'inscription dans le Fichier de référence des assignations dans les bandes comprises entre 4000 kHz et 27 500 kHz attribuées en exclusivité ou en partage au service fixe sont suspendues du 1er janvier 1982 au 30 juin 1984;

3. Que la procédure intérimaire de l'annexe B à la présente Résolution est utilisée afin de tenir compte de toute assignation de fréquence nouvelle et urgente, dans les bandes concernées, au cours de la période de suspension des dispositions de l'article 12 visée au point 2 du dispositif;

4. Que la procédure de révision de l'annexe C à la présente Résolution est utilisée afin de examiner, à l'issue la période de transition, toute nouvelle assignation de caractère urgent notifiée pendant la période de suspension des dispositions de l'article 12 visée au point 2 du dispositif;

5. Qu'une procédure particulière de transfert, décrite dans la Resolution **404,** s'applique aux stations du service fixe aéronautique fonctionnant dans la bande 21 954-22 000 kHz [bande que la présente Conférence a attribuée en exclusivité au service mobile aéronautique (R)] et sera terminé le 1er fevrier 1983;

invite les administrations

1. Dans la recherche du réaménagement de leurs assignations du service mobile qui se trouvent dans les bandes comprises entre 4000 kHz et 27 500 kHz réattribuées à d'autres services à ne ménager aucun effort pour trouver des assignations de remplacement dans les bandes attribuées en exclusivité au service mobile concerne;

2. À faciliter la coopération en s'abstenant de soumettre des fiches de notification portant sur des assignantions dans les bandes concernées, pendant la période de suspension des dispositions de l'articlel 12 visée au point 2 du dispositif, sauf dans le cas d'assignation urgentes et nouvellles á traiter dans le cadre de la procédure intérimaire;

prie l'IFRB

pendant la période de suspension des dispositions de l'article 12 visée au point 2 du dispositif de n'examiner, aux termes de cet article, aucune fiche de notification dans les bandes concernées aute que celles nécessitant le supression d'assignations existantes.

ANNEXE A À LA RÉSOLUTION Nº 8

Procédure de transition relative au choix et á l'approbation des assignations de remplacement

PARTIE I

Phase préparatoire

SECTION I

Préparation et publication par l'IFRB d'un ensemble de propositions concernant les assignations de remplacement

1. Pour les besoins de cette Résolution, l'expression «assignation à transférer» se réfèrer à une assignation de fréquence à une station du service fixe dans les parties des bandes de fréquences antérieurement attribuées au service fixe et nouvellement atribuées à d'autres services, et pout laquelle une assignation de remplacement doit être trouvée confornément à la présente Résolution.

2. Le Comité, dès que possible après la fin de l'application de la procédure décrite en annexe à la Résolution **9**, établit un ensemble de propositions en vue du remplacement de toutes les assignations à tranférer inscrites dans la section provisoire du Fichier de référence dans les bandes comprises entre 4000 kHz et 27 500 kHz que la Conférence administrative mondiale des radiocommunications (Génève, 1979) a tranférées du service fixe à d'autres services.

3. Les assignations à transférer sont traitées dans l'ordre des dates revisées inscrites dans la colonne 2d, comme indiqué dans la Résolution **9**. En outre, toutes les assignations á transférer qui portent la même date révisée sont traitées dans l'ordre suivant:

1) Assignations pour utilisation nationale;
2) Assignations pour utilisations internationale.

Lors de l'application de cette disposition, les assignations à transférer sont traitées par lots sans accorder de priorité aux assignations d'une administration quelconque.

4. Les assignations à transférer de classe de fonctionnement C ne sont traitées que lorsqu'il a été trouvé des solutions pour toutes les assignations transférées des classes de fonctionnement A ou B.

5. Les assignations à transférer de classe de fonctionnement C sont réparties autant que possible uniformément dans les bandes qui sont encore attribuées au service fixe.

6. Le Comité, lorsqu'il applique les dispositions de la présente section, et afin de protéger les assignations inscrites, n'utilise que le Fichier de référence réaménagé conformément à la procédure décrite en annexe à la Résolution **9**.

7. Le 1er juillet 1983 le Comité envoie à chaque administration un document énumérant toutes les assignations concernant cette administration, en indiquant celles qui sont inscrites dans la section provisoire du Fichier de référence et celles qui sont proposées en remplacement.

SECTION II

Examen et approbation des assignations proposées

8. Au reçu du document mentionné au paragraphe 7, chaque administration en accuse réception et examine les assignations de remplacement proposées pour s'assurer qu'elles sont acceptables; elle informe, dès que possible, le Comité:

De son accord; ou
Des assignations qu'elle estime inacceptables.

Dans ce dernier cas, l'administration donne ses raisons au Comité le plus rapidement possible.

9. Le Comité examine les réponses reçues au titre du paragraphe 8 et s'efforce de donner satisfaction aux administrations intéressées, en ce qui concerne les assignations proposées jugées inacceptables, en procédant de préférence à de légères modifications. Pour cela, il procéde de la manière suivante:

Il rassemble toutes les réponses reçues au titre du paragraphe 8 dans un délai de six mois à partir du 1er juillet 1983, puis il les traite ensemble et sans accorder de priorité à la réponse d'une administration quelconque; puis

Il rassemble toutes les réponses reçues au titre du paragraphe 8 entre six et neuf mois à partir du 1er juillet 1983, puis il traite la seconde série comme indiqué ci-dessus pour la première série.

SECTION III

Mesure à prendre par le Comité

11. Lorsque la procédure prescrite dans les sections I et II de la présente annexe a pris fin, le Comité inscrit dans le Fichier de référence toutes les assignations de remplacement acceptées par les administrations, avec une annotation indiquant:

Qu'elles auront le même statut que les assignations qui n'ont pas été transférées, conformément aux dispositions de la Résolution **9**;

Leur caractère provisoire conformément aux dispositions du numéro **1311**.

12. Pour toutes les assignations mentionnées au paragraphe 11, le Comité inscrit la date appropriée dans la colonne 2d du Fichier de référence, conformément au paragraphe 6.3 de l'annexe à la Résolution **9**.

13. Le Comité publie ensuite, sous la forme de suppléments récapitulatifs à la Liste internationale des fréquences, toutes les assignations de remplacement faites conformément à la procédure prescrite dans la partie I de la présente annexe.

14. Après publication des suppléments prescrits au paragraphe 13, le Comité informe par télégramme toutes les administrations dont les assignations à transférer de classe de fonctionnement A encore en suspens n'ont pu être transférées.

SECTION IV

Entrée en vigueur de l'article 12

15. A partir du 1er juillet 1984, les dispositons de l'article 12 s'appliqueront aux bandes de fréquences attribuées au service fixe entre 4000 kHz et 27 500 kHz.

16. Après cette date, une administration qui a été informée par le Comité en application du paragraphe 14 que certaines de ses assignations à transférer n'ont pas été remplacées au titre de la procédure de transition, pourra choisir de nouvelles assignations, compte tenu des assignations inscrites dans le Fichier de référence en application du paragraphe 11, et présentera au Comité de nouvelles notifications conformément à l'article 12.

PARTIE II

Phase de transfert

SECTION V

Mesure à prendre par les administrations

17. Après avoir reçu et accepté les assignations de remplacement de ses assignations inscrites et transférées par décision de la Conférence administrative mondiale des radiocommunications (Génève, 1979), une administration effectue le passage de l'ancienne à la nouvelle assignation au plus tard:

Le 1er juillet 1989 pour les bandes de fréquences supérieures à 10 MHz;
Le 1er juillet 1994 pour les bandes de fréquences inférieures à 10 MHz.

18. Après avoir effectué le passage de l'ancienne assignation à l'assignation, de remplacement, une administration en informe promptement le Comité; ce dernier biffe le symbole spécial placé en regard de l'assignation de remplacement conformément au numéro **1311** (voir le paragraphe 11 ci-dessus), dans le Fichier de référence, ce qui indique que le transfert a été effectué, et inscrit la date du changement dans la colonne 2c. La date qui figurait initialement dans la colonne 2c en regard de l'assignation transférée est inscrite dans la colonne Observations.

19.1. Si, après avoir effectué le passage à une assignation de remplacement de classe de fonctionnement A, une administration subit un brouillage préjudiciable ou reçoit une plainte en brouillage préjudiciable concernant une autre assignation de classe de fonctionnement A, cette administration:

a) S'efforce de régler le problème avec toute autre administration concernée;
b) Et, en cas d'échec, peut choisir et soumettre au Comité une assignation de remplacement (1).

19.2. Si, après avoir effectué le passage à une assignation de remplacement de classe de fonctionnement B, une administration subit un brouillage préjudiciable à cette de fonctionnement, cette administration peut choisir et présenter au Comité une autre assignation de remplacement (1).

20. Après avis favorable du Comité concernant l'assignation de remplacement choisie en application du numéro 19.1, *b*), ou 19.2, cette administration est autorisée à demander l'inscription dans la colonne 2d du Fichier de référence, en regard de cette assignation, de la date commune du 1er janvier 1982 pour la classe de fonctionnement A et du 2 janvier 1982 pour la classe de fonctionnement B.

SECTION VI

Signification des dates inscrites dans le Fichier de référence

21. La signification des dates concernant les assignations transférées est mentionné dans l'annexe à la Résolution **9** et dans l'article 12.

---

(1) Le Comité aidera l'administration qui en fait la demande à mettre en œuvre la procédure décrite au paragraphe, 19.1, *b*), ou 19.2.

ANNEXE B À LA RÉSOLUTION Nº 8

Procédure intérimaire concernant les fiches de notification d'assignation de fréquence dans les bandes attribuées en exclusivité ou en partage au service fixe, entre 4000 kHz et 27 500 kHz

1. Durant la période comprise entre 1er janvier 1982 et le 30 juin 1984, une administration, qui a besoin d'une assignation d'une urgence telle qu'elle ne peut attendre la fin de la période de transition, peut notifier une nouvelle assignation dans les bandes attribuées en exclusivité ou en partage au service fixe entre 4000 kHz et 27 500 kHz. Les fiches de notification ainsi présentées doivent contenir les renseignements énumérés dans la section pertinente de l'appendice 1.

2. Une administration qui soumet une fiche de notification conformément au paragraphe 1 ci-dessus est réputée accepter que son assignation:

a) Soit de nature intérimaire;
b) Soit soumise à la procédure de révision décrite dans l'annexe C à la présente Résolution et doive, le cas échéant, être modifiée, compte tenu des résultats de cette révision;
c) Ne cause de brouillage préjudiciable à aucune assignation inscrite dans le Fichier de référence et ayant droit à une protection.

3. Au reçu d'une fiche de notification complète et conforme au paragraphe 1, le Comité l'examine relativement au numèro **1240** et retourne à l'administration notificatrice toute fiche de notification qui ne serait pas conforme à cette disposition, en donnant les motifs de ce renvoi.

4. Les fiches de ntofication conformes au numéro **1240** sont inscrites dans une section spéciale de la circulaire hebdomadaire avec une annotation indiquant qu'elles sont à la fois sujettes à la procédure intérimaire et à la procédure de révision décrites respectivement dans la présente annexe et dans l'annexe C à la présente Résolution. Les assignations notifiées en application du numéro **1218** sont, de plus, annotées en conséquence.

5. Le Comité établit et tient à jour une Liste spéciale de toutes les fiches de notification traitées au titre du paragraphe 4.

ANNEXE C À LA RÉSOLUTION Nº 8

Procédure de révision concernant des assignations de fréquence à des stations du service fixe dans les bandes comprises entre 4000 kHz et 27 500 kHz

1. Dès le 1er juillet 1984, le Comité examinera conformément aux dispositions appropriées de l'article 12 toutes les assignations intérimaires de la Liste spéciale établie conformément à l'annexe B à la présente Résolution en vue de leur inscription dans le Fichier de référence.

2. Pour les besoins de cet examen, les assignations intérimaires seront traitées sans qu'aucune priorité ne soit accordée à une administration quelconque, les assignations notifiées aux termes du numèro **1218** étant cependant traitées en premier lieu.

3. Toutes les assignations intérimaires doivent être exaiminées par le Comité eu égard à la probabilité de brouillage préjudiciable ayant pour origine les assignations inscrites dans le Fichier de référence à titre provisoire en application des dispositions de l'annexe A de la présente Résolution, et au égard à la probabilité de brouillage préjudiciable causé à ces dernières assignations. Selon les conclusions formulées par le Comité à la suite de cet examen, les mesures suivantes sont prises.

4. *Conclusion favorable relativement au paragraphe 3 ci-dessus.*

4.1. Les assignations intérimaires notifiées aux termes du numéro **1218** sont inscrites dans le Fichier de référence, la date 1er juillet 1984 étant inscrites dans la colonne 2d.

4.2 Les autres assignations intérimaires doivent être examinées conformément au numéro **1242** par rapport aux assignations de fréquence inscrites dans le Fichier de référence à la date du début de la procédure intérimaire décrite dans l'annexe B à la présente Résolution. Selon les conclusions du Comité, les dispositions pertinentes de l'article 12 sont appliquées. Si de telles assignations doivent être inscrites, la date 1er juillet 1984 doit être portée dans la colonne 2d.

5. *Conclusion défavorable relativement au paragraphe 3 ci-dessus.*

Compte tenu de la classe de fonctionnement de l'assignation et du contenu du Fichier de référence mis au net, le Comité propose des assignations de remplacement appropriées et les inscrit provisoirement en portant la date 1er juillet 1984 dans la colonne 2d.

6. Lorsque cet examen est terminé, le Comité établit et publie sous forme d'annexe á sa circulaire hebdomadaire une Liste temporaire des assignations inscrites et des assignations de remplacement proposées. Il envoie un exemplaire de cette Liste, ainsi qu'un extrait par pays, à chacune des administrations qui a des assignations intérimaires dans la Liste spéciale mentionnée au paragraphe 1 de la présente annexe.

7. Au reçu de la Liste mentionnée au paragraphe 6, les administrations étudient les assignations proposées en remplacement de leurs assignations intérimaires et, dans un délai de cinq mois à compter de la date de publication de la Liste temporaire, font savoir au Comité si les assignations proposées sont acceptables. Si les assignations proposées ne sont pas acceptables, les administrations doivent en indiquer les motifs.

8. En acceptant les assignations proposées, les administrations doivent en indiquer la date ultime de mise en service. Cette date ne doit pas dépasser un délai d'un an à compter de la publication de la Liste temporaire.

9. En examinant les réponses faites en applications du paragraphe 7, le Comité s'efforce, si nécessaire par de légers ajustements de donner satisfaction aux administrations intéressées en ce qui concerne les assignations proposées et jugées inacceptables et leur propose des fréquences de remplacement. Simultanément, le Comité remplace l'inscription provisoire pertinente par la nouvelle fréquence proposée.

10. Si, à la date du 1er juillet 1985, les inscriptions provisoires faites en vertu des paragraphes 5 ou 9 n'ont pas été acceptées par les administrations intéressées, le Comité les remplace par les assignations intérimaires correspondantes avec une annotation appropriée. A compter de cette date, ni la Liste spéciale ni la Liste temporaire ne sont plus prises en considération.

11. Les administration, qui ont des assignations intérimaires pour lesquelles il n'a pas été possible de trouver d'assignations de remplacement acceptables, sont libres de choisir de nouvelle assignations de remplacement et envoient de nouvelles fiches de notification conformément aux dispositions de l'article 12. Le Comité aide l'administration qui en fait la demande à mettre en oeuvre la procédure décrite dans le présent paragraphe.

CT

RÉSOLUTION Nº 9

Relative à la révision de certaines parties du Fichier de référence international des fréquences dans les bandes de fréquences attribuées au service fixe comprises entre 3000 kHz et 27 500 kHz

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considèrant

a) Qu'il est nécessaire d'eméliorer la précision et la fiabilité du Fichier de référnce international des fréquences, notamment dans les bandes attribuées en exclusivité ou en partage au service fixe comprises entre 3000 kHz et 27 500 kHz;

b) Que des initiatives antérieures de l'IFRB ont prouvé qu'il est possible, grace à la coopération des administrations, d'améliorer sensiblement la précision et la fiabilité du Fichier de référence;

reconnaissant

a) Que, pour résoudre le problème, il faut l'élaborer à l'échelle mondiale dans un esprit de coopération active;

b) Qu'il est nécessaire de définir, pour réviser certaines parties du Fichier de référence, une procédure prévoyant la coopération de toutes les administrations et de l'IFRB;

reconnaissant en outre

a) Qu'une part importante des assignations concernant le service fixe est destinée à des utilisations autres que l'exploitation régulière;

b) Que l'identification de la classe de fonctionnement de ces assignations dans de Fichier de référence faciliterait la gestion internationale des bandes de fréquences attribuées au service fixe dans cette partie du spectre et devrait constituer une caractéristique type du Fichier de référence;

c) Que la détermination des horaires réguliers de fonctionnement faciliterait également la gestion de ce service;

d) Que cette manière d'identifier la classe de fonctionnement et l'horaire régulier de fonctionnement de ces assignations devrait être appliquée à toute procédure destinée á la révision;

e) Qu'une fois appliquées, ces mesures constitueraient une base solide pour l'adoption des arrangements de transition nécessaires au remplacement des assignations aux stations du service fixe à transférer par suite de décisions de la Conférence administrative mondiale des radiocommunications (Génève, 1979);

décide

d'adopter la procédure décrite en annexe à la présente Résolution aux fins de la révision des parties du Fichier de référence relatives aux bandes attribuées au service fixe entre 3000 kHz et 27 500 kHz;

décide, d'autre part,

que la présente Résolution entrera en vigueur le 1er janvier 1980;

invites les administrations et l'IFRB

à collaborer sans réserve et dans les plus brefs délais à l'applications de cette procédure.

ANNEXE À LA RÉSOLUTION Nº 9

Procédure applicable à la révision des inscriptiones dans le Fichier de référence dans les bandes attribuées au service fixe entre 3000 kHz et 27 500 kHz

1. Le Comité extrait du Fichier de référence et communique, à chaque administration, dès que possible aprés le 1ª janvier 1980, une Liste nationale (1) individuelle de toutes des assignations (2) qui sont inscrites dans le Fichier de référence au nom de cette administration ou pour lesquelles des fiches de notification ont été reçues avant cette date, dans les bandes attribuées en exclusivité ou en partage au servive fixe entre 3000 kHz et 27 500 kHz. En même temps, le Comité attire l'attention de cette administrration sur les assignations pour lesquelles un autre moyen de télecomunication apparaît disponible.

2. Au reçu de la Liste mentionnée au paragraphe 1 ci-dessus, chaque administration en accuse réception au Comité par télegramme. Une administration qui n'a pas reçu sa Liste nationale au 1ª avril 1980 en informe promptement le Comité, qui envoie sans délai à cette administration un autre exemplaire. Le Comité doit s'assurer que chacune des administrations a bien reçu la Liste nationale relative à ses propres assignations.

3. Après avoir accusé réception de sa Liste nationale, chaque administration examine celle-ci et:

a) Supprime toute inscription qui ne serait plus nécessaire;

b) Classe les inscriptions restantes du service fixe à l'aide des symboles suivants:

Symbole A — assigantion destinée à être utilisée pour exploitation régulière qui n'est pas assurée par un autre moyen satisfaisant de télécommunication;

Symbole B — assignation destinée à être utilisée comme assigntion de réserve pour un autre moyen de télecommunication;

Symbole C — assignation pour une utilisation occasionnele en réserve n'exigeant pas de protection internationalement reconnue contre les brouillages préjudiciables;

c) Indique les heures normales (UTC) de fonctionnement de l'assignation ou les indique en serviec de jour (HJ), service de nuit (HN) ou service de transition (HT).

4. Après avoir apliqué les dispositions visées aux paragraphes 2 et 3 ci-dessus, chaque administration renvoie sa Liste nationale annotée au Comité, dès que possible et au plus trad le 31 mars 1981.

5. Le Comité envoie à chaque administration un accusé de réception de sa Liste nationale annotée; en cas de difficulté spéciale ou à la demande des administrations, le Comité leur fournit l'assitance et les conseils que justifient, le cas échéant, les circonstances.

6. Le 1ª octobre 1981, le Comité publiera un section provisoire du Fichier de référence se rapportant uniquement aux assignations dans les bandes attribuées au service fixe entre 3000 kHz et 27 500 kHz. Cette section comportera toutes les assignations figurant dans les Listes nationales telles qu'annotées par les administrations, et les assignations figurant dans les Listes nationales qui n'auront pas été renvoyées au Comité, à l'exception des assignations ayant fait l'objet d'une conclusion défavorable relativement au numéro **1240**, sans référence au numéro **342**. Les assignations inscrites dans cette section provisoire seront annotées de la maniére indiquée ci-après:

6.1. Toutes les assignations porteront un symbole indiquant une référence à la présente Résolution.

6.2. Les dates inscrites dans les colonnes 2a, 2b ou 2d ou le symbole inscrit dans la colonnne 2d et les conclusions figurant dans la partie appropriée de la colonne 13 seront modifiées comme indiqué dans le tableau annexé.

6.3. Les assignations de fréquence aux stations du service fixe dans les parties de bandes réattribuées à d'autres services porteront un symbole indiquant qu'il s'agit d'assignations pour lesquelles on trouvera des assignations de remplacement conformément à la Résolution **8**, en maintenant la date et le statut indiqués dans le tableau annexé.

7. Avant d'appliquer les paragraphes I.2 et II.2 du tabeau annexé aux assignations des pays ayant un petit nombre d'assignations, le Comité consul l'administration dont l'assignation a motivé une conclusion défavorable pour s'assurer qu'aucun brouillage efectif ne s'est produit depuis l'inscription de l'assignation. Si l'administration répond qu'aucun brouillage ne s'est produit, le Comité inscrira le symbole correspondant à la classe de fonctionnement A de l'assigantion et modifiera la conclusation défavorable. Dans tout autre cas il appliquera les dispositions du numéro **1218** pour trouver une autre fréquence et remplacera la fréquence en consultant l'administration intéressée.

8. Dès que possible, après le 1ª janvier 1982, le Comité devra:

8.1. Publier un supplément à la section provisoire du Fichier de référence contenant les assignations pour lesquelles des fiches de notification auront été reçues entre le 1ª janvier 1980 et le 31 décember 1981 et inscrites dans le Fichier de référence

8.2. Envoyer aux administrations un exemplaire de leur Liste nationale.

8.3. Incorporer dans le Fichier de référence la section provoire mentionnée au paragraphe 6, y compris les assigantions mentionnées au paragraphe 8.1 ci-dessus en remplacement des inscriptions correspondantes dans les bandes de fréquences en question.

9. Après avoir accompli ces tâches, le Comité publiera un rapport indiquant les résultats obtenus grâce à cette procédure.

---

(1) Le Comité détermine par une enquête préalable le nombre d'exemplaires de la Liste nationale à adreser à chaque administration. La Liste nationale est présentée de la même manière que la Liste internationale des fréquences mais le mode d'envoi de la Liste peut varier selon les circonstances, en fonction des demandes des administrations et sous réserve de l'accord du Comité.

(2) Pour les besoins de la présent procédure les assignations à des stations du service fixe aéronautique sont considérées comme des stations du service fixe dans la ou les bandes concernées.

TABLEAU

	Colonne 13a	Colonne 13b	Colonne 13c
1. Bandes de fréquences inférieures à 3900 kHz (Région 1), 3950 kHz (Région 3) et 4000 kHz (Région 2)			
1.1. Listes renvoyées au Comité:			
Classe de fonctionnement A des assignations	Supprimer tous les symboles indiquant les conclusions relativement au numéro **1241**.	Remplacer la date en 2a ou 2b par 1-1-82 en 2a.	RES 9 SUP RR 515
Classes de fonctionnement B ou C des assignations	Idem	Remplacer la date en 2a ou 2b par 1-1-82 en 2a.	RES 9 SUP RR 515
Inscriptions selon le numéro **342** du Règlement des radiocommunications.	NOC	Remplacer la date par 5-1-82 en 2b.	RES 9
1.2. Listes non renvoyées au Comité:			
Assignations inscrites avec une date en 2a	NOC	Remplacer la date par 3-1-82 en 2a.	RES 9
Assignations inscrites ave une date en 2b	NOC	Remplacer la date par 4-1-82 en 2b.	RES 9
Inscriptions selon le numéro **342** du Règlement des radiocommunications.	NOC	Remplacer la date par 5-1-82 en 2b.	RES 9
2. Bandes de fréquences supérieures à 3900 kHz (Région 1), 3950 kHz (Région 3) et 4000 kHz (Région 2)			
1.1. Listes renvoyées au Comité:			
Classe de fonctionnement A des assignations	Supprimer tous les symboles indiquant les conclusions relativement au numéro **1242**.	Remplacer la date ou le symbole en 2d par 1-1-82.	RES 9 SUP RR 515
Classes de fonctionnement B ou C des assignations	Idem	Remplacer la date ou le symbole en 2d par 2-1-82.	RES 9 SUP RR 515
Inscriptions selon le numéro **342** du Règlement des radiocommunications.	NOC	Remplacer la date ou le symbole en 2d par 5-1-82.	RES 9
1.2. Listes non renvoyées au Comité:			
Conclusion favorable relativement au numéro **1240** ...	NOC	Remplacer la date ou le symbole en 2d par 3-1-82.	RES 9
Inscriptions selon le numéro **342** du Règlement des radiocommunications.	NOC	Remplacer la date ou le symbole en 2d par 5-1-82.	RES 9

AF

RÉSOLUTION Nº 10

Relative à utilisation de liaisons radiotélegraphies et radiotéléphoniques par les organisations de la Croix-Rouege, du Croissant-Rouge et du Lion-et-Soleil-Rouge

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que l'œuvre universelle de secours des organisations de la Croix-Rouge, du Croissant-Rouge et du Lion-et--Soleil-Rouge prend une importance croissante et qu'elle est souvent indispensable;

b) Que, dans ces circonstances, il arrive fréquemment que les moyens normaux de communications soient surchargés, endommagés, complètement interrompus ou indisponibles;

c) Qu'il est nécessaire de faciliter par tous les moyens possibles l'intervention efficace de ces organisations, nationales et internationales;

d) Que des moyens de liaisson rapides et autonomes sont essentiels dans les interventions de ces organisations;

e) Qu'il est nécessaire que les organisations nationales de la Croix-Rouge, du Croissant-Rouge et du Lion-et--Soleil-Rouge engagées dans une action de secours international puissent communiquer entre elles et avec le Comité international de la Croix-Rouge et la Ligue des Sociétés de la Croix-Rouge;

décide de prier instamment les administrations

1. De prendre en considération les besoins éventuels des organisations de la Croix-Rouge, du Croissant-Rouge et du Lion-et-Soleil-Rouge en moyens de radiocommunication si les moyens normaux de communication sont interrompus ou indisponibles;

2. D'assigner à ces organisations le nombre minimum de fréquences de travail nécessaires en conformité avec le Tableau d'attribution des bandes de fréquences; pour les circuits entre 3 Mhz et 30 MHz, on choisira dans la mseure du possible des fréquences adjacentes aux bandes du service d'amateur;

3. De prendre toutes les mesures partiquement possibles pour protéger ces liaisons contre les brouillages préjudiciables.

CY

RÉSOLUTION Nº 11

Relative à utilisation des radiocoommunications pour la sécurité des anvires et des aéronefs des États non parties à un confllit armé (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le droit international reconnaît aux États non parties à un conflit armé, applés ci-après États neutres, le droit d'exercer en sécurité des activités commerciales normales sans risque de dommages de la parte d'États parties à um conflit armé;
b) Qu'au voisinage du lieu d'un conflit armé, les navires et aéronefs d'un État neutre courent un risque considérable;
c) Que, pour la sauvegarde de la vie humaine, il est souhaitable, dans ces circonstances, de pouvoir identifier ces navires et aéronefs et d'un déterminer la position;
d) Que les radiocommunications offrent un moyen rapide d'identifier et de localiser les navires et aéronefs avant qu'ils entrent dans une zone de conflit armé et pendant qu'ils traversent cette zone;

tenant compte

a) Que la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974) a adopté une recommandation relative aux transports sanitaires et à la sécurité des navires et aéronefs des États non parties à un conflit armé; et
b) Que la Conférence administrative mondiale des radiocommunications (Génève, 1979) a traité à fond la question des transports sanitaires dans le cadre du Règlement des radiocommunications en ajoutant une nouvelle section II à l'article 40, mais qu'elle n'a pas pris de dispositions pour la sécurité des navires et aéronefs des États neutres;

décide d'inviter les administrations

1. À garder présentes à l'esprit les conditions à remplies pour identifier et localiser les navires et aéronefs des États neutres et pour communiquer avec eux, et notamment la possibilité d'utiliser les radars secondaires aéronautiques de surveillance et les répondeurs radar maritimes;

2. À étudier s'il est nécessaire d'établir une procédure accepatle et, dans l'affirmative, à la définir afin de contribuer à assurer la sécurité des navires et aéronefs des États neutres en période de conflit armé, en se référant à l'annexe à la présente Résolution qui décrit une procédure possible;

invite le Conseil d'administration

à prendre en considération l'inscription de cette question à l'ordre du jour de la prochaine conférence administrative mondiale des radiocommunication compétente:

charge le secrétaire général

de communiquer le contenu de la présente Résolution à l'OMCI et à l'OACI afin qu'elles prennent les mesures appropriées.

ANNEXE À LA RÉSOLUTION Nº 11

Procédure possible pour l'identification et la localisation des navires et aéronefs des États neutres

Aux fins d'annonce et d'identification de navires et d'aéronefs des États non parties à un conflit armé, mentionnés ci-après comme transportes neutres une transmission complète des signaux d'urgence décrits aux numéros **3196** et **3197** sera suivie par l'adjonction du seul groupe «NNN» en radiotélégraphie et par l'adjonction du mot unique «NEUTRAL» prononcé comme en français, en radiotéléphonie.

Les fréquences énumérés au numéro **3201** peuvent être utilisées par les transports neutres aux fins d'auto-identification et d'établissement des communications. Dès que possible, la communication doit être transférée sur une fréquence de travail appropriée.

L'utilisation du signal comme décrit dans le premier paragraphe indique que le message qui suit concerne un transport neutre. Le message doit contenir les données suivantes:

a) L'indicatif d'appel ou tout autre moyen reconnu d'identification du véhicule de transport neutre;

---

(1) Remplace la Recommandation Nº Mar2-17 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1977).

b) La position du véhicule de transport neutre;
c) Le nombre et le type de véhicules de transport neutre;
d) L'itinéraire prévu;
e) La durée estimée du déplacement et les heures de départ et d'arrivée prévues, selon le cas;
f) Toute autre information, telle qu'altitude de vol, fréquences radioélectriques de veille, lengues utilisées, modes et codes des systèmes de radars secondaires de surveillance.

Les dispositons de la section I de l'article 40 s'appliquent, s'il y a lieu, à l'utilisation des signaux d'urgence par des transports neutres.

L'identification et la localisation des navires neutres peuvent être effectuées au moyen des répondeurs radar maritimes normalisés.

L'identification et la localisation des aéronefs neutres peuvent être effectuées au moyen du système de radar secondaire de surveillance (SSR), tel qu'il est spécifié à l'annexe 10 de la Convention de Chicago du 7 décembre 1944, relative à l'Aviation civile internationale, mise à jour periodiquement. Le mode et de code SSR à réserver à l'usage exclusif des aéronefs neutres doivent être définis par els Parties aux conflit ou l'une des parties au conflit, agissant d'un commum accord ou isolément, conformément à des procédures recommandées par l'Organization de l'aviation civile internationale.

L'utilisation des radiocommunications pour annoncer et identifier les transports neutres est facultative; cependant, si elles sont employées, les dispositions du Règlement des radiocommunications et, en particulier, celles des articles 37 et 38 s'appliquent.

DC

RÉSOLUTION Nº 12

Relative aux nouvelles règles de formation des indicatifs d'appel

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

notant

a) Que de nombreaux pays, en particulier les pays en développement, ont un besoin urgent de nouveaux indicatifs d'appel;
b) Que le Règlement des radiocommunications (Génève, 1979), contient à l'article 25 de nouvelies règles de formation des indicatifs d'appel;
c) Que, selon l'article 69 du Règlement, ces règles entreront en viguer le 1er janvier 1981;

prie instamment des administrations concernées

d'utuliser les nouvelles règles de formation des indicatifs d'appel contenues dans l'article 25 du Règlement dès que nécessaire et même avant la date fixée pour leur entrée en viguer;

charge le Secrétaire général

de publier les renseignements reçus de ces administrations sur l'utilisation des nouvelles règles de formation des indicatifs d'appel.

DE

RÉSOLUTION Nº 13

Relative à la formation des indicatifs d'appel et à l'attribution de nouvelles séries internationales (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) La recommandation de la Conférence internationale des radiocommunications (Atlantic City, 1947) relative à la formation des indicatifs d'appel;
b) La demande croissante d'indicatifs d'appel due tant à l'augmentation du nombre des Membres de l'Union qu'à celle des besoins des pays déjà Membres;
c) Les renseignements fournis par le Secrétaire général en ce que concerne les attributions de séries d'indicatifs d'appel depius 1947 et les possibles du système de formation des indicatifs d'appel actuellement utilisé;

estimant

qu'il convient, autant que possible, d'éviter de modifier les indicatifs d'appel actuellement en usage;

---

(1) Remplace la Résolution Nº 8 de la Conférence administrative des radiocommunications (Génève, 1959).

notant

a) Que les anciennes séries d'indicatifs d'appel formées, soit de trois lettres, soit d'un chiffre et de deux lettres, étant épuisées, il a été recouru à de nouvelles séries composées d'une lettre, d'un chiffre et d'une lettre, ce chiffre ne pouvant en aucun cas être 0 ou 1;

b) Que la méthode mentionnée à l'alinéa *notant a*) ne s'applique pas aux séries commeçant par les lettres suivantes: B, F, G, I, K, M, N, R, U, W;

c) Qu'il a été soumis à la présente Conférence une proposition visant à former de nouvelles séries d'indicatifs d'appel en remplaçant le roisième caractère, qui est une lettre, par un chiffre;

d) Que cela entraînerait toutefois des modifications sucessives à la section III de l'article **25**;

décide

1. Que le secrétaire général continuera à inviter instamment les administrations:

1.1. À utiliser au maximum les possibilitités des séries qui leur sont actuellement attribuées afin d'éviter, autant que possible, de nouvelles demandes;

1.2. À réexaminer les indicatifs d'appel assignés jusqu'à présent un vue de libérer éventuellement certaines séries et de les remettre à la disposition de l'Union;

2. Que le Secrétaire général fournira tous les conseils utiles aux administrations qui lui en feront la demande sur les moyens d'employer dans les meilleurs conditions d'économie, comme il est de règle, les séries qui leur sont attribuées;

3. Que si malgré tout, il apparît que toutes les possibilités du système actuel de formation des indicatifs d'appel doivent être épuisées avant la prochaine conférence administrative mondiale des radiocommunications compétente le secrétaire général:

3.1. Étudiera la possibilité de former de nouvelles séries d'indicatifs d'appel sur la base des propositions mentionnées au paragraphe *notant c*);

3.2. Difusera une lettre:

3.2.1. Expossant la situation;

3.2.2. Invitant instamment les administrations à lui faire parvenir des propositions sur les moyens de faire face à cette situation;

4. Que, à l'aide des renseignements ainsi rassemblés, le secrétaire général établira et présentera à la prochaine conférence administrative mondiale des radiocommunications compétente un rapporte comportant ses commentaires et suggestions.

DG

RÉSOLUTION Nº 14

Relative au transfert de technologie

La Conférence administrative mondiale des radiocommunications (Genéve, 1979),

considérant

a) Les termes de la Résoluiton relative au Dèveloppement et à la Coopération internationale (Nº 3362.S-VIII) adoptée par l'Assemblée générale des Nations Unies lors de sa Septiéme session extraordinaire, ainsi que les termes de la section III de cette Résolution qui met l'accent sur le rôle de la science et de la technologie au service du développement;

b) Les termes de la Resolution 32/160 de l'Assemblée générale qui proclame une Décennie des transports et des communications en Afrique durant la période 1978-1987 et qui envisage qu'une année de cette Décennie soit proclamée Année mondiale des communications;

c) Les décisions de l'Assemblée générale concernant la préparation d'une Startégie internationale pour le développement au cours de la Troisième Décennie des Nations Unies pour le Développement, pour les annés 1980 (Résolution 33/193);

notant

que, lors de la récente Conférence des Nations Unies relative à l'application de la science et de la technologie au développement (Vienne, août 1979), les gouvernements ont adopté une Déclaration relative à un Programme d'action, en vue d'accélérer l'application de la science et de la technologie pour le développement;

consciente

de l'importance que revêt l'application de la science et de la technologie dans le domaine des télecommunications, aux fins du développement des services et de la réalisation d'objectifs sociaux, économiques et culturels;

consciente également

de l'importance du rôle de l'UIT en tant qu'institution spécialisée des Nations Unies chargée d'entreprendre des actions pour la réalisation des objectifs énoncés dans la Convention internationale des télécommunications;

décide d'inviter instamment

1. Les gouvernements des pays Membres, notamment ceux des pays en développement, et leurs administrations à faire en sorte que soient élaborées des politiques de développement des télécommunications au niveau national, afin de renforcer leurs activités de coopération technique en vue de la réalisation d'un transfert efficace de la technologie des télécommunications, de toute nature en particlier dans le domaine des radiocommunications;

2. Les administrations à participer au maximum, dans la mesure pratiquement possible, aux Commissions d'études des Comités consultatifs internationaux de l'Union, forums importants pour le transfert de l'information sur le progrès et l'application des télécommunications à la tecnhologie;

décide de charger le secrétaire général

1. D'intensifier encore les activités de coopération technique visant à la planification, à l'établissement, à la maintenance et à l'exploitation des systèmes de télécommunication, ainsi qu'à la formation du personnel à ces fins, en veu d'accélérer le transfert et la bonne application de la techonologie en faveur du développement, compte tenu des besoins porpres à chaque pays;

2. De rechercher, sur le plain international, des ressources pour favoriser l'accélération de ces programmes d'action en matière de coopération technique, notamment des fonds qui pourraient être dégagés dans le cadre du Programme d'action de Vienne;

3. De porter la présente Résolution à la connaissance de tous les pays Membres de l'Union et des organes compétents des Nations Unies;

invite le conseil d'administration

à suivre les progrès accomplis dans la réalisation des objectifs énoncés par la présente Résolution et à faire rapport sur ces progrès, en tant que de besoin, à la prochaine Conférence de plénipotentiaires.

CZ

RÉSOLUTION Nº 15

Relative à la coopération internationale et à l'assistance technique dans le domaine des radiocommunications spatiales (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'un grand nombre de pays Membres de l'Union internationale des télécommunications ne sont pas en mesure de bénéficier dans l'immédiat des avantages fournis par la technique des satellites pour le développement de leurs services de télécommunication;

b) Que ces pays pourraient tirer de très grands avantages des programmes d'assistance technique exécutés sous les auspices de l'Union;

notant

a) Que les systèmes internationaux de télécommunications par satellite sont assujettis aux dispositions de la Convention et des Règlements de l'Union et que tous les pays, y compris notamment les pays en développement, peuvent de ce fait participer aux systèmes de télécommunications spatiales;

b) Qu'un certain nombre de problèmes devront être résolus afin que les pays en développement puissent participer effectivement aux systèmes internationaux de télécommunications spatiales et intégrer ces systèmes à leurs réseaux de télécommunications nationaux;

décide d'inviter el conseil d'administration

1. À attirer l'attention des administrations sur les moyens leur permettant de bénéficier d'une assistance techniques dans le domaine de la mise en œuvre des télécommunications spatiales;

2. À étudier la meilleure manière dont les pays Membres de l'Union pourraient formuler et présenter des demandes d'assistance afin de recevoir le maximum d'aide sous formes financière et autre;

3. À étudier la meilleure manière dont pourraient être utilisés les fonds rendus disponibles par l'Organisation des Nations Unies en application de sa Résolution Nº **1721,** afin d'accorder une assistance sous formes technique et autre aux administrations des pays Membres de l'Union, afin que celles-ci puissent utiliser effectivement les télécommunications spatiales;

4. À étudier le moyen par lequel les travaux des Comités consultatifs et autres organismes de l'Union pourraient être utilisés de la maniére la plus efficace pour fournir aux administrations des pays Membres de l'Union des renseignements et une assistance pour le développement des radiocommunications spatiales.

---

(1) Remplace la Résolution Nº Spa 4 de la Conférence administrative extraordinaire des radiocommunications (Génève, 1963).

CX

RÉSOLUTION Nº 16

Relative au rôle des télécommunications dans le développement rural intégré

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

rappelant

la Résolution 3362 (S-VIII) de la Septième session extraordinaire de l'Assemblée générale des Nations Unies qui a, entre autres choses, demandé aux États Membres d'encourager le développement rural intégré dans les pays en développement;

rappelant en outre

l'importance donnée au développement rural par diverses conférences intergouvernementales au cours de la deuxième Décennie des Nations Unies pour le développement, qui ont reconnu la nécessité d'intensifier les efforts de développement visant à satisfaire les aspirations des communautés rurales et à accélérar le développement de l'infrastructure dans les zones rurales;

Les Résolutions Nº 779 (Application de la stratégie internationale du développement pour la deuxième Décennie des Nations Unies pour le développement) et Nº 800 (Les télécommunications — un facteur important du développement économique et social — rôle joué par l'UIT dans ce domaine) du Conseil d'administration de l'Union et l'importance des télécommunications pour le développment social et économique, de même que les divers projets et études enterpris par l'Union pour atteindre ces objectifs;

convaincue

de l'importance des télécomunications en tant qu'élément essential de l'infrastructure des zones rurales;

reconnaisant

a) Que la plupart des pays en développement manquent encore de ressources appropriées dans le domaine des télécommunications;
b) Qu'actuellement de nombreuses régions rurales du monde ne bénéficient pas des avantages de la technique des télécommunications;
c) Que les populations de nombreux pays vivent isolées les unes des autres en raison d'obstacles géographiques tels qu'océans, montagnes, forêts et déserts;
d) Que les télécommunications modernes et, en particulier, les radiocommunications, y compris les techniques spatiales, peuvent contribuer à surmonter ces difficultés et à intégrer les communautés rurales au processus de développement;
e) Que de nombreux pays en développement ne sont pas en mesure d'établir entièrement, au moyen de leurs propres ressources, des réseaux modernes de télécommunication;

notant

les possibilités démontrées des techniques modernes des télécommunications, qui offrent le moyen d'apporter aux zones rurales les services d'enseignement, de santé et de protection sociale, facteurs importants pour le développement social;

notant en outre

qu'un réseau rural adéquat de télécommunications peut largement contribuer à stimuler le développement des activités agricoles et celui d'autres secteurs importants pour le progrès économique et social;

en appelle instamment aux gouvernements des pays Membres

afin qu'ils intensifient leurs efforts dans le domaine de la coopération technique en veu du développement accéléré des télécommunications au profit des communautés rurales, en tenant compte des ressources insuffisantes de divers pays en développement;

en appelle en outre instamment aux administrations

afin qu'elles participent activement aux études effectuées par les groupes autonomes spécialisés (GAS 3 et GAS 5) du CCITT/CCIR en ce qui concerne le développement des télécommunications rurales;

prie le secrétaire général

1. De continuer à accorder une attention particulière aux activités d'assistance technique de l'Union en vue de la planification détaillée, de l'exploitation et de la manitenance de l'infrastructure des télécommunications rurales et de l'application des tecnhiques appropriées;
2. De porte la présente Résolution à l'attention des organes compétents des Nations Unies; et

3. De continuer à coopérer avec les institutions spécialisées et les organisations du système des Nations Unies dans le domaine du développement rural intégré;

invite le conseil d'administration

à examiner la présente Résolution, à veiller à sa mise en application et à rendre compte des progrès réalisés à cet égard dans le Rapport annuel sur les activités de l'Union.

DF RÉSOLUTION N° 17

Relative à la detérmination de la structure des commissions que pourra établir une conférence administrative des radicommunications en fonction de son ordre du jour

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que certaines administrations, ne disposant pas d'un perssonel suffisant, éprouvent des difficultés à constituer les délégations qui les représenteront aux conférences administratives des radiocommunications, à raison d'un délégué au moins par commission formée;

b) Qu'il est aujourd'hui difficile aux administrations de prévoir le nombre et l'appellation des commissions qui seront constituées à chaque conférence avant la réunion de celle-ci, ainsi que les sujets qu'il conviendra d'attribuer à chacune;

c) Que l'expérience acquise lors de conférences précédentes pertinentes montre qu'il est souhaitable que le secrétaire général prépare suffisamment à l'avance un projet de structuration pour les conférences à venir;

reconnaissant

a) Que l'organisation des travaux d'une conférence administrative des radiocommunications ne peut être décidée que par cette conférence en fonction de son ordre du jour et des propositions et des autres documents qui lui sont soumis;

b) Que, cependant, l'organisation des conférences antérieures peut fournir une orientation utile pour celle d'une nouvelle conférence, et que les renseignements relatifs à l'organisation des travaux des conférences passées peuvent, par conséquent, faciliter aux administrations les préparatifs en vue des conférences futures;

décide

1. Qu'une fois l'ordre du jour d'une conférence administrative des radiocommunications fixé par le Conseil d'administrations, le secrétaire général envoie aux administrations, en même temps qu'un exemplaire de la résolution contenant cet ordre du jour, une invitation à faire part de leur opinion sur la structure que devrait avoir la conférence, compte tenu de l'ordre du jour;

2. Qu'après avoir reçu la réponse des administrations, le secrétaire général élabore pour la conférence, en consultation avec l'IFRB et le Directeur du CCIR et compte tenu de l'expérience acquise lors de conférences antérieures de caractère analogue un projet de structure indiquant, en même temps que les commissions suggérés, les articles, appendices, résolutions, recommandations et autres sujets contenus dans l'ordre du jour qui doivent être traités par chaque commission;

3. Que le secrétaire général informera de ce projet de document le Conseil d'administration et l'enverra comme document d'information à toutes les administrations.

CU RÉSOLUTION N° 30

Relative à la révision d'inscriptions du Fichier de référence international des fréquences, à la demande de conférences antérieures

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la Conférence administrative extraordinaire des radiocommunications (Génève, 1951), a adopté une Liste internationale des fréquences dans laquelle figuraient des inscriptions non conformes au Tableau de répartition des bandes de fréquences d'Atlantic City (1947);

b) Que la Conférence administrative des radiocommunications (Génève, 1959), a indroduit les concepts de service primaire et de service secondaire, modifiant ainsi le Tableau de répartition des bandes de fréquences d'Atlantic City (1947), et privant certaines inscriptions de la Liste internationale des fréquences de leur caractère prioritaire;

c) Que la Conférence administrative des radiocommunications (Génève, 1959), dans l'établissement du Fichier de référence international des fréquences, a considéré et traité de façon spéciale le transfert de ces inscriptions du Fichier de référence des fréquences conformément aux dispositions de la Résoloution N° 4 (Génève, 1959);

d) Que, dans la période comprise entre le 1er janvier 1952 et le 31 mars 1953, des assignations ont été introduites dans cette Liste sans examen, avc un symbole dans la colonne 2d et que le Comité tient compte de ces assignations lors de l'examen de toute fiche de notification;

considérant en outre

e) Que les administrations avaient été instamment priées ded prendre les mesures requises;
f) Que la présente Conférence avait été invitée à réexaminer la situation;

décide

1. Que le Comité examine, du point de vue de leur conformité avec le nouveau Tableau d'attribution des bandes de fréquences, les assignations de fréquence auxquelles la Résolution Nº 4 de la Conférence des radiocommunications (Génève, 1959) était appliquée et corrige en conséquence ses conclusions à compter de la date d'entrée en vigueur des Actes finals de la présente Conférence. Lorsqu'une telle conclusion est modifiée en application de la présente Résolution, une remarque appropriée est inscrite dans la colonne Observations;

2. Que les assignations comportant un symbole dans la colonne 2d, qui ne sont pas couvertes par la Résolution 9 seront examinées en vue de remplacer ce symbole par la date du 1er avril 1953;

3. Que le Comité fera connaître aux administrations intéressées les mesures qu'il aura prises à propos de leurs assignations inscrites dans la Liste.

CI RÉSOLUTION N.º 31

Relative à l'application de certaines dispositions des Actes finals de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) pour tenir compte des modifications apportées par la Conférence administrative mondiale des radiocommunications (Génève, 1979) au tableau d'attribution des bandes de fréquences pour la Région 2, dans la bande 11,7-12,7GHz.

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971) a attribué, dans la Région 2, la bande de fréquences 11,7-12,2 GHz au service fixe par satellite, au service de radiodiffusion par satellite, au service fixe, au service mobile (sauf mobile aéronautique) et au service de radiodiffusion;
b) Que la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) a établi des dispositions et un Plan associé pour le service de radiodiffusion par satellite dans la bande 11,7-12,5 GHz (Région 1) et dans la bande 11,7-12,2 GHz (Région 3);
c) Que cette Conférence a aussi défini des critères de partage interrégionaux sur la base des attributions de bandes de fréquences alors en vigueur;
d) Que les attributions de bandes de fréquences au service fixe par satellite et au service de radiodiffusion par satellite, dans la bande des 12 GHz dans la Région 2, ont été élargies et modifiées par la présent Conférence;
e) Que la présente Conférence a aussi décidé d'incorporer les dispositions et le Plan associé adoptés par la Conférence de 1977 dans le Règlement des radiocommunications en tant qu'appendice 30;

reconnaissant

a) Que ces modifications du Tableau d'attribution des bandes de fréquences n'entraînent, en principe, pas de nouveaux cas de partage interrégionaux autres que le cas visé au point *b)* ci-dessous;
b) Que les dispositions de l'appendice 30 peuvent être appliquées directement, comme indiqué ci-dessus, à tous les cas de partage autres que le partage entre le service fixe par satellite dans les Régions 1 et 3 et le service de radiodiffusion par satellite dans la Région 2, dans la bande de fréquences 12,2-12,7 GHz;
c) Que le cas unique visé au *reconnnaissant b)* ci-dessust fait l'objet de la Résolution **700**;

décide

1. Que les dispositions de l'article 4 et l'annexe 1 de l'appendice 30 relatives à la modification du Plan établi pour le service de radiodiffusion par satellite dans les Régions 1 et 3 s'appliquent aussi à la protection du service de radiodiffusion par satellite dans la bande 12,2-12,5 GHz, et du service fixe par satellite dans la bande 12,2-12,3 GHz, attribuées à ces services dans la Région 2;

2. Que les dispositions de l'article 6 et l'annexe 3 de l'appendice 30 relatives à la procédure de coordination et de notification des assignations de fréquence aux stations de Terre qui affectent des assignations de fréquences aux stations du service de radiodiffusion par satellite, s'appliquent aussi dans la bande 12,2-12,7 GHz, en ce qui concerne le service de radiodiffusion par satellite dans la Région 2;

3. Que les dispositions de l'article 7 et l'annexe 4 de l'appendice 30, ainsi que la Résolution **503**, relatives aux procédures préliminaires et à la coordination, notification et inscription des assignations de fréquence aux stations du service

fixe par satellite et du service de radiodiffusion par satellite dans la Région 2, s'appliquent aussi à la bande 12,2-12,3 GHz attribuée au service fixe par satellite et à la bande 12,2-12,5 GHz attribuée au service de radiodiffusion par satellite dans la Région 2;

4. Que les dispositions de l'article 9 et l'annexe 5 de l'appendice 30 qui spécifient les valeurs limites de la puissance surfacique entre 11,7 GHz et 12,2 GHz pour protéger les services de Terre dans les Régions 1 et 3 contre les émissions des stations spatiales du service de radiodiffusion par satellite dans la Région 2, s'appliquent aussi à la bande 12,2-12,5 GHz;

5.Que, jusqu'à ce que la conférence régionale de 1983 pour la Région 2 prenne des décisions finales concernant la bande 12,5-12,7 GHz:

a) L'article 9 et les valeurs limites indiquées dans l'annexe 5, alinéa 1), de l'appendice 30 s'appliqueront aux stations spatiales du service de radiodiffusion par satelllite fonctionnant dans la Région 2, et

b) Les valeurs limites de la puissance surfacique indiquée au numéro **2574** s'appliqueront aux stations spatiales du service fixe par satellite, fonctionnant dans la Région 2, en ce qui concerne les pays mentionnés aux numéros **848** et **850** et en Région 3;

demande au CCIR

1. D'étudier d'urgence la question de la protection adéquate des services de Terre dans chaque Région influencée, dans la bande 12,2-12,7 GHz, en vue d'assuer la planification efficace du service de radiodiffusion par satellite dans la Région 2 conformément aux points 4 et 5 du dispositif de la présente Résolution;

2. D'établir un rapport spécial sur la question en temps voulu pour pouvoir être examiné par les réunions préparatoires compétentes et fournir des directives pour les travaux de ladite conférence régionale.

AI RÉSOLUTION Nº 32

Relative à l'utilisation des assignations de fréquence aux stations de radiocommunication de Terre et de radiocommunication spatiale dans les bandes 11,7-12,2 GHz dans la Région 3 et 11,7-12,5 GHz dans la Région 1 (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977), a adopté la Résolution Nº Sat-2;

b) Que, selon les dispositions du numéro **838** du Règlement des radiocommunications, le service fixe, le service mobile et le service de radiodiffusion existants et futurs fonctionnant dans la bande 11,7-12,2 GHz dans la Région 3 et dans la bande 11,7-12,5 GHz dans la Région 1 ne doivent pas causer de brouillage préjudiciable aux stations de radiodiffusion par satellite fonctionnant conformément aux décisions de ladite Conférence;

c) Que les décisions de ladite Conférence comprennent un Plan pour les stations du service de radiodiffusion par satellite;

d) Que les procédures de coordination prévues dans la Résolution **33** ne devront être appliquées que jusqu'à la date d'entrée en vigueur des plans établis en exécution de la Résolution **507**;

décide

1. Que toutes les administrations qui utilisent ou envisagent d'utiliser des assignations de fréquences à des stations de Terre dans les bandes couvertes par les Plan détermineront, dès que possible, si ces assignations affectent ou non les assignations de fréquence conformes au Plan (avec, si nécessaire, l'assistance de l'IFRB);

2. Que les administrations pourront continuer à utiliser des assignations de fréquence non conformes au Plan de radiodiffusion par satellite, à condition qu'elles se mettent d'accord avec les administrations dont les stations de radiodiffusion par satellite sont affectées;

3. Que les administrations désirant conclure un accord communiqueront la teneur de cet accord à l'IFRB;

4. Qu'à la réception de ces renseignements, l'IFRB inscrira un symbole dans la colonne «Observations» du Fichier de référence, pour indiquer la durée spécifiée dans l'acoord, laquelle devra être également publiée dans une section spéciale de la circulaire hebdomadaire de l'IFRB;

5. Que la Résolution Nº Sat-2 est abrogée et remplacée par la présente Résolution;

invite l'IFRB

à apporter son assistance aux administrations pour leur permettre d'appliquer les dispositions de la présente Résolution.

---

(1) Remplace la Résolution N.º Sat-2 de la Conférence administrative des radiocommunications pour la radiodiffusion par spatiales (Génève, 1977).

BO

RÉSOLUTION Nº 33

Relative à la mise en service de stations spatiales du service de radiodiffusion par satellite avant la mise en vigueur vigueur d'accords et de plans associés pour le service de radiodiffusion par satelite (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la Résolution **507** en visage l'établissement de plans pour le service de radiodiffusion par satellite, mais que quelques administrations peuvent cependant ressentir el besoin de mettre en service des stations de ce service avant l'établissement de ces plans;

b) Qu'il convient que les administrations évitent, dans la mesure du possible, la prolifération de stations spatiales du service de radiodiffusion par satellite avant que de tels plans aient été établis;

c) Qu'une station spatiale du service de radiodiffusion par satellite est susceptible de causer des brouillages préjudiciables aux stations de Terre fonctionnant dans la même bande de fréquences, même si ces dernières stations sont situées en dehors de la zone de service de la stations spatiale;

d) Que les procédures spécifiées à l'article 11 du Règlement des radiocommunications ne contiennent pas de dispositions concernant la coordination entre stations spatiales du service de radiodiffusion par satellite et stations de Terre, ni entre stations spatiales du service de radiodiffusion par satellite et systèmes statiaux relevant d'autres administrations;

décide

1. Que, sauf lorsque des accords et des plans associés pour le service de radiodiffusion par satellite ont été établis et mis en vigueur, la procédure suivante sera appliquée:

SECTION A

Procédure de coordination entre stations spatiales du service de radiodiffusion par satellite et stations de Terre

2.1. Avant de notifier à l'IFRB ou de mettre en service une assignation de fréquence à une stations spatiale du service de radiodiffusion par satellite dans une bande de fréquences, lorsque cette bande de fréquences est attribuée, avec égalité de droits, au service de radiodiffusion par satellite et à un service de radiocommunications de Terre, soit dans la même Région ou sous-Région, soit dans des Régions ou sous-Régions différentes, une administration coordonne l'utilisation de cette assignation avec toute autre administration dont les services de radiocommunications de Terre sont susceptibles d'être affectés. A cet effet, elle communique au Comité toutes les caractéristiques techniques de cette station telles qu'elles sont énumérées dans les sections pertinentes de l'appendice 3 au Règlement des radiocommunications, qui sont nécessaires pour évaluer les risques de brouillage à un service de radiocommunication de Terre (1).

2.2. Le Comité publie ces renseignements dans une section spéciale de sa circulaire hebdomadaire et, lorsque la circulaire hebdomadaire contient des renseignements de cette nature, il en avise des administrations par télégramme-circulaire.

2.3. Toute administration qui estime que ses services de radiocommunication de Terre sont susceptibles d'être affectés présente ses observations à l'administration qui recherche la coordination et, dans tous les cas, au Comité. Ces observations doivent être envoyées dans un délai de quatre mois à compter de la date de la circulaire hebdomadaire pertinente de l'IFRB. Toute administration n'ayant pas fait connaître ses observations dans ce délai est réputée avoir considéré que ses services de radiocommunication de Terre ne sont pas susceptibles d'être affectés.

2.4. Toute administration qui a émis des observations sur la station en projet doit, soit communiquer son accord, avec une copie au Comité, soit, si cela n'est pas possible, envoyer à l'administration qui recherche la coordination toutes les données sur lesqueles ses observations sont fondées ainsi que toutes les suggestions qu'elle peut faire en vue d'une solution satisfaisante du probléme.

2.5. L'administration qui projette de mettre en service une station spatiale du service de radiodiffusion par satellite ainsi que toute autre administration estimant que ses services de radiocommunication de Terre sont susceptibles d'être affectés par la station en question peuvent demander l'aide du Comité à tout moment au cours de la procédure de coordination.

2.6. En cas de désaccord persistant entre l'administration qui recherche la coordination et l'administration auprès de laquelle la coordiantion a été recherchée, l'administration qui recherche la coordination diffère, excepté dans les cas où l'assistance du Comité a été demandée, l'envoi au Comité de sa fiche de notification concernant l'assignation en projet, de six mois à compter de la date de publication des renseignements dont il est question au paragraphe 2.2.

---

(1) Remplace la Résolution Nº Sat-3 de la Conférence administrative des radiocommunications pour la radiodiffusion par spatiales (Génève, 1977).

(2) Il convient que les méthodes de calcul et les critères de brouillage à utiliser pour évaluer de brouillage soient fondés sur les Avis pertinents du CCIR acceptés par les administrations concernées en application de la Résolution **703** ou d'une autre façon. En cas de désaccord sur un Avis du CCIR ou en l'absence de tels Avis, les méthods et les critères font l'objet d'accords entre les administrations concernées. Ces accords doivent être réalisés sans porter préjudice aux autres administrations.

SECTION B

Procédure de cordination entre stations spatiales du service de radiodiffusion par satellite et systèmes spatiaux relevant d'autres administrations

3. Une administration qui a l'intention de mettre en service une station spatiale du service de radiodiffusion par satellite applique, aux fins de la coordination avec les systèmes spatiaux d'autres administrations, les dispositions suivantes de l'article 11 du Règlement des radiocommunications:

3.1. Numéros **1041** à **1058** inclus:

3.2.1. Numéros **1060** à **1065** (1).

3.2.2. Aucune coordination aux termes du paragraphe 3.2.1 n'est requise lorsqu'une administration se propose de modifier les caractéristiques d'une assignation existante d'une manière telle que la probabilité de brouillages préjudiciables causés à des stations du service de radiocommunication spatiale d'autres administrations ne s'en trouve pas accrue.

3.2.3. Numéros **1074** à **1105** inclus.

SECTION C

Notification, examen et inscription dans le Fichier de référence des assignations aux stations spatiales du service de radiodiffusion par satellite traitées dans la présente Résolution

4.1. Toute assignation de fréquence (2) à une station spatiale du service de radiodiffusion par satellite doit être notifiée au Comité. L'administration notificatrice applique à cet effet les disposition des numéros **1495** à **1497** du Règlement des radiocommunication.

4.2. Les notifications faites aux termes du paragraphe 4.1 sont traitées initialement conformément aux dispositions du numéro **1498**.

5.1. Le Comité examine chaque fiche de notification:

5.2. — *a*) Du point de vue de sa conformité avec les clauses de la Convention, le Tableau d'attribution des bandes de fréquences et les autres clauses du Règlement des radicommunications, à l'exception de celles qui sont relatives aux procédures de coordination et à la probabilité de brouillages préjudiciables, qui font l'objet des alinéas 5.3, 5.4 et 5.5;

5.3. — *b*) Le cas échéant, du point de vue de sa conformité avec les dispositions du paragraphe 3.2.1 de la section A ci-dessus, lesquelles concernent la coordination de l'utilisation de l'assignation de fréquence avec les autres administrations intéressées;

5.4. — *c*) Le cas échéant, du point de vue de sa conformité avec les dispositions du paragraphe 3.2.1 de la section B ci-dessus, lesquelles concernent la coordination de l'utilisation de l'assignation de fréquence avec les autres administrations intéressées;

5.5. — *d*) Le cas échéant, du point de vue de la probabilité d'un brouillage préjudiciable au détriment du service assuré par une station d'un service de radiocommunications spatiales ou d'un service de radiocommunications de Terre pour laquelle a déjà été inscrite dans le Fichier de référence une assignation de fréquence conforme aux dispositions des numéros **1240** ou **1503**, selon le cas, du Règlement des radiocommunications si cette assignation de fréquence n'a pas, en fait, causé de brouillage préjudiciable au service assuré par une station ayant fait l'objet d'une assignation antérieurement inscrite dans le Fichier de référence et qui est elle-même conforme aux numéros **1240** ou **1503**, selon le cas.

6.1. Selon des conclusion auxquelles le Comité parvient à la suite de l'examen prévu aux paragraphes 5.2, 5.3, 5.4 et 5.5 la procédure se poursuit comme suit:

6.2. Lorsque le Comité formule une conclusion défavorable relativement au paragraphe 5.2, la fiche de notification est retournée immédiatement par poste aérienne à l'administration notificatrice, avec un exposé des raisons qui motivent la conclusion du Comité, et avec les suggestions qu'il peut faire, en vue d'arriver à une solution satisfaisant du problème.

6.3. Lorsque le Comité formule une conclusion favorable relativement au paragraphe 5.2 ou lorsqu'il formule la même conclusion après que la fiche de notification a été présentée à nouveau, il examine la fiche relativement aux dispositions des paragraphes 5.3 et 5.4.

6.4. Lorsque le Comité conclut que les procédures de coordination dont il est question aux paragraphes 5.3 et 5.4 ont été appliquées avec succès en ce qui concerne touts les administrations dont les services peuvent être affectés, l'assignation est inscrite dans le Fichier de référence. La date de réception par le Comité de la fiche de notification est inscrite dans la colonne 2d du Fichier de référence, avec une observation dans la colonne Observations indiquant que cette inscription ne préjuge en aucune façon les décisions à inclure dans les accords et plans associés dont il est question dans la Résolution **507**.

6.5. Lorsque le Comité conclut que les procédures de coordination dont il est question aux paragraphes 5.3 ou 5.4 n'ont, selon le cas, pas été appliquées sans succès, la fiche de notification est renvoyée immédiatement par poste aérienne à l'administration notificatrice avec un exposé des raisons qui motivent ce renvoi et avec les suggestions que le Comité peut faire en vue d'arriver à une solution satisfaisante du problème.

---

(1) Il convient que les méthodes de calcul et les critères de brouillage à utiliser pour évaluer de brouillage soient fondes sur les Avis pertinentes du CCIR acceptés par les administrations concernées en application de la Résolution **703** ou d'une autre façon. En cas de désaccord sur un Avis du CCIR ou en l'absence de tels Avis, les méthodes et les critères font l'objet d'accords entre les administrations concernées. Ces accords doivent être réalises sans porter préjudice aux autres administrations.

(2) L'expression «assignation de fréquence», partout où elle figure dans la présente Résolution, doit être entendue comme se référant soit à une nouvelle assignation de fréquence. soit à une modification à une assignation déjà inscrite dans le Fichier de référence international des fréquences (denommé ci-après le «Fichier de référence»).

6.6. Lorsque l'administration notificatrice présente à nouveau sa fiche de notification en déclarant qu'elle n'a pas eu de succès en tentant d'effectuer la coordination, le Comité examine la fiche du point de vue du paragraphe 5.5.

6.7. Lorsque l'administration notificatrice présente à nouveau sa fiche de notification et si le Comité conclut que les procédures de coordination ont été appliquées avec succès en ci que concerne toutes les administrations dont les services peuvent être affectés, l'assignation est traitée comme il est indiqué au paragraphe 6.4.

6.8. Lorsque le Comité formule une conclusion favorable relativement au paragraphe 5.5, l'assignation est inscrite dans le Fichier de référence. Le symbole approprié représentant la conclusion du Comité indique que, le cas échéant, les procédures de coordination dont il est question aux pagraphes 2.1 ou 3.2.1 n'ont pas été couronnés de succès. La date de réception par le Comité de la fiche de notification est inscrite dans la colonne 2d du Fichier de référence, avec l'observation mentionnée au paragraphe 6.4.

6.9. Lorsque le Comité formule une conclusion défavorable relativement au paragraphe 5.5, la fiche de notification est retournée immédiatement par poste aérienne à l'administration notificatrice, avec un exposé des raisons qui motivent la conclusion du Comité, et avec les suggestions qu'il peut faire en vue d'arriver à une solution satisfaisant du problème.

6.10. Si l'administration présent de nouveau sa fiche non modifiée et si elle insiste pour un nouvel examen de cette fiche, mais si la conclusion du Comité relativement au paragraphe 5.5 reste la même, l'assignation est inscrite dans le Fichier de référence. Mais cette inscription n'est faite que si l'administration notificatrice avise le Comité que l'assignation a été en service pendant au moins quatro mois sans qu'aucune plainte en brouillage préjudiciable en soit résultée. La date de réception par le Comité de la fiche de notification originale est inscrite dans la colonne 2d du Fichier de référence avec l'observation mentionnée au paragraphe 6.4. Une observation appropriée est inscrite dans la colonne 13 pour indiquer que l'assignation n'est pas conforme aux dispositions des paragraphes 5.3, 5.4 ou 5.5 selon le cas. Dans le cas ou l'administration intéressée ne reçoit aucune plainte en brouillage préjudiciable concernant le fonctionnement de la station en question pendant une période d'une année après sa mise en service, le Comité réexamine sa conclusion.

6.11. Si l'utilisation d'une assignation de fréquence à une station spatiale qui a été inscrite dans le Fichier de référance conformément aux dispositions du paragraphe 6.10 de la présente Résolution ou du numéro **1544** cuase effectivement un brouillage préjudiciable à la réception d'une station spatiale du service de radiodiffusion pour laquelle une assignation de fréquence a été antérieurement inscrite dans le Fichier de référence à la suite d'une conclusion favorable relativement aux paragraphes 5.2, 5.3, 5.4 et 5.5 de la présente Résolution, selon le cas, la station brouilleuse doit faire cesser immediatement le brouillage préjudiciable lorsque'elle est avisée dudit brouillage.

6.12. Si l'utilisation d'une assignation de fréquence à une spatiale du service de radiodiffusion par satellite qui a été inscrite dans le Fichier de référence conformément aux dispositions du paragraphe 6.10 de la présente Résolution cause effectivement un brouillage préjudiciable à la réception d'une station de radiocommunication spatiale pour laquele une assignation de fréquence a été antérieurement inscrite dans le Fichier de référence à la suite d'une conclusion favorable relativement aux numéros **1503** à **1512**, selon le cas, la station brouilleuse soit faire cesser immédiatement le brouillage préjudiciable lorsqu'elle est avisée dudit brouillage.

6.13. Si l'utilisation d'une assignation de fréquence à une station spatiale du service de radiodiffusion par satellite qui a été inscrite dans le Fichier de référence conformément aux dispositions du paragraph 6.10 de la présent Résolution cause effectivement un brouillage préjudiciable à la réception d'une station de Terre pour laquelle une assignation de fréquence a été antérieurement inscrite au Fichier de référence à la suite d'une conclusion favorable relativement au numéro **1240,** la station brouilleuse doit faire cesser immédiatement le brouillage préjudiciable lorsqu'elle est avisée dudit brouillage.

6.14. Si l'utilisation d'une assignation de fréquence non conforme aux dispositions des numéros **1240, 1352** ou **1503** cause effectivement un brouillage préjudiciable à la réception d'une station quelconque fonctionnant conformément aux dispositions du paragraphe 5.2 de la présente Résolution, la station utilisant l'assignation de fréquence non conforme aux dispositions des numéros précités doit faire cesser immédiatement le brouillage préjudiciable lorsqu'elle est avisée dudit brouillage.

CL

RÉSOLUTION N° 34

Relative à l'établissement de services de radiodiffusion par satellite dans la bande 12,5-12,75 GHz (Région 3) et au partage avec les services spatiaux et de Terre (Régions 1, 2 et 3)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

qu'elle a attribué la bande 12,5-12,75 GHz au service de radiodiffusion par satellite, aux fins de réception communautaire dans la Région 3;

reconnaissant

qu'aux termes de la Résolution **507,** le Conseil d'administration voudra peut-être habiliter une future conférence administrative des radiocommunications compétente à établir un plan pour le service de radiodiffusion par satellite dans la bande 12,5-12,75 GHz dans la Région 3;

décide

1. Que, jusqu'à ce qu'un plan soit établi pour le service de radiodiffusion par satellite dans la bande 12,5-12,75 GHz dans la Région 3, les dispositions de la Résolution **33** et l'article 11 continueront à s'appliquer à la coordination entre les stations du service de radiodiffusion par satellite dans la Région 3 et:

1) Les stations spatiales du service de radiodiffusion par satellite et du service fixe par satellite dans les Régions 1, 2 et 3;
2) Les stations de Terre dans les Régions 1, 2 et 3;

2. Qu'il convient que le CCIR étudie d'urgence les dispositions techniques qui pourront être appropriées au partage entre les stations du service de radiodiffusion par satellite dans la Région 3 et:

1) Les stations spatiales du service de radiodiffusion par satellite et du service fixe par satellite dans les Régions 1 et 2;
2) Les stations de Terre dans les Régions 1 et 2;

3. Que, en attendant que des dispositions techniques soient élaborées par lè CCIR et acceptées par les administrations concernées aux termes de la Résolution **703,** le partage entre les stations spatiales du service de radiodiffusion par satellite dans la Région 3 et les services de Terre dans le Régions 1, 2 et 3 será fondé sur les critères suivants:

1) La puissance surfacique produite à la surface de la Terre par les émissions d'une station spatiale du service de radiodiffusion par satellite dans la Région 3, quelles que soient les conditions et les méthodes de modulation, ne doir pas dépasser les limites indiquées à l'annexe 5 de l'appendice **30** en notant que le sous-paragraphe 2 ne s'appliquera qu'à la protection du service de radiodiffusion;
2) En plus du critère 1), les dispositions du numéro **2574** doivent s'appliquer aux pays mentionnées aux numéros **848** et **850;**
3) Les limites indiquées aux points 1) et 2) ci-dessus peuvent être dépassées sur le territoire d'un pays, à condition que l'administration de ce pays l'ait accepté.

AA RÉSOLUTION N° 35

Relative à la procedure à suivre pour mettre fin à un désaccord au sujet des Normes techniques ou des Règles de procédure du Comité international d'enregistrement des fréquences

La Conference administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que, conformément aux dispositions du numéro **1001.1,** les Normes techniques et les Règles de procédure de l'IFRB sont communiquées à tous les Membres de l'Union et peuvent faire l'objet de commentaires des administrations;
b) Qu'une administration peut être en désaccord sur le fond de ces documents;
c) Qu'au cas où un désaccord ne pourrait être résolu, une procédure devrait permettre de surmonter les divergences;

reconnaissant

a) Qu'en ce qui concerne les Normes techniques, le CCIR pourrait constituer la meilleure source d'avis compétents;
b) Qu'en ce qui concerne les Règles de procédure, une conférence administrative mondiale des radiocommunications pourrait constituer la meilleure source d'interprétation du Règlement des radiocommunications;

décide

1. Qu'en cas de désaccord persistant sur le fond des Normes techniques de l'IFRB, le Comité avec l'accord de l'administration concernée pose la questions au CCIR aux fins d'études internationales et d'élaboration d'un Avis pertinent par l'Assemblée plénière du CCIR;

2. Que si le CCIR n'est pas en mesure un tel Avis ou s'il existe un désaccord sur le fond des Règles de procédure de l'IFRB, la question peut dans les deux cas être renvoyée au Conseil d'administration aux fins d'inscription à l'ordre du jour de la conférence administrative mondiale des radiocommunications suivante;

3. Qu'en attendant le règlement de la question, le Comité continue à appliquer la Norme technique ou la Règle de procédure en litige, mais qu'une fois la question résolue par un Avis du CCIR ou par une décision d'une conférence administrative mondiale des radiocommunications, le Comité prend sans délais les mesures qui s'imposent, y compris le réexamen de toutes les conclusions formulées en la matière.

AK RÉSOLUTION N° 36

Relative à l'établissement, par le Comité international d'enregistrement des fréquences, d'une documentation explicative au sujet de l'application de la nouvelle méthode de désignation des émissions dans les procédures de notification et à la révision du Fichier de référence international des fréquences qui en résulte.

La Conference administrative mondiale des radiocommunications (Génève, 1979),

ayant adopté

l'article 4 et l'appendice 6 contenant un nouveau système de désignation des émissions;

considerant

a) Que ces désignations revêtent une importance fondamentale pour les procédures de notification spécifiées dans le Règlement des radiocommunications;
b) Qu'il est essential que ce nouveau système ce désignation des émissions soit appliqué non seulement aux nouvelles assignations de fréquence mais également aux inscriptions existantes du Fichier de référence;
c) Que certaines nouvelles désignations sont plus détaillées que les anciennes;
d) Que l'IFRB n'a pas les moyens de remplacer automatiquement toutes les désignations anciennes par les nouvelles;

notant

a) Que certaines administrations pourront éprouver des difficultés à mettre en œuvre la nouvelle méthode de désignation des émissions lors de sa première application;
b) Que ces administrations auront besoin de renseignements explicatifs à ce sujet bien avant la date d'entrée en vigueur des Actes finals de la présente Conférence;

décide

1. Que l'IFRB établira une documentation explicative, comportant des exemples, au sujet de l'application de la nouvelle méthode de désignation, en vue de son utilisation dans les procédures de notification spécifiées dans le Règlement des radiocommunications et mettra cette documentation à la disposition des administrations le plus tôt possible et au plus tard le 1er octobre 1980;

2. Que l'IFRB procédera à la conversion des données inscrites dans le Fichier de référence en consultation avec les administrations et sur la base des renseignements qu'elles fourniront;

3. Qué si, dans un délai raisonnable, l'IFRB n'a pas reçu d'une administration les renseignements visés au paragraphe 2, il convertira les données inscrites dans le Fichier de référence aussi exactement que possible et ajoutera, dans la colonne Observations, une remarque mentionnant que la conversion a été effectuée conformément au présent alinéa;

4. Que, à dater de l'entrée en vigueur de la présente révision du Règlement des radiocommunications, on n'utilisera pour les procédures de coordination et de notification que les désignations des émissions figurant dans l'article 4. Néanmoins, si le Comité reçoit ultérieurement des renseignements ou des notifications contenant l'ancien type de désignation, il ne les tiendra pas pour incomplets pour cette seule raison. Si c'est pratiquement possible, le Comité modifiera la désignation et, si des précisions sont nécessaires, il consultera l'administration intéressée.

BX RÉSOLUTION N° 37

Relative à la mise en œuvre et au développement de l'utilisation des techniques informatiques pour faciliter la gestion du spectre radioélectrique par les administrations

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) La Résolution **7** relative à mise au point de la gestion nationale du spectre radioélectrique;
b) La Résolution **6** relative à l'élaboration d'un manuel destiné à expliquer et à illustrer certaines dispositions du Règlement des radiocommunications;
c) La Recommandation **31** adressée au CCIR, relative à l'élaboration d'un manuel sur l'application des techniques informatiques à la gestion du spectre radioélectrique;

considérant en outre

d) La valeur potentielle des techniques informatiques pour le nombreux aspects de la gestion du spectre;
e) La nécessité d'une assistance complémentaire aux administrations, en particulier dans le pays en développement, pour leur permettre de mettre en œuvre et de développer les équipements informatiques ou d'exploiter d'une manière optimale leurs équipements informatiques existants en vue de la gestion du spectre radioélectrique;

décide que le secrétaire général

organisera rapidement un examen de ces problèmes pour faire en sorte que les mesures suivantes soient prises de la manière la plus efficace possible:

1. Organisation de cycles d'études régionaux consacrés, en particulier, à la formation dans ce domaine, compte tenu des besoins nationaux des administrations;

2. Utilisation de toutes les ressources pédagogiques dont dispose l'Union pour assurer une formation complémentaire dans ce domaine en fonction des besoins nationaux des administrations;

3. Établissement, dans le cadre des instances existantes de l'UIT, de dispositions appropriées destinées à aider les administrations à identifier les problèmes particuliers dans ce domaine et à y apporter des solutions en utilisant du mieux possible les techniques informatiques;

invite le conseil d'administration

à examiner les recommandations du Secrétaire général et à trouver les ressources nécessaires.

BR RÉSOLUTION Nº 38

Relative à la réassignation des fréquences aux stations des services fixe et mobile fonctionnant dans les bandes attribuées aux services de radiolocalisation et d'amateur dans la Région 1

(1625-1635 kHz, 1800-1810 kHz, 1810-1850 kHz et 2160-2170 kHz)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

que la présente Conférence a adopté des modifications à l'attribution des bandes de fréquences comprises entre 1606,5 kHz et 2850 kHz;

notant

a) Que la mise en œuvre du Tableau révisé d'attribution des bandes de fréquences présente des difficultés, en particulier pour les stations du service mobile maritime dans la Région 1, dans les bandes 1625-1635 kHz, 1800-1810 kHz et 2160-2170 kHz qui sont mises à la disposition des services de radiolocalisation et dans la bande 1810-1850 kHz qui est mise à la disposition du service d'amateur;

b) Que la présente Conférence a recommandé la convocation, en 1982 au plus tard, d'une conférence administrative des radiocommunicatios pour les services mobiles en général;

soulignant

la nécessité d'élaborer des plans d'assignation de fréquences pour la bande 1606,5-2850 kHz dans la Région 1, afin d'appliquer les dispositions des numéros **486** et **492** du Règlement des radiocommunications;

invite la conférence pour les services mobiles

mentionnée ci-dessus à donner la priorité à l'adoption d'un nouveau plan d'assignation de fréquences dans la bande 1606,5-2850 kHz pour le service mobile maritime dans la Région 1;

décide

1. Que dans la Région 1, exception faite des pays et des bandes de fréquences mentionnés (1) aux numéros **485**, **490**, **491**, **493** et **199**, à partir de la date d'entrée en vigueur du plan d'assignation de fréquences pour le service mobile maritime qui figurera dans les actes finals de la conférence compétente, il sera mis fin à toutes les opérations des stations des services fixe et mobile dans les bandes 1625-1635 kHz, 1800-1850 kHz et 2160-2170 kHz;

2. Que le plan d'assignation de fréquences mentionné ci-dessus indiquera les fréquences de remplacement pour les stations du service mobile maritime, ainsi que les dispositions relatives à leur mise en œuvre;

3. Que les administrations, au nom desquelles sont inscrites des assignations aux stations des services fixe, mobile terrestre ou mobile aéronautique (OR) dans les bandes concernées choisiront les assignations de remplacement appropriées et les notifieront à l'IFRB et que, lorsque la conclusion du Comité sera favorable relativement aux numéros **1240** et **1241**, l'assignation portera la même date et aura le même statut que celle qu'elle remplace en ce qui concerne les assignations des pays de la Région 1;

4. Que la protection assurée aux stations des services fixe et mobile conformément aux numéros **486** et **492** continuera à s'appliquer jusqu'à ce que des assignations de remplacement satisfaisantes aient été trouvées et mises en œuvre conformément aux dispositions de la présente Résolution;

5. Qu'à compter de la date de mise en œuvre du plan d'assignation de fréquence pour le service mobile maritime, contenu dans les actes finals de la conférence compétente, les assignations de fréquence qui n'auront pas été transférées conformement au point 3 du dispositif de la présente Résolution, ne continueront à fonctionner qu'au titre des dispositions du numéro **342.**

AJ RÉSOLUTION Nº 60

Relative aux renseignements sur la propagation des ondes radioélectriques utilisés pour déterminer la zone de coordination

(Voir l'appendice 28)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

---

(1) Nº **485**, bandes 1625-1635 kHz, 1800-1810 kHz et 2160-2170 kHz; Nº **490**, bande 1810-1830 kHz; Nº **491**, bande 1810-1830 kHz; Nº **493**, bande 1810-1850 kHz, et Nº **499**, bande 2160-2170 kHz.

considérant

a) Que l'appendice 28 au Règlement des radiocommunications décrit une méthode de détermination de la zone de coordination qui fait intervenir certaine documentation relative à la propagation des ondes radioélectriques;
b) Que les renseignements sur la propagation contenus dans cet appendice sont fondés, directement ou indirectement, sur des données de propagation figurant dans les textes du CCIR;
c) Que les études du CCIR sur la propagation se poursuivent, de sorte que leurs conclusions sont sujettes à modification et pourront dans l'avenir conduire à modifier les sections de l'appendice 28 dans lesquelles interviennent les renseignements sur la propagation;
d) Que, dans certains parties du monde, aucune mesure de la propagation des ondes radioélectriques n'a été effectuée;

reconnaissant

a) Qu'il faut généralement plusieurs années pour rassembler suffisamment de données afin de pouvoir en tirer des conclusions fiables au sujet de la propagation;
b) Que, pour des raisons administratives, il est souhaitable que les renseignements sur la propagation utilisés pour la détermination de la zone de coordination ne soient pas révisés trop fréquemment et, en tout état de cause, qu'ils ne le soient que si l'effet d'une telle révision sur les dimensions de la zone de coordination est suffisamment important;
c) Que la détermination de la zone de coordination effectuée selon l'appendice 28 ne nécessite pas une connaissance détaillée des caractéristiques de propagation sur des trajets individuels et qu'il est souhaitable que l'on continue à procéder de cette façon;

invite le CCIR

à poursuivre l'étude des données sur la propagation intéressant la détermination de la zone de coordination et à conserver aux textes correspondants une présentation qui permette leur insertion directe dans l'appendice 28 en remplacement des sections actuelles, 3, 4 et 6 ou de l'annexe III;

décide

1. Que toutes les Assemblées plénières du CCIR devront aboutir à une conclusion sur le point de savoir si, d'après les renseignements sur la propagation contenus dans les Avis les plus récents du CCIR, une révision des sections 3, 4, et 6 ou de l'annexe III de l'appendice 28 au Règlement des radiocommunications est justifiée;

2. Que, lorsqu'une Assemblée plénière du CCIR aura abouti à la conclusion qu'une révision des sections 3, 4 et 6 de l'annexe III de l'appendice 28 est justifiée, le Directeur du CCIR en informera le Secrétaire général de l'UIT et lui transmettra les modifications proposées à l'appendice 28.

demande

1. Que le Conseil d'administration inscrive alors à l'ordre du jour de la prochaine conférence administrative mondiale des radiocommunications un point extraordinaire portant sur l'examen de ladite conclusion du CCIR;

2. Que si la conférence administrative mondiale des radiocommunications précitée décide que les renseignements sur la propagation utilisés dans l'appendice 28 doivent être révisés, le Secrétaire général, en consultation avec l'IFRB, insère les amendements décidés par ladite conférence dans un document donnant le nouveau texte des sections 3, 4 et 6 ou de l'annexe III de l'appendice 28, publié sous une forme telle qu'on puisse directement le substituer à la version de l'appendice 28 alors en vigueur, et envoie ce document à toutes les administrations;

décide en outre

que, à compter d'une date que fixera ladite conférence, le texte révisé servira de base pour toutes les déterminations ultérieures de la zone de coordination au moyen de l'appendice 28.

BK RÉSOLUTION Nº 61

Relative à la division du monde en zones climatiques pour le calcul des caractéristiques de propagation

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la propagation des ondes radioélectriques, particulièrement fréquences supérieures à 1 GHz, est influencée de manière significative par le précipitation ainsi que par les tempêtes de sable et de poussière;
b) Que l'on ne dispose, pour certaines régions géographiques, ni de valeurs mesurées ni de statistiques à court terme concernant l'intensité des précipitations;
c) Qu'il existe très peu de données sur l'occurrence et sur les effets des tempêtes de sable et de poussière;

d) Que, pour l'évaluation des caractéristiques de propagation, le CCIR a divisé le monde en cinq zones hydrométéorologiques correspondant d'une manière générale aux caractéristiques des précipitations et que cette division n'est plus appropriée;

e) Que la division actuelle du monde en un nombre aussi réduit de zones hydrométéorologiques n'a vraisemblablement pas la précision voulue pour permettre une évaluation correcte de l'affaiblissement et de la diffusion par les précipitations dans certaines parties du monde;

f) Que les effets des tempêtes de sable et de poussière n'ont pas fait l'objet d'études et d'évaluations appropriées, quant à leur gravité ou quant à leurs variations dans le temps;

g) Que le CCIR affectue actuellement certains études sur les effets des précipitations et des tempêtes de sable et de poussière;

prie le CCIR

1. D'accélérer et de développer ses travaux sur les effets des précipitations et d'attacher plus d'importance à l'étude des tempêtes de sable et de poussière;

2. De donner de avis sur la nature des études nécessaires dans les régions géographiques pour lesquelles les données sont insuffisantes;

3. De porter une attention particulière, compte tenu des nouvelles données dont il pourra disposer, à la révision de la classification actuelle du monde en zones hydrométéorologiques;

invite instamment les administrations

1. À encourager et à entreprendre d'urgence dans leur pays des mesures des taux de précipitations et des variations dans l'espace et dans le temps de ces précipitations, notamment de leur structure cellulaire;

2. À encourager et à entreprendre, d'urgence également, des mesures de l'influence des tempêtes de sable et de poussière sur la propagation;

3. À communiquer les résultats de ces mesures au CCIR pour permettre à celui-ci de décrire de façon plus précise et plus détaillée les phénomènes qui entrent en jeu et d'établir une classification améliorée des tempêtes de sable et de poussière ainsi que des régions hydrométéorologiques pour application aux problèmes des radiocommunications.

AM

RÉSOLUTION Nº 62

Relative à l'utilisation expérimentale des ondes radioélectriques par les satellites de recherche ionosphérique (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la recherche sur l'ionosphère terrestre revêt une très grande importance pour l'étude des relations entre le Soleil et la Terre et également pour l'utilisation rationnelle des ondes radioélectriques se propageant par l'ionosphère;

b) Que l'on a effectué des recherches couronnées de succès avec des satellites tels qu'Alouette 1 et 2, ISIS 1 et 2 et ISS, munis d'appareils de sondage ionosphérique par le haut;

c) Que des satellites de recherche ionosphérique semblables à ceux cités ci-dessus, seront mis en œuvre pour poursuivre les recherches sur l'ionosphère et au-delà;

d) Que les appareils de sondage par le haut fonctionnent pour la plupart en régime d'impulsions avec balayage de fréquence;

e) Que les satellites dont il s'agit sont généralement utilisés par intermittence, pendant une fraction de la journée, selon les caractéristiques de l'orbite;

f) Que le système de sondage peut être télécommandé avec précision, à volonté, à partir de la station terrienne correspondante;

décide

que les administrations peuvent continuer à autoriser l'émission d'ondes radioélectriques à partir de satellites de recherche ionosphérique placés sur des orbites au-dessus de l'ionosphère dans les bandes d'ondes hectométriques et décamétriques, à condition que l'on dispose de moyens appropriés pour commander les émissions de ces satellites, comme le requiert le numéro **2612** du Règlement des radiocommunications afin d'empêcher que des brouillages préjudiciables soient causés à d'autres services.

---

(1) Remplace la Résolution Nº Spa2-4 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

AG

RÉSOLUTION Nº 63

Relative à la protection des services de radiocommunication contre les brouillages causés par le rayonnement des appareils industriels, scientifiques et médicaux (ISM)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les appareils ISM engendrent et utilisent localement de l'énergie radioélectrique et que l'on ne peut pas toujours éviter qu'une partie de cette énergie soit rayonnée à l'extérieur;
b) Qu'il existe un nombre croissant d'appareils ISM, qui fonctionnent sur diverses fréquences réparties dans tout le spectre;
c) Que, dans certains cas, une importante fraction de l'énergie peut être rayonnée par um appareil ISM en dehors de sa fréquence de travail;
d) Que certains services radioélectriques, notamment ceux qui utilisent de faibles niveaux de champ, risquent de subir des brouillages causés par le rayonnement d'appareils ISM et que ces risques sont inacceptables particulièrement lorsqu'il s'agit de services de radionavigation ou d'autres services de sécurité:
e) Que, pour limiter les risques de brouillage à des parties déterminées du spectre:
i) Les précédentes Conférences des radiocommunications (Atlantic City, 1947: Génève, 1959) ont désigné quelques bandes de fréquences à l'intérieur desquelles les services de radiocommunication doivent accepter les brouillages préjudiciables produits par les appareils ISM;
ii) La présente Conférence n'a accepté d'augmenter le nombre des bandes de fréquences utilisables par les appareils ISM qu'à la condition que soient définies les limites du rayonnement de ces appareils à l'intérieur des bandes nouvellement désignées pour une utilisation mondiale et à l'extérieur de l'ensemble des bandes utilisables par les appareils ISM;

décide

que, pour assurer une protection convenable aux services de radiocommunication, il est nécessaire de mener d'urgence des études en vue de définir les limites à imposer aux rayonnements des appareils ISM dans tout le spectre radioélectrique, et plus particulièrement dans les bandes nouvellement désignées.

invite le CCIR

1. À poursuivre, en collaboration avec le CISPR et la CEI, les études qu'il a entreprises au sujet du rayonnement des appareils ISM dans l'ensemble du spectre radioélectrique en vue d'assurer une protection convenable aux services de radiocommunication;

2. À spécifier aussi rapidement que possible dans des Avis les limites à imposer au rayonnement des appareils ISM à l'intérieur et a l'extérieur des bandes qui leur sont désignées dans le Règlement des radiocommunications.

La priorité devrait être donnée aux études permettant de parvenir à un Avis relatif aux bandes de fréquences nouvellement désignées par la présente Conférence pour les appareils ISM et qui sont les suivantes:

6765-6795 kHz;
433,05-434,79 MHz;
61-61,5 GHz;
122-123 GHz;
244-246 GHz;

invite la prochaine conférence administrative des radiocommunications compétente

à résoudre le problème des brouillages causés par les appareils ISM aux services de radiocommunication en tenant compte des Avis du CCIR.

CF

RÉSOLUTION Nº 64

Relative à l'étude par le CCIR de la protection des équipements radioélectriques contre la foudre

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il existe dans le monde des zones où, malgré l'installation de dispositifs de protection contre la foudre, les équipements sont constantemment endommagés et souvent de façon très grave, à la suite des décharges qui se produisent lors d'orages électriques ou de violents orages;
b) Qu'en raison des circonstances, des conditions climatiques, de la pollution de l'environnement par l'homme, etc., les études menées n'ont pas aboiti à des résultats probants;
c) Le manque de moyens matériels et d'expérience des techniciens confrontés à ce phénomène;

considérant en outre

le numéro **72** de la Convention internationale des télécommunications (Malaga-Torremolinos, 1973);

invite le CCIR

1. À étudier ce phénomène en consultation avec le CCITT et à émettre un Avis sur ce sujet;
2. À inclure dans la mesure du possible dans l'étude de ce phénomène, afin de faciliter l'application des techniques de protection, des statistiques sur les décharges de foudre en fonction des zones climatiques dans lesquelles elles se manifestent, sur la fréquence de ces manifestations et les grandeurs caractéristiques de la foudre mesurées sous forme de tensions ou de courants induits, ainsi que les constantes de temps associées:

et invite les administrations

à soumettre au CCIR les données techniques et les résultats des études effectuées dans ce domaine.

AH RÉSOLUTION Nº 65

Relative à la diffusion d'informations actualisées sur les Avis du CCIR mentionnés dans le Règlement des radiocommunications

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

notant

a) Que le Règlement des radiocommunications se réfère à des Avis déterminés du CCIR ainsi qu'à des «Avis pertinents du CCIR»;
b) Que la Résolution 703 prévoit des consultations quant à l'applicabilité des Avis du CCIR relatifs aux critères techniques de partage des bandes de fréquence entre services de radiocommunication spatiale et services de radiocommunications de Terre ou entre services de radiocommunication spatiale;
c) Que les Avis du CCIR peuvent être révisés par les Assemblées plénières du CCIR, ce qui entraine un changement des numéros de référence;

considérant

a) Que pour bien appliquer le Règlement des radiocommunications, les administrations doivent savoir quels Avis du CCIR doivent être pris en considération;
b) Que les renseignements sur la mise à jour de ces Avis sont de la plus haute importance;

invite le CCIR

1. À identifier et énumérer les dispositions du Règlement des radiocommunications contenant une référence à un Avis déterminé du CCIR ou à un «Avis pertinent du CCIR» en indiquant les numéros de référence et les titres de ces Avis;
2. À charger le Directeur du CCIR de fournir au Secrétaire général les renseignements nécessaires à la mise à jour de cette liste;

prie le Secrétaire général

de communiquer à toutes les administrations la liste de ces Avis ainsi que toute mise à jour ultérieure.

AE RÉSOLUTION Nº 66

Relative à la division du monde en Régions aux fins d'attribution des bandes de fréquences

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a)Que la division actuelle du monde en Régions 1, 2 et 3 aux fins de l'attribution des bandes de fréquences remonte à 1947 et que les bases techniques sur lesquelles elle repose n'étaient pas alors clairement définies;
b) Que depuis 1947, les techniques des radiocommunications ont fait des progrès considérables et qu'un grand nombre de pays nouveaux ont fait leur apparition;

consciente

que la division du monde en trois Régions, telle qu'elle existe, ne répond peut-être pas d'une manière appropriée et équitable aux besoins de tous les pays;

reconnaissant

qu'il n'est pas possible de mener à bien la révision nécessaire de la division existante du monde en Régions pendant la présente Conférence;

décide

que cette division doit être revue compte des progrès les plus importants survenus dans la technique des radiocommunications et de l'augmentation du nombre des Membres de l'Union qui sont à des stades différents de développement;

demande au CCIR

d'entreprendre une étude des bases techniques et opérationnelles d'une éventuelle révision de la division du monde aux fins de l'attribution des bandes de fréquences radioélectriques, fondée sur tous les facteurs pertinents tels que la propagation des ondes radioélectriques, les conditions climatiques, la configuration géographique naturelle du monde, le niveau de développement économique et technique, et qui permettra une utilisation plus efficace du spectre des fréquences par tous les pays Membres de l'Union;

prie instamment tous les Membres de l'Union

de participer activement à l'étude susmentionnée, en contribuant aux travaux envisagés;

demande en outre au CCIR

d'achever cette étude et d'en soumettre les résultats au plus tard à sa XVI[e] Assemblée plénière et, en tout cas, d'établir un rapport qui sera examiné par la prochaine Assemblée plénière;

invite le Conseil d'administration

à suivre le déroulement de cette étude et à donner des avis à la Conférence de plénipotentiaires afin que la question puisse être résolue comme il convient lors dLune future conférence administrative mondiale des radiocommunications de l'Union.

BJ RÉSOLUTION N° 67

Relative au perfectionnement de la conception et de l'utilisation des matériels radioélectriques

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le spectre des fréquences radioélectriques est une ressource naturelle limitée qui n'a d'intérêt que si elle est exploitée;
b) Que l'utilisation efficace du spectre peut être compromise par les caractéristiques des matériels d'émission et de réception:
c) Que les conditions de fonctionnement des systèmes radioélectriques peuvent aussi porter préjudice à l'utilisation efficace du spectre;
d) Que les progrès constants de l'électronique et des branches connexes permettent de produire des systèmes de radiocommunication qui utilisent plus rationnellement le spectre des fréquences;

décide

que les administrations devraient encourager le perfectionnement de la conception et de la construction des matériels radioélectriques, ainsi que du mode d'exploitation des systèmes, afin d'utiliser au mieux le spectre des fréquences radioélectriques.

CD RÉSOLUTION N° 68

Relative à la nouvellde définition de certains termes contenus dans l'Annexe 2 à la Convention internationale des télécommunications (Málaga-Torremolinos, 1973) et applicables au Règlement des radiocommunications

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

ayant examiné et adopté

les termes et définitions contenus dans l'article 1 du Règlement des radiocommunications (Génève, 1979), qui comprend un certain nombre de termes déjà définis dans l'Annexe 2 à la Convention internationale des télécommunications (Malaga-Torremolinos, 1973) intitulée «Définition de certains termes employés dans la Convention et dans les Règlements de l'Union internationale des télécommunications»;

estimant

que les définitions de certains termes, comme «brouillage nuisible» (dans le présent Règlement «brouillage préjudiciable»), «télégraphie» et «téléphonie», ainsi que des termes associés qui figurent également dans l'annexe 2 à la Convention et qui revêtent une certaine importance pour le Règlement des radiocommunications, devraient être revues afin de les rendre plus précises et plus conformes aux techniques actuelles;

reconnaissant toutefois

que, compte tenu de l'article 51 et notamment du numéro **167** de la Convention internationale des télécommunications (Malaga-Torremolinos, 1973), seule une Conférence de Plénipotentiaires de l'Union internationale des télécommunications est habilitée à modifier les termes contenus dans l'Annexe 2 à ladite Convention ainsi que leurs définitions;

recommande

à la Conférence de plénipotentiaires de l'Union internationale des télécommunications (Nairobi, 1982) de réexaminer la définition, dans l'Annexe 2 à la Convention internationale des télécommunications, des termes «brouillage nuisible», «télégraphie» et «téléphonie» et des termes associés en tenant compte des termes et définitions adoptés pour l'usage du Règlement des radiocommunications par la Conférence administrative mondiale des radiocommunications (Génève, 1979), ainsi que des propositions éventuellement soumises par le CCIR et le CCITT en application de la Résolution N° 44 de la Conférence de plénipotentiaires (Malaga-Torremolinos, 1973);

charge le Secrétaire général

1. De porter cette question à l'attention de ladite Conférence de plénipotentaires;
2. D'indiquer par des notes, dans la version publiée au Règlement des radiocommunications, les définitions qui ne sont pas alignées sur l'Annexe 2 à la Convention, en soulignant le fait que les définitions correspondantes qui figurent dans cette annexe prévaudront sur celles qui figurent dans le Règlement des radiocommunications, dans la mesure où elles présentent des différences;
3. De modifier ou de supprimer ces notes pour tenir compte des décisions pertinentes de la Conference de plénipotentiaires.

BD RÉSOLUTION N° 100

Relative à la coordination, la notification et l'inscription, dans le Fichier de référence international des fréquences, des assignations à des stations du service fixe par satellite, à l'égard des stations du service de radiodiffusion par satellite dans la Région 2 (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

que le Règlement des radiocommunications ne contient aucune dispositions traitant de la coordination de la notification et de l'inscription dans le Fichier de référence international des fréquences des assignations de fréquence aux stations du service fixe par satellite dans la bande 12,1-12,3 GHz en ce qui concerne leur interaction avec les stations du service de radiodiffusion par satellite dans la Région 2;

décide

que les dispositions des articles 11 et 13 du Règlement des radiocommunications seront appliquées dans ces cas jusqu'à ce que cette question puisse être examinée par une conférence administrative des radiocommunications compétente.

BQ RÉSOLUTION N° 101

Relative à la conclusion d'accords et à l'établissement des plans associés pour des liaisons de connexion aux stations spatiales du service de radiodiffusion par satellite fonctionnant dans la bande des 12 GHz, conformément au Plan adopté par la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) pour les Régions 1 et 3.

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il convient d'utiliser le plus efficacement possible l'orbite des satellites géostationnaires et les bandes de fréquences attribuées au service fixe par satellite;

---

(1) Remplace la Résolution N° Spa-6 de la Conférence administrative mondiale pour la radiocommunications pour la radiodiffusion par satellite (Génève, 1971).

b) Que la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) a élaboré et adopté des dispositions et un Plan associé d'attribution de canaux et de positions orbitales dans les bandes fréquences 11,7-12,5 GHz pour la Région 1 et 11,7-12,2 GHz pour la Région 3, qui figurent dans l'appendice 30;

c) Que les liaisons de connexion aux satellites de radiodiffusion font partie du service fixe par satellite et que l'utilisation des bandes de fréquences sur ces liaisons est actuellement régie par les dispositions des articles 11 et 13 du Règlement des radiocommunications;

d) Que la présence de nombreux satellites de radiodiffusion fonctionnant dans des positions de l'orbite des satellites géostationnaires par les plans précités entraînera de grandes difficultés pour la coordination, avec les systèmes du service par satellite, de l'utilisation des bandes de fréquences sur les liaisons de connexion pour la transmission de programmes;

e) Que les critères de partage existant dans l'article 27 nont pas été établis spécifiquement pour les liaisons de connexion pour le service de radiodiffusion par satellite dans les bandes où l'utilisation du service fixe par satellite est réservée exclusivement aux liaisons de connexion pour le service de radiodiffusion par satellite;

notant

a) Que la présente Conférence a reconnu certaines bandes de fréquences comme disponibles pour les liaisons de connexion aux satellites de radiodiffusion (voir le Tableau des attributions de bandes de fréquences et les renvois associés, numéros **835**, **858**, **863** et **869**);

b) Que le choix de bandes de fréquences pour les liaisions de connexion aux satellites de radiodiffusion doit être laissé aux administrations concernées;

décide

1. Que les liaisons de connexion aux satellites de radiodiffusion fonctionnant dans les bandes 11,7-12,5 GHz dans la Région 1 et 11,7-12,2 GHz dans la Région 3 doivent être organisées et exploitées, dans les bandes 10,7-11,7 GHz, 14,5-14,8 GHz (uniquement pour les pays situés en dehors de l'Europe et pour Malte) et 17,3-18,1 GHz pour la Région 1 et 14,5-14,8 GHz et 17,3-18,1 GHz pour la Région 3, conformément aux accords et aux plans associés, adoptés par une conférence administrative des radiocommunications à laquelle pourront participer toutes les administrations intéressées ainsi que les administrations dont les services pourraient être affectés; toutefois, les administrations peuvent également utiliser les liaisons de connexion aux satellites de radiodiffusion dans la bande 14,0-14,5 GHz (uniquement pour les pays situés en dehors de l'Europe et pour Malte) ou dans d'autres bandes de fréquences attribuées au service fixe par satellite (Terre vers espace), sous réserve d'une coordination avec d'autres réseaux du service fixe par satéllite;

2. Que jusqu'à l'entrée en vigueur des accords et des plans associés précités, les administrations et l'IFRB doivent appliquer les procédures décrites dans les articles 11 et 13 et dans la Résolution **102** pour les liaisons de connexion aux satellites de radiodiffusion fontionnant dans les bandes mentionées au paragraphe 1 de la partie *décide* du dispositif.

3. Que, jusqu'à l'entrée en vigueur des actes finals de la conférence administrative des radiocommunications proposée, les critères spécifiés dans l'article 27 pour le partage entre les services de Terre et le service fixe par satellite seront aussi applicables aux liaisons de connexion du service de radiodiffusion par satellite dans les bandes susmentionnées;

invite le Conseil d'administration

à étudier la question de la convocation d'une conférence administrative des radiocommunications afin de fixer la date et le lieu réunion appropriés de cette conférence, ainsi que son ordre du jour;

invite le CCIR

1. À étudier les caractéristiques techniques les plus appropriées pour les liaisons de connexion aux satellites de radiodiffusion ainsi que les méthodes de planification pour l'attribution des canaux à ces liaisions dans les bandes attribuées par la Conférence administrative mondiale des radiocommunications (Génève, 1979) (voir la Recommandation **101**);

2. À étudier et à déterminer d'urgence les critères de partage appropriés à appliquer entre les services fixe et mobile et les liaisons de connexion aux satellites de radiodiffusion.

CS RÉSOLUTION N° 102

Relative à la coordination entre administrations des caractéristiques techniques des liaisons de connexion aux stations spatiales du service de radiodiffusion par satellite de la bande 11,7-12,5 GHz (Région 1) et 11,7-12,2 GHz (Région 3) pour la période comprise entre l'entrée en vigueur des Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979) et l'entrée en vigueur des actes finals de la future conférence de planification des liaisons de connexion à de telles stations spatiales.

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que, avant la convocation d'une conférence de planification des liaisons de connexion, toute administration désirant utiliser une liaison de connexion à une station spatiale du service de radiodiffusion par satellite devrait pouvoir déterminer les caractéristiques techniques de cette liaison en accord avec toutes les administrations partageant la même position orbitale pour de telles stations prévues au Plan contenu dans les Actes finals de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) (appendice 30), en tenant compte des Avis pertinents du CCIR;

b) Que toute administration désirant mettre en service une station spatiale du service de radiodiffusion par satellite conformément aux dispositions de l'appendice 30 et utiliser à cet effet une assignation de fréquence pour la liaison de connexion devra appliquer les procédures de publication anticipée et de coordination prévue dans l'article 11 pour cette liaison de connexion;

décide

1. Que l'IFRB, lorsqui'il procédera à la publication anticipée aux termes du numéro **1044** devra aussi indiquer les administrations au nom desquelles une assignation de fréquence est inscrite dans l'appendice 30 pour la même position orbitale;

2. Que l'accord ou les commentaires des administrations mentionnées au paragraphe 1 ci-dessus seront communiqués à l'administration qui recherche la coordination dans um dálai de quatre mois à compter de la date de la publication anticipée;

3. Qu'un accord de pré-coordination entre les administrations partageant la même position orbitale dans le Plan pourra être effectué, si nécessaire avec l'assistance du Comité, au cours d'une réunion à laquelle ces administrations seront invitées et pourront participer si elles le désirent;

4. Que le résultat de cet accord de pré-coordination sera publié en complément des procédures normales de coordination effectuées conformément aux dispositions de l'article 11 et que la conférence qui sera chargée de la planification des liaisons de connexion sera informée de tous les accords de pré-coordination effectués en application de la présent Résolution, sans préjuger d'aucune façon des décisions que prendra cette conférence.

BZ RÉSOLUTION N° 103

Relative à l'amélioration de l'assistance aux pays en développement en vue de faciliter l'accès de leur service fixe aux bandes des ondes décamétriques et d'assurer la protection de leurs assignations contre les brouillages préjudiciables

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

prenant note

d'autres résolutions adoptées par la présente Conférence concernant les besoins particuliers des pays en développement;

considérent

a) Que, dans de nombreux cas, les pays en développement ont besoin d'une assistance de nature hautement spécialisée, qui soivent être obtenue à bref délai, notamment en ce qui concerne le service fixe et l'utilisation de bandes de fréquences dans la gamme des ondes décamétriques;

b) Que les connaissances techniques et l'expérience qui présentent à cet égard le plus d'intérêt pour ces pays peuvent leur être fournies par le Comité international d'enregistrement des fréquences ou par son intermédiaire;

considérant en outre

c) Que les ressources de l'IFRB sont limitées;

décide

1. Que les dispositions des numéros **1218, 1260, 1275 à 1304, 1416** et **1963 à 1966** du Règlement des radiocommunications sont essentiellement destinées à être utilisées par les administrations des pays en développement;

2. Que les administrations des pays développés devraient recourir le moins possible à de telles dispositions;

3. Que les administrations des pays en développement devraient recourir le plus possible à de telles dispositions.

AN

RÉSOLUTION N° 200 (1)

Relative à l'utilisation des classes d'émission R3E et J3E aux fins de détresse et de sécurité sur la fréquence porteuse 2182 kHz (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

notant

a) Que le Règlement des radiocommunications prévoit l'utilisation, sur la fréquence porteuse 2182 kHz:

De la classe d'émission A3E ou H3E par les stations de navire, d'aéronef et d'engin de sauvetage;
De la classe d'émission H3E par les stations côtières;
Des classes d'émissions spécifiées dans l'appendice 37 par les radiobalises de localisation des sinistres;

b) Que ces dispositions ont pour object principal d'assurer la fiabilité des communications de détresse et de sécurité par l'emploi de techniques éprouvées;

prenent note également

a) Du Rapport final du Groupe d'experts (Génève, 1963);
b) Des études pertinents du CCIR concernant la technique de la bande latérale unique (voir la Question 26-1/8, les Avis 488, 543 et 544 et le Rapport 744 du CCIR);

reconnaissant

que l'emploi des classes d'émission R3E et J3E donnerait à l'exploitation sur la fréquence porteuse 2182 kHz les avantages inhérents à l'emploi de la technique de la bande latérale unique sont on bénéficie déjà sur d'autres fréquences;

reconnaissant toutefois

que le CCIR recommande que la classe d'émission R3E ne soit pas utilisée aux fins de détresse et de sécurité (voir l'Avis 543 du CCIR);

considérant

a) Qu'un grand nombre d'appareils utilisant les classes d'émission A3E et H3E seront encore en usage pour la détresse et la sécurité le 1er janvier 1982;
b) Que le matériel à bande latérale unique doit être conçu pour fonctionner avec des tolérances de fréquence plus strictes et selon des normes techniques plus élévées que le matériel à double bande latérale;
c) Que le matériel conçu pour la sécurité, en particulier le matériel des engins de sauvetage, doit:

Avoir un fonctionnement sûr dans des conditions extérieures variables et après de longues périodes de stockage;
Être en toute circonstance d'un emploi facile par une personne inexpérimentée;
Être d'un prix relativement modique;

d) Que les besoins de radiogoniométrie et de ralliement doivent être satisfaits;
e) Que la nécessité d'émettre et de recevoir les signaux d'alarme radiotéléphonique à deux fréquences, notamment les signaux des radiobalises de localisation des sinistres, doit aussi être satisfaite ou qu'il doit être tenu compte à cet égard des tolérances de fréquence indiquées à l'appendice 37 et des Avis pertinents du CCIR;

décide

1. Que l'emploi des classes d'émission R3E et J3E pour la détresse et la sécurité doit continuer à être étudié;
2. Qu'il convient que cette étude soit achevée en temps voulu pour que la prochaine conférence administrative mondiale des radiocommunications compétente puisse prendre une décision sur la date de passage définitif aux classes d'émission R3E et J3E sur la fréquence porteuse 2182 kHz;

demande au CCIR

de continuer à étudier cette question comme un sujet urgent et d'émettre si possible des Avis assez tôt avant la conférence précitée;

---

(1) Note du secrétariat général: voir aussi la Résolution 305.
(2) Remplace la Résolution N° Mar2-20 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

demande au Secrétaire général

de communiquer la présente Résolution à l'Organisation intergouvernementale consultive de la navigation maritime;

invite l'Organisation intergouvernementale consultative de la navigation maritime

à inclure l'éxamen de ce sujet dans le cadre de l'étude actuellement entreprise sur le système de détresse et de sécurité maritime.

AB

RÉSOLUTION N° 201

Relative aux dispositions d'exploitation à la taxation et à la comptabilité de la correspondance publique dans les services mobiles

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le CCITT, conformément aux décisions de la Conférence administrative mondiale des radiocommunications maritime (Génève, 1974) a préparé deux Avis relatifs à l'exploitation dans le service mobile maritime et à la taxation, la comptabilité et le remboursement dans le service mobile maritime;

b) Que la présente Conférence a accepté, dans leur ensemble et dans la plupart des points de détail, les conclusions du rapport sur les études effectuées par le CCITT, conformément aux résolutions pertinentes de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974), qui sont dès lors abrogées;

c) Qu'en conséquence, le Règlement additionnel des radiocommunications ainsi que certaines dispositions du Règlement des radiocommunications relatives à l'exploitation, à la taxation et à la comptabilité de la correspondance publique dans les services mobiles ont été remplacés par des dispositions rendant applicables d'une façon générale les Avis du CCITT;

d) Qu'un certain nombre des dispositions qui ont été remplacées se rapportaient à des services mobiles autres que le service mobile maritime et le service mobile maritime par satellite;

e) Que les dispositions contenues dans le deux Avis susmentionnés du CCITT relatif à la correspondance publique ne s'appliquent actuellement qu'au service mobile maritime et au service mobile maritime par satellite;

f) Qu'en outre, dans toute révision des Avis pertinents du CCITT, il y a lieu de prendre pleinement en considération les intérêts maritimes, en laissant aux administrations un temps suffisant pour leur permettre de mener les consultations relatives à ces intérêts;

reconnaissant

a) Qu'il n'y a pas actuellement de dispositions particulières prévues pour la correspondance publique internationale dans les services mobiles autres que le service mobile maritime et le service mobile maritime par satellite;

b) Que la correspondance publique internationale pourrait cependent s'étendre dans l'avenir à des services mobiles autre que le service mobile maritime et le service mobile maritime par satellite;

invite le CCITT

à entreprendre, en cas de besoin, l'étude des dispositions relatives aux dispositions d'exploitation, de taxation et de comptabilité concernant la correspondance publique dans les services mobiles autres que le service mobile maritime et le service mobile maritime par satellite, en visant à harmoniser le plus possible toutes les dispositions concernant les services mobiles en question;

invite en outre le CCITT

en poursuivant ses travaux relatifs au service mobile maritime et au service mobile maritime par satellite, à prendre particulièrement en considération les intérêts maritimes;

décidé

que, dans l'éventualité où un service de correspondance publique internationale serait ouvert dans un service mobile autre que le service mobile maritime et le service mobile maritime par satellite, ce nouveau service devrait se conformer autant que pratiquement possible aux dispositions actuelles d'exploitation, de taxation et de comptabilité prévues par le Règlement des radiocommunications, le Règlement téléphonique et le Règlement télégraphique ainsi que par le Avis pertinents du CCITT, jusqu'à ce que les révisions nécessaires puissant être effectuées.

DH

RÉSOLUTION N° 202

Relative à la convocation d'une conférence administrative mondiale des radiocommunications pour les services mobiles

La Conférence administrative mondiale des radiocommunicatons (Génève, 1979),

notant

la Résolution N° **814** du Conseil d'administration;

considérant

a) Que l'ordre du jour de la présente Conférence prévoit une révision partielle du Règlement des radiocommunications et que la révision complète nécessaiterait la convocation d'une conférence appropriée pour réviser la teneur des articles restants, en particulier ceux qui concernant les services mobiles;
b) Que, compte tenu des décisions qu'elle a prises et de la nécessité d'harmoniser certaines dispositions applicables aux services mobiles aéronautiques, maritime et terrestre, et en particulier d'améliorer les dispositions relatives à la détresse et à la sécurité, et qu'en raison des progrès techniques et de l'introduction de nouveaux systèmes, il est nécessaire de réviser un certain nombre de dispositions concernant les services mobiles;
c) Qu'il faut tenir compte des nouvelles demandes auxquelles doivent faire face les services mobiles;
d) Que la présente Conférence a formulé diverses recommendations envisageant la convocation d'une conférence qui traiterait des dispositions applicables aux services mobiles;
e) Que, lorsque des modifications aux bandes de fréquences attribuées aux services mobiles ont été introduites par la présente Conférence il peut être nécessaire d'apporter des modifications aux plans des voies et autres subdivisions de ces bandes de fréquences pour les services intéressés;

notant, en outre

que les Actes finals de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) prévoient un Plan d'allotissement pour ce service, que ce Plan est à l'heure actuelle en cours d'application, et qu'il ne devrait pas être modifié dans un proche avenir;

décide d'inviter le Conseil d'administration

à prendre les dispositions nécessaires en vue de la convocation d'une conférence administrative mondiale des radiocommunications pour les services mobiles, afin de réviser les dispositions du Règlement des radiocommunications qui concernent plus particulièrement ces services;

invite

1. Le CCIR à préparer les bases techniques et d'exploitation pour la conférence;
2. L'IFRB à prêter son aide technique pour la préparation et l'organisation de la conférence.

AZ

RÉSOLUTION N° 300

Relative à l'utilisation et á la notification des fréquences appariées réservées aus systèmes à bande étroite de télégraphie à impression directe et de transmission de données fonctionnant dans les bandes d'ondes décamétriques attribuées au service mobile maritime (1).

(Voir l'appendice 32)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que certaines parties des bandes d'ondes décamétriques atrribuées au service mobile maritime ont été réservées aux systèmes à bande étroite de télégraphie à impression directe et de transmission de données, à la condition qu'ils utilisent exclusivement des fréquences appariées;
b) Que, dans chaque bande, le nombre des fréquences appariées est limité;
c) Qu'une future conférence ayant compétence à cet effet pourrait attribuer aux systèmes à bande étroite de télégraphie à impression directe des bandes plus larges que les bandes actuelles;

(1) Remplace la Résolution N° Mar2-7 de la Conférence adnuinistrative mondiale des radiocommunications maritimes (Génève, 1974).

d) Que, pour cette raison, la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974) n'a pas estimé opportun, lors de sa réunion, d'établir un plan, mais que ce plan pourrait devenir nécessaire ultérieurement par suite de l'encombrement des voies;

e) Que, cependant, des mesures intérimaires doivent être prises par les administrations et par l'IFRB pour assurer la mise en service ordonnée de ces nouvelles fréquences appariées;

décide

1. Que les fréquences appariées des bandes d'ondes décamétriques réservées aux systèmes à bande étroite de télégraphie à impression directe entre stations côtières et stations de navire seront utilisées par ces stations, notifiées et inscrites dans le Fichier de référence international des fréquences selon des modalités suivantes:

1.1. Les assignations de paires de fréquences pour l'émission et la réception seront faites uniquement aux stations côtières. Les stations de navire de toute nationalité utiliseront de plein droit pour leurs émissions les fréquences de réception des stations côtières avec lesquelles elles échangeront du trafic;

1.2. Afin d'obtenir une utilisation efficace des fréquences, chaque administration choisira les paires de fréquences à assigner aux stations côtières selon ses besoins avec l'aide de l'IFRB;

1.3. Les assignations ainsi choisies et mises en service seront notifiées à l'IRFB sur des fiches dont le modèle figure dans l'appendice 1 au Règlement des radiocommunications, et les administrations fourniront les caractèristiques fondamentales énumérées aux stations A ou B, selon les cas, dudit appendice. Se ces assignations sont conformes au Tableau d'attribution des bandes de fréquences et aux dispositions connexes du Règlement des radiocommunications ainsi qu'à la présente Résolution, le Comité, à titre d'information, les publiera dans la partie 1A de sa circulaire hebdomadaire et les inscrira dans le Fichier de référence. Il n'inscrira aucune date dans la colonne 2 du Fichier de référence et ne formulera aucune conclusion découlant d'un examen technique de compatibilité avec une assignation existante. Toutefois, la date à laquelle le Comité aura reçu la fiche de notification sera indiquée dans la partie 1A de la circulaire hebdomadaire et dans la colonne Observations du Fichier de référence. Une référence à la présente Résolution sera aussi inscrite dans la colonne Observations;

1.4. Toute fiche de notification qui ne serait pas conforme aux dispositions précitées du Règlement des radiocommunications ou à la présente Résolution sera retournée par l'IFRB à l'administration notificatrice accompagnée de toute suggestion que le Comité pourrait présenter à cet égard.

1.5. Si des difficultés surgissent entre les pays utilisant une même voie, la question sera résolue par arrangement mutuel entre les administrations intéressées;

2. Qu'une future conférence ayant compétence à cet effet sera invitée à examiner les difficultés qu'aurait pu soulever l'application de la présente Résolution et à prendre, si nécessaire, une décision sur le statut à donner aux assignations susmentionées ou sur les conditions d'établissement d'un plan pour les bandes et les systèmes en question. Les inscriptions faites dans le Fichier de référence en application de la présente Résolution ne préjugeront en aucune façon les décisions qui pourraient être prises par la conférence susmentionnée;

3. Que la présente Résolution s'applique aux assignations de fréquence appariées aux systèmes à bande étroite de télégraphie à impression directe comme indiqué au paragraphe 1.1 ci-dessus, nonobstant toutes autres dispositions contraires du Règlement des radiocommunications et des résolutions existantes des conférences administratives des radiocommunications.

BA RÉSOLUTION Nº 301

Relative à la notification des fréquences non appariées utilisées par les stations de navire pour les systèmes à bande étroite de télégraphie à impression directe et de transmission de données (1)

(Voir l'appendice 33)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que certaines parties des bandes d'ondes décamétriques attribuées au service mobile maritime sont réservées aux systèmes à bande étroite de télégraphie à impression directe et de transmission de données qui utilisent des fréquences non appariées;

b) Que la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974) n'a pas été en mesure de décider jusqu'à quel point il faut réglementer l'utilisation rationnelle des fréquences pour la transmission par les stations de navire de signaux de télégraphie à impression directe émis sur des fréquences non appariées, ni de décider sur quelle bande il conviendrait de fonder cette réglementation;

c) Qu'il convient que des questions soient examinées par une future conférence compétente en la matière;

(1) Remplace la Résolution Nº Mar2-8 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

d) Que les dispositions actuelles du Règlement des radiocommunications ne donnent pas aux administrations les directives voulues pour la période comprise entre la date d'entrée en vigueur des Actes finals de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974) et la date d'entrée en vigueur de ceux de la conférence visée au paragraphe *c*) ci-dessus;

décide

1. Que, pendant la période dont il esta question à l'alinéa *d*) ci-dessus, toute administration qui exploitera ou mettra en fonctionnement, à l'intention des navires, un système à bande étroite de télégraphie à impression directe ou de transmission de données utilisant des fréquences non appariées, devra notifier à l'IFRB, aux fins d'inscription dans le Fichier de référence international des fréquences, les fréquences sur lesquelles devront émettre les navires qui participeront à ce service;

2. Que les fiches de nitification relatives aux fréquences utilisées à la réception par les stations côtières ne feront pas l'objet d'un examen technique de la part l'IFRB et que les assignations notifiées seront inscrites dans le Fichier de référence uniquement à titre d'information, sans date dans la colonne 2, mais avec dans la colonne Observations, une observation pertinente contenant simplement une référence à la présente Résolution;

3. Que ces inscriptions dans le Fichier de référence ne préjugeront en aucune façon les décisions que pourra prendre la conférence visée au paragraphe *c*) ci-dessus.

AX RÉSOLUTION Nº 302

Relative au traitement par l'IFRB des fiches de notification d'assignation de fréquence aux stations océanographiques (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'elle a adopté la Resolution **314** relative à l'établissement d'une système mondial coordonné de rassemblement des données concernant l'océanographie;

b) Que l'IFRB a besoin d'instructions concernant la notification des assignations de fréquence aux stations océanographiques et leur inscription dans le Fichier de référence international des fréquences;

décide

de donner pour instructions à l'IFRB de n'accepter aux fins d'inscription dans de Fichier de référence international des fréquences que les fiches de notification présentées par des administration aux termes des numéros **1214** à **1217** et **1219** du Règlement des radiocommunications, qui concernent des stations océanographiques d'émission et de réception qui sont situées à terre et qui sont conformes aux dispositions de la Résolution **314**. L'IFRB traitera ces fiches de ntofication selon les dispositions du numéro 1245 du Règlement des radiocommunications. Les inscriptions pertinentes dans le Fichier de référence ne préjugeront en aucune façon les décisions que prendra la prochaine conférence administrative des radiocommunications compétente en ce qui concerne le service mobile maritime.

AV RÉSOLUTION Nº 303

Relative aux fréquences navire-navire dans les bandes comprises entre 1605 kHz et 3600 kHz dans la Région 1 (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le Fichier de référence international des fréquences comprend parmi ses inscriptions initiales les fréquences qui ont été assignées par la Conférence administrative extraordinaire des radiocommunications (Génève, 1951), à des pays déterminés pour des communications entre navires dans les bandes comprises entre 1605 kHz et 3600 kHz dans la Région 1;

b) Qu'il convient de prendre des dispositions pour la notification et l'inscription dans le Fichier de référence de l'utilisation de ces fréquences pour des communications entre navires par les administrations d'autres pays de la Région 1;

---

(1) Remplace la Résolution Nº Mar19 de la Conférence administrative mondiale des radiocommunications (Génève, 1967).

(2) Remplace la Résolution Nº 15 de la Conférence administrative des radiocommunications (Génève, 1959).

décide

1. Qu'il convient que l'utilisation des fréquences dont il est question au paragraphe *a*) par d'autres administrations soit coordonnée par les administrations intéressées et notifiée par la suite au Comité international d'enregistrement des fréquences;

2. Que lorsqu'il recevra semblable notification, le Comité inscrira ce nouvelles assignations dans le Fichier de référence international des fréquences sans date dans la colonne 2a ni dans la colonne 2b, mais avec une observation pertinente dans la colonne Observations, suivie de la date de réception par le Comité de la fiche de notification;

invite les administrations

à réexaminer les zones d'utilisation des assignations de fréquence intéressés, telles qu'elles sont inscrites dans le Fichier de référence, en vue d'améliorer les possibilités de partage;

prie l'IFRB

de présenter, s'il y a lieu, aux administrations intéressés les propositions qu'il peut être en mesure de formuler en vue d'atteindre le but dont il est question au paragraphe qui précède.

AS RÉSOLUTION Nº 304

Relative à la mise en œuvre de la nouvelle disposition des voies utilisées pour la télégraphie Morse de classe A1A dans les bandes attribuées au service mobile maritime entre 4000 kHz et 27 500 kHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que dans sa Recommandation Nº Mar7, la Conférence administrative mondiale des radiocommunications (Génève, 1967) a recommandé aux administration d'étudier les questions concernant, l'utilisation future de la relation harmonique dans les appareils radioélectriques de navire;

b) Que la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974) a pris des mesures pour que les stations de navire puissent utiliser, pour la télégraphie Morse de classe A1A, des fréquences d'appel et des fréquences de travail qui ne sont pas en relation harmonique;

c) Qu'il est souhaitable de mettre en œuvre, dès que possible, la nouvelle disposition des voies;

reconnaissant

a) Qu'il est nécessaire de prévoir un délai d'amortissement pour les appareils radioélectriques dont le fonctionnement dépend de la relation harmonique des fréquences de travail;

b) Que l'évolution et les progrès de la technique, en particulier celle des synthétiseurs de fréquence, ont permis de disposer d'appareils radioélectriques plus stables et plus fiables;

décide

1. Que les stations de navire dont le fonctionnement dépend de fréquences d'appel et de fréquences de travail en relation harmonique assignée avant le 1er janvier 1976, peuvent continuer à utiliser celles de ces assignations qui se trouvent à l'intérieur des bandes indiquées dans l'appendice 31 pour l'appel et le travail des navires en télégraphie Morse de classe A1A;

2. Qu'il convient que, dès que possible, les navires utilisent des appareils pouvant fonctionner conformément à la nouvelle disposition des voies figurant dans l'appendice 35 en ce qui concerne les fréquences nécessaires à l'execution de leur service;

3. Que les appareils installés après le 1er janvier 1976 doivent pouvoir fonctionner conformément à la nouvelle disposition des voies figurant dans l'appendice 35 en ce qui concerne les fréquences nécessaires à l'execution de leur service.

AO RÉSOLUTION Nº 305 (2)

Relative à l'utilisation des classes d'émission R3E e J3E sur les fréquences porteuses 4125 kHz et 6215,5 kHz utilisées en plus de la fréquence porteuse 2182 kHz aux fins de détresse et de sécurité (3)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

---

(1) Remplace la Résolution Nº Mar2-4 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).
(2) Note du Secrétariat général: voir aussi la Résolution 200.
(3) Remplace la Résolution Nº Mar2-21 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

notant

a) Que le Règlement des radiocommunications autorise jusqu'au 1er janvier 1984 l'utilisation d'émissions de la classe H3E par les stations côtières, les stations de navire et les stations d'aéronef émettant sur les fréquences porteuses 4125 kHz et 6215,5 kHz (voir les numéros **2982** et **2986**);
b) Que ces dispositions ont pour objet principal d'assurer la fiabilité des communications de détresse et de sécurité par l'emploi de techniques éprouvées;

prenant note également

a) Du Rapport final du Groupe d'experts (Génève, 1963);
b) Des études pertinentes du CCIR concernant la téchnique de la bande latérale unique (voir la question 26–1/8 et les Avis 488, 543 et 544 et le Rapport 744 du CCIR);

reconnaisant

que l'emploi des classes d'émission R3E et J3E donnerait à l'exploitation sur les fréquences porteuses 4125 kHz et 6215,5 kHz les avantages inhérents à l'emploi de la technique de la bande latérale unique dont on bénéficie déjà sur d'autres fréquences;

reconnaissant toutefois

que le CCIR recommande que la classe d'émission R3E ne soit pas utilisée aux fins de détresse et de sécurité (voir l'Avis 543 du CCIR);

considérant

a) Qu'un grand nombre d'appareils utilisant la classe d'émission H3E sont encore en usage pour la détresse et la sécurité;
b) Que le matériel utilisant les classes d'émission R3E et J3E doit être conçu pour fonctionner avec des tolérances de fréquence plus strictes et selon des normes techniques plus élevées que le matériel utilisant la classe d'émission H3E avec détection d'envelopee dans le récepteur;
c) Que le matériel conçu pour la sécurité devrait, en toutes circonstances, avoir un fonctionnement sur dans des conditions extérieures variables et être d'un emploi facile par une personne inexpérimentée;

décide

qu'il n'est pas nécessaire de poursuivre l'étude relative à l'emploi des classes d'émission R3E et J3E pour la détresse et la sécurité sur les fréquences porteuses 4125 kHz et 6215,5 kHz (voir les Avis 543 et 544 du CCIR);

demande au Secrétaire général

de communiquer la présente Résolution à l'Organisation intergouvernementale consultative de la navigation maritime;

invite

1. L'Organisation intergouvernamental consultative de la navigation maritime à inclure l'examen de ce sujet dans le cadre de l'étude actuellement entreprise sur le système de détresse et de sécurité maritime;
2. La prochaine conférence administrative mondiale des radiocommunications compétente à poursuivre l'examen de ce sujet.

AW RÉSOLUTION Nº 306

Relative à l'emploi de la technique de la bande latérale unique dans les bandes du service mobile maritime radiotéléphonique comprise entre 1605 kHz et 4000 kHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) La Recommandation Nº 28 de la Conférence administrative des radiocommunications (Génève, 1959);
b) Que la Conférence administrative mondiale des radiocommunications (Génève, 1967) a décidé d'imposer l'utilisation de la technique de la bande latérale unique, sauf dans certaines circonstances;
c) Qu'il est souhaitable de remplacer dès que possible les émissions à double latérale par des émissions à bande latérale unique dans les bandes atribuées au service mobile maritime entre 1605 kHz et 4000 kHz;

(1) Remplace la Résolution Nº Mar5 de la Conférence administrative mondiale des radiocommunications (Génève, 1967).

décide

que, sauf disposition contraire contenue dans les Actes finals de la présente Conférence, les stations radiotéléphoniques du service mobile maritime qui fonctionnent dans les bandes comprises entre 1605 kHz et 4000 kHz devront être conformes aux conditions suivantes:

1. Aucune nouvelle installation d'appareils à double bande latérale ne doit être autorisée dans les stations de navire, à l'exception des cas prévus aux numéros **2973**, **4127** et **4130** du Règlement des radiocommunications;

2. Jusqu'au 1er janvier 1982 les stations côtières et les stations de navire équipées d'appareils à bande latérale unique devront également être équipées de façon à pouvoir faire des émissions de la classe H3E compatibles avec l'emploi de récepteurs à double bande latérale. L'obligation de pouvoir faire des émissions de la classe H3E sur la fréquence porteuse 2182 kHz subsistera au-delà du 1er janvier 1982;

3. Après le 1er janvier 1982, seules les émissions des classes R3E et J3E seront autorisées; cependant, les émissions suivantes seront, de plus, autorisées:

Les émissions des classes A3E et H3E pour les stations de navire, d'aéronef ou d'engin de sauvetage émettant sur la fréquence porteuse 2182 kHz;

Les émission de la classe H3E pour les stations côtières émettant sur la fréquence porteuse 2182 kHz;

Dans les Régions 1 et 3 au Groenland, à titre exceptionnel, les émissions de la classe H3E pour les stations côtières qui diffusent des messages de sécurité sur la fréquence porteuse 2170,5 kHz;

Les émissions des classes H2B, R2B et J2B pour les stations côtières aux fins d'appel sélectif sur la fréquence porteuse 2170,5 kHz;

Les émissions des classes spécificées à l'appendice 37 au Règlement des radiocommunications pour les radiobalises de localisation des sinistres (voir également le numéro **3265** du Règlement des radiocommunications);

4. À partir du 1er janvier 1982, les stations de navire et celles des stations d'aéronef qui sont tenues de mettre en œuvre la technique de la bande latérale unique sur les fréquences de travail du service mobile maritime utiliseront uniquement des émissions de la classe H3E sur la fréquence porteuse 2182 kHz.

AQ

RÉSOLUTION Nº 307

Relative au passage à la technique de la bande latérale unique des stations radiotéléphoniques du service mobile maritime dans les bandes comprises entre 1605 kHz et 4000 kHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les stations radiotéléphoniques à double bande latérale du service mobile maritime qui fonctionnent dans les bandes comprises entre 1605 kHz et 4000 kHz utilisent une largeur de bande de l'ordre de 6 kHz;

b) Que ces stations auront à utiliser à l'avenir la technique de la bande latérale unique;

c) Que des mesure doivent être prévues pour éviter autant que possible, pendant la période de passage à la technique de la bande latérale unique, des brouillages nuisibles entre les stations qui utilisent la technique de la double bande latérale et les stations qui utilisent la technique de la bande latérale unique;

décide

1. Que le passage à la technique de la bande latérale unique des stations visées au considérant *a*) ci-dessus s'effectuera aux dispositions ci-après:

1.1. La fréquence porteuse de la voie à bande latérale unique située dans la partie supérieur de l'ancienne voie à double bande latérale, sera la même que la fréquence porteuse de cette voie;

1.2. La fréquence porteuse de la voie à bande latérale unique située dans la partie inférieure de l'ancienne voie à double bande latérale, sera inférieure de 3 kHz à la fréquence porteuse de cette voie lorsque cette dernière fréquence est supérieure de 6 kHz au moins à la fréquence porteuse de la voie radiotéléphonique à double bande latérale adjacente;

1.3. Dans la Région 1, la fréquence porteuse de la voie à bande latérale unique située dans la partie inférieure de l'ancienne voie à double bande latérale pour les communications entre navires sera inférieure de 2,5 kHz à la fréquence porteuse de cette voie lorsque cette dernière fréquence est séparée de 5 kHz de la fréquence de la voie radiotéléphonique à double bande latérale immédiatement inférieure;

2. Que les émissions de la classe H3E ne devront pas être utilisées dans les voies à bande latérale unique situées dans la partie inférieure des anciennes voies à double bande latérale.

---

(1) Remplace la Résolution Nº Mar4 de la Conférence administrative mondiale des radiocommunications (Génève, 1967).

BB

RÉSOLUTION Nº 308

Relative à l'espacement des fréquences attribuées au service mobile maritime dans la bande 156-174 MHz (1)

(Voir l'appendice 18 et l'article 6)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les fréquences des bandes d'ondes métriques comprises entre 156-174 MHz sont de plus en plus utilisées dans le service mobile maritime;
b) Qu'il existe un besoin accru de voies à ondes métriques à l'usage des opérations portuaires;
c) Qu'il existe un besoin accru de voies à ondes métriques pour la correspondance publique dans le service mobile maritime;
d) Qu'il existe un besoin de voies à ondes métriques pour le service du mouvement des navires;
e) Qu'il est nécessaire de prévoir des voies à ondes métriques pour des utilisations autres que la radiotéléphonie, par exemple le fac-similé et la télégraphie à impression directe à bande étroite;
f) Que les operations de lutte contre la pollution, de recherches et de sauvetage, ainsi que l'exploitation des navires et des brise-glaces nécessitent des voies à ondes métriques pour les communications entre les hélicoptères ou aéronefs légers et les navires;

notant

quel, à la suite de la révision du Règlement des radiocommunications (Génève, 1959) para la Conférence administrative mondiale des radiocommunications (Génève, 1967) et par la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974):

a) L'espacement des voies attribuées au service mobile maritime radiotéléphonique à ondes métriques est en cours de réduction de 50 kHz à 25 kHz;
b) Des voies supplémentaires, numérotées de 60 à 88, ont été obtenues en intercalant des voies espacées de 25 kHz entre les voies espacées de 50 kHz de l'appendice 18 au Règlement des radiocommunications (Génève, 1959);
c) Il convient d'attribuer les voies espacées de 25 kHz sur une base internationale;
d) Le passage d'un espacement de 50 kHz à un espacement de 25 kHz devait se dérouler comme suit:

1) Date à laquelle on a pu comencer à modifier les émetteurs pour qu'ils fonctionnent avec une excursion maximale de ± 5 kHz et à modifier les récepteurs pour augmenter, le cas échéant, leur gain basse fréquence — 1er janvier 1972;
2) Date à laquelle les modifications visées au paragraphe *d*) 1 ont dû être terminées pour tous les appareils existants — 1er janvier 1973;
3) Date jusqu'à laquelle il convenait que les stations côtières conservassent la possibilité de recevoir des émissions avec excursion maximale de ± 15 kHz, et à partir de laquelle il convenait de modifier le plus tôt possible les récepteurs de ces stations afin qu'ils répondissent aux conditions de sélectivité requises por des voies espacées de kHz — 1er janvier 1973;
4) Date à partie de laquelle tous les nouveaux appareils ont dû fonctionner avec un espacement de 25 kHz entre voies — 1er janvier 1973;
5) Date à partie de laquelle les stations ne pourront utiliser que des appareils satisfaisant à l'espacement de 25 kHz entre voies et à partie de laquelle les voies intercalaires pourront être utilisées sans aucune réserve — 1er janvier 1983.

décide

1. Que les administrations peuvent, dans les zones où cela est nécessaire, autoriser l'emploi des voies 60 à 88, à l'exception des voies 75 et 76 qui ont été désignées comme bandes de garde de la voie 16;

2. Que les caractéristiques techniques des appareils destinés à fonctionner dans les voies espacées de 25 kHz dans le service mobile maritime à ondes métriques doivent être conformes aux dispositions de l'appendice 19;

3. Que, pour le 1er janvier 1983, tous les appareils devront satisfaire à l'espacement de 25 kHz entre voies et que, à partie de cette date, toutes les voies intercalaires pourront être utilisées sans aucune réserve.

---

(1) Remplace la Résolution Nº Mar2-14 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

AT

RÉSOLUTION Nº 309

Relative à l'utilisation non autorisée des fréquences des bandes attribuées au service mobile maritime (1)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que les observations de contrôle des émissions relatives à l'utilisation des fréquences de la bande 2170-2194 kHz et des bandes attribuées en exclusivité au service mobile maritime entre 4063 kHz et 25 110 kHz montrent qu'un certain nombre des fréquences de ces bandes continuent à être utilisées par des stations de services autres que le service mobile maritime, notamment par des stations de radiodiffusion de grande puissance dont certaines sont exploitées en contravention aux dispositions du numéro **2665** du Règlement des radiocommunications;

b) Que ses stations causent ainsi des brouilages préjudiciables aux communications échangées dans ce service et qu'un très grand nombre d'émissions dont les sources n'ont pas pu être indentifiées avec certitude ont été observées dans les bandes en question;

c) Que les radiocommunications constituent le seul moyen de communications dont dispose le service mobile maritime;

considérant en particulier

d) Qu'il est essentiel que les voies servant à l'acheminement du trafic de détresse et de sécurité soient exemples de brouilleges préjudiciables, en raison de la nécessité absolue de sauvergarder la vie humaine et les biens;

décide de prier instamment les administrations

1. De faire en sorte que des stations appartenant à des services autres que le service mobile maritime s'abstiennent d'utiliser les fréquences situées dans les voies de détresse et de sécurité dans les bandes de grade de ces voies et dans les bandes attribuées en exclusivité au service mobile maritime, sauf dans les conditions expressément stipulées aux numéros **342**, **518**, **519**, **522** ou **956** à **958** du Règlement des radiocommunications;

2. De continuer à tout mettre en œuvre pour identifier et localiser la source de toute émission non autorisée susceptible de mettre en danger des vies humaines et des biens et de communiquer à l'IFRB les renseignements obtenus;

3. De participer aux programmes de contrôle des émissions que l'IFRB pourra organiser en exécution des dispositions de la presente Résolution;

4. De demander à leurs gourvernements respectifs de promulguer toute législation qu'ils jugeron nécessaire pour interdire aux stations situées au large de leurs côtes de contrevenir aux dispositions du numéro **2665** du Règlement des radiocommunications;

de charger l'IFRB

1. De continuer d'organiser à intervalles réguliers des programmes de contrôle des émissions dans les voies de détresse et de sécurité, dans les bandes de garde de ces voies et dans les bandes attribuées exclusivité au service mobile maritime entre 4063 kHz et 26 175 kHz, en vue d'identifier les stations d'autres services fontionnant dans ces bandes;

2. De prendre les dispositions nécessaires en vue de l'élimination des émissions des stations d'autres services fonctionnant dans ces bandes, émissions qui causent des brouillages préjudiciables au service mobile maritime ou qui sont susceptibles de lui en causer;

3. De rechercher, selon les besoins, la collaboration des administrations d'une part pour identifier les sources de ces émissions en employant tous les moyens disponibles, d'autre part pour obtenir la cessation de ces émissions.

CN

RÉSOLUTION Nº 310

Relative aux fréquences à prevoir en vue de l'établissement et de la mise en œuvre future des systèmes de télémesures, de télécommande et d'echange de données pour des mouvements des navires

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) La nécessité de spécifier des fréquences radioélectriques que pourra utiliser le service mobile maritime à l'échelon mondial, pour répondre aux besoins des mouvements des navires, à l'aide de techniques d'échange automatique de données numériques, de télémesures et de télécommande;

---

(1) Remplace la Résolution Nº Mar2-15 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

b) Les développements qui sont actuellement en cours dans différentes portions du spectre des fréquences, et en raison desquels il faudra à l'avenir prévoir des bandes des fréquences communes pour assurer une utilisation efficace du spectre;
c) L'importance des systèmes de communication correspondants, à courte distance, pour la sécurité et l'efficacité de l'exploitation des navires;
d) Les avantages que ces systèmes apportent aux autorités portuaires du point de vue de la sécurité et de l'efficacité de la gestion des ports et des opérations portuaires;

notant

a) Que, d'après les conclusions de la Réunion spéciale préparatoire du CCIR, les fréquences de 10 GHz semblent satisfaisantes pour de tels systèmes automatiques pour communications à courte distance;
b) Que des renseignements complémentaires opérationnels et techniques doivent encore être fournis pour permettre de déterminer l'utilisation la plus efficace possible du spectre, ainsi que les critères de partage;

décide

1. Que la prochaine conférence administrative mondiale des radiocommunications compétente devra examiner les fréquences pouvant être utilisées pour ces opérations, à la lumière des études ultérieures qui auront été effectuées;
2. Que le CCIR devra étudier la question des largeurs de bande et des formes de présentation des données, et donner son avis à ce sujet, en coordonnant ses travaux aavec les administrations qui mettent au point et qui expérimentent les systèmes de transmission numériques;

prie le Secrétaire général

de soumettre la présente Résolution à l'Organisation intergouvernementale consultative de la navigation maritime (OMCI), em l'invitant à définir les besoins opérationnels en matière d'échange de données avec des navires utilisant les techniques de transmission numériques, et de formuler des recommandations propres à aider les administrations à préparer une future conférence.

DB

RÉSOLUTION Nº 311

Relative à l'introdution d'un système d'appel sélectif numérique pour répondre aux besoins du service mobile maritime (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il existe un besoin urgent de disposer d'un seul et unique système d'appel sélectif numérique pour répondre aux besoins du service mobile maritime dans le monde entier;
b) Que l'Organisation intergouvernementale consultative de la navigation maritime (OMCI) (2) a fait connaître à la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974) ainsi qu'au CCIR, ses besoins d'un système d'appel sélectif à des fins générales permettant de faciliter la transmission et la réception de toutes les communications;
c) Que les articles 25, 60, 62 et 65 du Règlement des radiocommunications prévoient l'utilisation d'un tel système;
d) Que les études concernant les caractéristiques techniques et d'exploitations d'un tel système, effectuées par le CCIR dans le cadre de sa Question 9-3/8 sont déjà très avancées;
e) Que les règles techniques applicables aux systèmes, telles qu'elles sont définies dans le Règlement des radiocommunications, sont essentiellement fondées sur les Avis du CCIR;
f) Que les Assemblées plénières du CCIR ont lieu tous les trois ans, alors que les conférences administratives des radiocommunications, lesquelles sont habilitées à modifier le Règlement des radiocommunications et procédent à ces modifications en faisant largement appel aux Avis du CCIR, se tiennent moins fréquemment et beaucoup moins régulièrement;

est d'avis

a) Que les Assemblées plénières du CCIR adopteront sans doute des Avis concernant les caractéristiques techniques et d'exploitation applicables à un seul et unique système d'appel sélectif numérique;
b) Qu'il convient que les administrations bénéficient des Avis les plus récents du CCIR concernant les systèmes d'appel sélectif destinés au service mobile maritime;

---

(1) Remplace la Résolution N° Mar2-19 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).
(2) Résolution A.420 (XI) de l'OMCI.

décide en conséquence

1. D'inviter le CCIR à déterminer ses travaux pour répondre á la Question 9.3/8 et à établir dès que possible des Avis concernant les caractéristiques techniques et d'exploitation d'un système sélectif numérique;

2. Qu'il convient que chaque Assemblée pléniere du CCIR fasse le nécessaire pour porter à la connaissance du Secrétaire général de l'UIT les Avis du CCIR qui peuvent influer sur les critères techniques et d'exploitation relatifs à l'introduction d'un seul et unique système d'appel sélectif numérique dans le service mobile maritime;

3. Que, après leur avoir communiqué les textes pertinents du CCIR, le Secrétaire général écrira aux administrations en leur demandant d'indiquer, dans un délai de quatre mois, les Avis du CCIR ou les caractéristiques techniques et d'exploitation définies dans les Avis mentionnés au paragraphe 1 ci-dessus qu'elles choisissent d'appliquer dans le cadre des dispositions appropriées du Règlement des radiocommunications;

4. Que, passé ce délai, le Secrétaire général enverra aux administrations un résumé des réponses reçues.

DA

RÉSOLUTION Nº 312

Relative à l'introduction de nouvelles procédures d'appel en télégraphie Morse A1A à ondes décamétriques (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il est nécessaire d'utiliser de façon plus efficace le spectre des fréquences radioeléctriques ainsi que le temps de travail du personnel d'exploitation à bord des navires;

b) Qu'il est souhaitable d'améliorer l'efficacité de l'appel dans les bandes utilisées pour la télégraphie Morse A1A à ondes décamétriques;

c) Que la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974) a adopté une nouvelle procédure d'appel pour la télégraphie Morse A1A à ondes décamétriques (article 63 et appendice 34);

d) Que pour assurer l'efficacité de cette nouvelle procédure d'appel, il faut que les administrations s'entendent au sujet des groupes indiqués à l'appendice 34, conformément à une répartition planifiée des stations côtières sur une base régionale et en fonction du trafic;

e) Que les administrations ayant participé à la Conférence de 1974 ont adopté le Plan de répartition (annexé à la presente Résolution) des stations côtières classées en quatre groupes par pays et par zones, afin d'assurer une meilleure répartition des apels;

invite

les administrations qui assurent un service international de correspondance publique à indiquer, en vue de la publication dans la Nomenclature des stations côtières, les vacations au cours desquelles la veille sera maintenue sur la ou les voies communes et, si nécessaire, la ou les voies de groupes;

invite en outre

les administrations qui désirent s'intégrer à un groupe du Plan de répartition, ou les administrations déjà incluses dans le Plan et qui désirent apporter une modification à ce Plan, à coordonner, dans toute la mesure du possible, les modifications envisagées avec les autres administrations intéressées et susceptibles d'être affectées qui figurent dans le groupe en question. Une administration qui a décidé de s'intégrer à un groupe en question. Une administration qui a décidé de s'intégrer à un groupe ou de changer de groupe dans le Plan fera part au Secrétaire général de sa décision qui sera publiée dans l'annexe à la Nomenclauture des stations côtières;

charge le Secrétaire général

1. De porter la présente Résolution à la connaissance de toutes les administrations dont dépendent des stations côtières dans le pays ou les zones figurant dans le plan de répartition, afin d'obtenir l'accord de ces administrations sur ce Plan ou sur des rectifications à ce Plan pour satisfaire leurs besoins;

2. De mettre à jour, compte tenu des résultats de cette consultation avec les administrations intéressées, le Plan de répartition qui se trouve annexé à la Nomenclature des stations côtières;

3. De publier toute modification du Plan de répartition dans le *Bulletin d'Exploitation*, avant la publication de toute révision du Plan dans la Nomenclature des stations côtières.

---

(1) Remplace la Résolution Nº Mar2-5 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

DD RÉSOLUTION Nº 313

Relative à l'introduction d'un nouveau système d'identification des stations du service mobile maritime et du service mobile maritime par satellite (identités dans le service mobile maritime)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) La nécessité d'attribuer aux fins le la sécurité et des télécommunications, une identité propre à chaque navire;
b) La nécessité de faire en sorte que cette identité soit utilisable dans le systèmes automatiques;
c) Le fait que, pour arriver à un format d'adresse commun convenant aux systèmes automatiques, les identités assignées aux stations de navire, aux stations terriennes de navire, aux stations côtières, aux stations terriennes côtières et celles utilisées pour les appels de groupe doivent être d'une nature similaire lorsqu'elles sont transmises sur le trajet radioéléctrique;

considérant de plus

a) Qu'il est très souhaitable que le code constitué par l'identité de la station de navire ou une partie de ce code puisse être utilisé par les abonnés aux réseaux publics avec commutation pour appeler les navires en exploitation automatique;
b) Que, dans certains pays, les réseaux publics commutés sont soumis à des limitations concernant le nombre maximal des chiffres pouvant être utilisés pour composer (au cadran ou au clavier) l'identité de la station de navire;
c) Qu'un Avis du CCITT (1) décrit une méthode d'identification des stations de navire qui tient compte de cette contingence;
d) Que, dans l'intérêt du développement de l'exploitation automatique dans les sens côtière-navire, les limitations, quelles qu'elles soient, devraient être réduites au minimum;

notant

que le CCIR étudie la mise en œuvre du nouveau système d'identités pour les stations du service mobile maritime et du service mobile maritime par satelllite;

décide

que, dans les administrations qui utilisent cette forme d'identification pour les stations du service mobile maritime et du service mobile maritime par satellite, l'attribution des identités se fera conformément aux dispositions de l'appendice

(1) Avis du CCITT E.210/F.120.

43 en attendant la décision appropriée de la prochaine conférence administrative mondiale des radiocommunications compétente;

invite les administrations

à continuer á participer aux études du CCIR et du CCITT en cette matière;

prie le Secrétaire général

de préparer le tableau des chiffres d'identification de nationalité (NID), en collaboration étroite avec le CCIR et le CCITT, et de présenter ce tableau à l'examen de la prochaine conférence administrative mondiale des radiocommunications compétente, pour inclusion dans l'appendice 43.

AR

RÉSOLUTION Nº 314

Relative à l'établissement d'un système mondial coordonné pour le rassemblement des données concernant l'océanographie (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le désir a été exprimé de voir établier un système mondial coordonée de rassemblement des données concernant l'océanographie;

b) Que, dans chacune des six bandes d'ondes décamétriques attribués en exclusivité au service mobile maritime, la Conférence administrative mondiale des radiocommunications (Génève, 1967) a désigné une bande de fréquences destinée à être utilisée, conformément aux dispositions de l'appendice 31 au Règlement des radiocommunications pour le rassemblement des données concernant l'océanographie;

c) Que les bandes de fréquences dont il s'agit ne seront utilisées avec le maximum de rendement que moyennant la collaboration des administrations et la coordination à laquelle elles procéderont;

d) Que certaines administrations ont manisfesté le désir qu'un système mondial coordoné de transmission des données concernant l'océanographie soit établi sur la base d'un plan coordonné dans les bandes attribuées par la présent Conférence;

e) Que d'autres administrations souhaient cependant utiliser dans un proche avenir des stations de rassemblement des données concernant l'océanographie dans le cadre des décisions prises sur cette question par la présente Conférence;

f) Qu'il convient par conséquent d'établir un programme coordonné de rassemblement des données concernant l'océanographie dans les bandes de fréquences dont il est question à l'alinéa *b*) ci-dessus;

g) Que la Commission océanographique intergouvernementale (COI) et l'Organisation météorologique mondiale (OMM) se concertent depuis 1962 sur les efforts de coopération à accomplir dans le domaine du rassemblement des données concernant l'océanographie (par exemple, le Groupe d'experts OMM/COI chargé d'étudier la coordination des besoins, Génève, 19-21 juillet 1967);

décide

1. D'inviter la COI et l'OMM à établir en commun, de concert avec l'IFRB et, selon le cas avec les administrations des Membres, un plan coordoneé conçu de façon à satisfaire les besoins présents et futurs de tous les Membres intéressées et à permettre aux stations participant au rassemblement des données concernant l'océanographie de fonctionner dans un système mondial dans le cadre des dispositions prises par la présente Conférence relativement à un tel système; ce plan devra comporter l'indications de la répartition géographique des stations océanographique, de leur mode d'exploitation, de l'utilisation des fréquences dans le système et de la façon dont les renseignements océanographiques sont à transmettre;

2. D'inciter les administrations à assigner, pour la partie du système mondial qui relève de leur juridiction, des fréquences conformes au plan ci-dessus ainsi qu'aux recommandation de la COI et de l'OMM;

3. D'inviter de plus la COI et l'OMM à assumer en commun, de concert avec l'IFRB, la responsabilité de tenir le plan à jour, compte tenu de l'évolution des besoins en données concernant l'océanographie;

4. Que la prochaine conférence administrative des radiocommunications compétente pour traiter de questions concernant le service mobile maritime devra prendre en considération le plan dont il est question aux paragraphes 1 et 3 ci-dessus, afin de déterminer les modifications éventuellement nécessaires pour améliorer son efficacité.

---

(1) Remplace la Résolution N° Mar20 de la Conférence administrative mondiale des radiocommunications (Génève, 1967).

AC

RÉSOLUTION N° 315

Relative à la suppression éventuelle des taxes de station mobile pour la correspondance publique du service mobile maritime

La Conférence administrative mondiale des radiocommunications (Genève, 1979).

considérant

a) Que la VI[e] Assemblée plénière du CCITT (Genève, 1976) a adopté le projet d'Avis concernant la taxation, la comptabilité et le remboursement dans le service mobile maritime à l'exception des points concernant notamment les taxes de station mobile pour la correspondance publique dans le service mobile maritime;

b) Que le projet d'Avis ci-dessus a été ultérieurement modifié, à la lumière de la décision prise par la VI[e] Assemblée plénière (Genève, 1976) concernant les taxes de station mobile; et que ce projet d'Avis a été approuvé à la suite par vote par correspondance;

c) Que l'Avis modifié conprend les dispositions suivantes (1):

> Les taxes de station mobile peuvent être appliqueés aux services de radiotélégraphie publique, de radiotéléphonie et de radiotélex assurés en ondes hectométriques et décamétriques. Elles ne doivent s'appliquer à aucun des services fonctionnant en ondes métriques, ni à aucun des services mobiles par satellite, ni à aucun service exploité automatiquement; toutefois, les taxes de station mobile peuvent aussi s'appliquer aux radiotélégrammes transmis sur ondes métriques.
>
> Les taxes de station mobile devront être abolies pour le trafic acheminé après 23 h 59 TMG le 31 décembre 1987.

décide

d'adopter la date recommandée pour la suppression des taxes de station mobile pour la correspondance publique dans le service mobile maritime.

CE

RÉSOLUTION N° 316

Relative à la coopération technique avec les pays en développement dans le domaine des radiocommunications maritimes (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

ayant noté

que l'assistance fournie par l'Union, de concert avec d'autres organisations, notamment l'Organisation intergouvernementale consultative de la navigation maritime (OMCI), dans le domaine des télécommunications maritimes, aux pays en développement, permet de bien augurer de l'avenir;

consciente

a) Du fait que le pays en développement ont besoin, pour intensifier leurs échanges commerciaux, d'accroître l'activité de leur marine marchande et d'attirer le trafic maritime d'autres pays;

b) Du rôle important que jouent les télécommunications dans les activités maritimes du monde entier, qu'il s'agisse de l'économie ou de la sécurité;

c) De la possibilité de donner à la marine marchande des moyens de sécurité satisfaisants et de meilleures perspectives économiques, tout en consacrant des sommes relativement modestes à la mise en place et à l'exploitation de services de télécommunications maritimes;

considérant

a) Que, pour de nombreux pays en voie de développement, il est nécessaire de renforcer l'efficacité des services intéressant:

> La sécurité de la navigation et la sauvegarde de la vie humaine en mer;
> La rentabilité des opérations portuaires;
> La correspondance publique destinée aux passagers et aux membres des équipages;

---

(1) Voir l'Avis D.90/F.111 du CCITT (paragraphes B12 et B13).

(2) Remplace la Résolution N° Mar2-18 de la La Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

b) Qu'il serait possible, à cet égard, d'étendre les activités de coopération technique de l'Union, de manière à fournir à ces pays une assistance des plus valables;

décide d'inviter le Secrétaire général

1. À offrir l'assistance de l'Union aux pays en développement qui s'effortent d'améliorer leurs télécommunications maritimes, en leur fournissant notamment des avis techniques concernant la mise en place, l'exploitation et la maintenance du matériel, ainsi qu'en contribuant à la formation professionnelle du personnel;

2. À demander pour ce faire, la collaboration de l'OMCI, de la Conférence des Nations Unies pour le commerce et le développement (CNUCED), d'autres institutions spécialisées des Nations Unies selon le cas;

3. À continuer de rechercher avec une attention particulière l'aide du Programme des Nations Unies pour le développement (PNUD) et d'autres sources de financement pour permettre à l'Union d'apporter une assistance technique à la fois suffisante et efficace en matière de télécommunications maritimes, le cas échéant en collaboration avec d'autres institutions spécialisées concernées;

d'inviter les pays Membres

à contribuer, en priorité, dans la mesure de leurs possibilités et de l'état de développement de leur technique, à la coopération technique fournie par l'Union aux pays en développement dans le domaine des télécommunications maritimes, en facilitant le recrutement d'experts qui devront être envoyés en mission pour travailler dans ces pays, en accueillant des stagiaires titulaires de bourses d'études octroyées par l'Union et venant desdits pays, en envoyant des conférenciers aux cycles d'études organisés par l'Union et, si celle-ci le leurs demande, en lui donnant des avis sur des questions techniques;

d'inviter les pays en développement

à inclure, selon leurs besoins, dans leurs programmes nationaux de demande d'assistance technique extérieure, les projets concernant les télécommunications maritimes et à soutenir les projets multinationaux dans ce domaine.

BH RÉSOLUTION N° 400

Relative au traitement des fiches de notification concernant les assignations de fréquence aux stations aéronautiques dans les bandes attribuées en exclusivité au service mobile aéronautique (R) entre 2850 kHz et 22 000 kHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les Actes finals de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) sont entrés en vigueur le 1er septembre 1979;

b) Que le nouveau plan d'allotissement de fréquences contenu dans l'appendice 27 Aer2 entrera en vigueur le 1er février 1983, á 1 heure UTC;

c) Que certaines administrations peuvent désirer mettre en application certaines dispositions du nouveau Plan d'allotissement de fréquences avant la date spécifiée pour son entrée en vigueur dans les cas où des brouillages préjudiciables ne seront pas ainsi causés au service assuré par les stations fonctionnant conformément au Plan actuel d'allotissement de fréquences;

d) Qu'il est, en conséquence, nécessaire de prévoir une procédure intérimaire pour faciliter le passage du Plan actuel au nouveau Plan d'allotissement des fréquences;

décide

1. Que pendant la période transitoire qui s'écoulera entre la date d'entrée en vigueur des Actes finals susmentionnés et la date d'entrée en vigueur du nouveau Plan d'allotissement de fréquences;

1.1. Les dispositions des numéros **1334** à **1341** du Règlement des radiocommunications continueront d'être appliquées au cours de l'examen des fiches de notification concernant les assignations de fréquence aux stations aéronautiques du service mobile aéronautique (R), conformément aux allotissements du Plan existant;

1.2. Toutes ces assignations seront inscrites dans le Fichier de référence international des fréquences conformément aux conclusions formulées par l'IFRB;

1.3. L'IFRB examinera les assignations de fréquence dans une voie du nouveau Plan afin de déterminer si les allotissements du Plan existant bénéficient de la protection spécifiées dans l'appendice 27 Aer2 (partie I, section II-A,

(1) Remplace la Résolution N° Aer2-5 de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978).

paragraphe 5). En procédent à cet examen, le Comité admettra que la fréquence en question sera utilisée conformément aux critères de partage entre les zones spécifiés dans l'appendice 27 Aer2 (partie I, section II-B, paragraphe 4);

1.4. Toute assignation conforme aux dispositions du paragraphe 1.3 ci-dessus et qui aura fait l'objet d'une conclusion favorable sera insérée dans le Fichier de référence;

1.5. La date à inscrire dans la colonne 2a ou dans le colonne 2b du Fichier de référence sera déterminée comme suit:

a) Si la conclusion est faborable relativement aux numéros **1336 à 1339,** la date du 29 avril 1966 sera inscrite dans la colonne 2a;

b) Si la conclusion est favorable relativement au numéro **1341,** la date du 29 avril 1966 sera inscrite dans la colonne 2b;

c) Pour toutes les autres assignations (y compris celles qui pourraient être conformes au nouveau plan d'allotissement de fréquences, mais non au Plan actuel), la date à inscrire dans la colonne 2b sera la date à laquelle l'IFRB aura reçu la fiche de notification;

1.6. Toute assignation conforme au nouveau Plan d'allotissement de fréquences sera spécifiée comme telle au moyen d'un symbole convenable que l'IFRB insérera dans la colonne «Observations» du Fichier de référence;

2. Qu'à la date d'entrée en vigueur du nouveau Plan d'allotissement de fréquences, l'IFRB examinera les assignations de fréquence aux stations aéronautiques du service mobile aéronautique (R) inscrites dans le Fichier de référence international des fréquences dans les bandes attribuées en exclusivité à ce service entre 2850 kHz et 22 000 kHz, du point de vue deleur confromité au nouveau Plan d'allotissement de fréquences, en suivant à cet effet les parties pertinentes de la procédure décrite aux numéros **1334** à **1341** du Règlement des radiocommunications et il inscrira en regard de ces assignations, dans la colonne 2a ou la colonne 2b du Fichier de référence internationale des fréquences, une date déterminée comme suit:

2.1. Pour les assignations avec émission en double bande latérale (A3E) qui sont déjà inscrites au Fichier de référence à la date d'entrée en vigueur du nouveau Plan d'allotissement de fréquences, cette date continuera d'être celle qui est inscrite dans la colonne 2a ou dans la colonne 2b, selon le cas, jusqu'au 1er février 1983. Une date figurant dans la colonne 2a pour une assignation de fréquence utilisant la double bande latérale (A3E) sera transférée dans la colonne 2b le 2 février 1983. Le 1er janvier 1987, l'IFRB examinera les inscriptions et, après consultation des administrations intéressées, annulera les inscriptions qui ne seront plus en usage, en conservant les autres pour information seulement, sans date dans la colonne 2b;

2.2. Si la conclusion est favorable relativement aux numéros **1335** à **1339,** la date du 5 mars 1978 sera inscrite dans la colonne 2a;

2.3. Si la conclusion est favorable relativement aux numéros **1335** et **1341,** la date du 5 mars 1978 sera inscrite dans la colonne 2b;

2.4. Pour toutes les autres assignations, la date du 6 mars 1978 sera inscrite dans la colonne 2b;

3. Qu'à la date d'entrée en vigueur du nouveau Plan d'allotissement de fréquences, les allotissements qui figurent dans ce plan remplaceront, dans le Fichier de référence international des fréquences, les allotissements qui figurent dans le Plan actuel;

invite les administrations

à notifier dès que possible à l'IFRB l'anulation des assignations de fréquence dont l'utilisation sera abandonnée par suite de la mise en service des allotissements du nouveau plan.

BI RÉSOLUTION N° 401

Relative à la mise en œuvre du Plan d'alllotissement de fréquences dans les bandes attribuées en exclusivité au service mobile aéronautique (R) entre 2850 kHz et 22 000 kHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les bandes attribuées en exclusivité entre 2850 kHz et 22 000 kHz au service mobile aéronautique (R) par la Conférence administrative des radiocommunications (Génève, 1959) ont été modifiées par la Conférence administrative extraordinaire des radiocommunications aéronautiques (Génève, 1966);

b) Que la Conférence administrative extraordinaire des radiocommunications aéronautiques (Génève, 1966) a institué des procédures destinées à être appliquées par les administrations en ce qui concerne la mise en æuvre des modifications;

c) Que les dispositions ont été prises pour que l'IFRB mette ces procédures à exécution;

---

(1) Remplace la Résolution N° Aer2-4 de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978).

reconnaissant

a) Que le service mobile aéronautique (R) est avant tout un service de sécurité;

b) Que la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) a apporté de nouvelles modifications auxdites bandes afin de tenir compte des techniques de la bande latérale unique;

c) Qu'il est nécessaire que toutes les administrations mettent en œuvre les modifications apportées par cette Conférence, en vue d'éviter des brouillages préjudiciables aux services assurés par des stations fonctionnant conformément aux dispositions du Règlement des radiocommunications;

décide

1. Que, trois mois au plus tard avant la date d'entrée en vigueur du nouveau Plan, les administrations notifieront à l'IFRB les modifications destinées à rendre conformes à ce Plan les inscriptions figurant déjà dans le Fichier de référence;

2. Que les assignations inscrites dans le Fichier de référence à la date du 1er février 1983 et qui ne seront pas conformes, à cette date, aux décisions de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) seront traitées comme suit:

2.1. L'IFRB fera parvenir aux administrations intéressées, dans les trente jours qui suivront le 1er février 1983, des extraits pertinents du Fichier de référence, en les informant que, conformément aux termes de la présente Résolution, les assignations en cause devront être transférées sur les fréquences appropriées dans un délai de six mois après la date d'expédition desdits extraits;

2.2. Si une administration ne notifie pas ce transfert à l'IFRB dans le délai prescrit, l'inscription existante sera maintenue dans le Fichier de référence, sans indication de date dans la colonne 2 et avec une observation appropriée dans la colonne «Observations». Les administrations seront informées de cette mesure;

3. Que, si une administration le désire, l'IFRB lui accordera toute l'aide nécessaire. En pareil cas, l'IFRB appliquera les dispositions des numéros **1445** à **1449** du Règlement des radiocommunications.

BG RÉSOLUTION Nº 402

Relative à la mise en œuvre du nouvel arrangement applicable aux bandes attribuées en exclusivité au service mobile aéronautique (R) entre 2850 kHz et 22 000 kHz(1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que l'utilisation de chacune des bandes de fréquences comprises entre 2850 kHz et 22 000 kHz et attribuées en exclusivité au service mobile aéronautique (R) par la Conférence administrative des radiocommunications (Génève, 1959) a été modifiée par la Conférence administrative extraordinaire des radiocommunications aéronautiques (Génève, 1966);

b) Que la Conférence administrative extraordinaire des radiocommunications aéronautiques (Génève, 1966) a décidé que les administrations devraient remplacer progressivement et le plus tôt possible, dans leurs radiocommunications du service mobile aéronautique (R), la technique de la double bande latérale par la technique de la bande latérale unique, en conséquence de quoi l'utilisation des bandes en question a été modifiée à nouveau par la Conférence administrative mondiale de radiocommunications du service mobile aéronautique (R) (Génève, 1978) pour permettre l'utilisation de la technique de la bande latérale unique;

c) Qu'un très grand nombre des assignations de fréquence aux stations d'aéronef et aux stations aéronautiques seront transférées actuelles aux nouvelles fréquences et voies désignées par cette Conférence;

d) Que les changements d'assignations des fréquences devraient être effectués dès que possible afin que les avantages qu'offrent les nouvelles voies désignées par cette Conférence puissent se matérialiser dès que possible;

e) Que le transfert des assignations devrait être réalisé en perturbant le moins possible le service rendu par chaque station;

f) Que le transfert des assignations devrait être réalisés de manière à éviter des brouillages préjudiciables entre les stations intéressées pendant la période de mise en œuvre;

g) Que les Actes finals de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) sont entrés en vigueur le 1er septembre 1979;

h) Que le nouveau Plan d'allotissement des fréquences de l'appendice 27 Aer 2 entrera en vigueur le 1er février 1983;

---

(1) Remplace la Résolution Nº Aer2-3 de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978).

reconnaissant

a) Que le service mobile aéronautique (R) est avant tout un service de sécurité;
b) Que certaines fréquences ont été allouées pour usage mondial;
c) Que la mise en œuvre des décisions de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) relatives au nouvel arrangement des bandes attribuées au Service Aéronautique (R) entre 2850 kHz et 22 000 kHz devrait se dérouler de manière ordonnée pour le transfert des services actuels des anciennes aux nouvelles assignations;

décide

1. Que, pendant la période comprise entre la date d'entrée en vigueur des Actes finals de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) (1er septembre 1979) et la date d'entrée en vigueur du nouveau Plan d'allotissement de fréquences qui figure dans l'appendice 27 Aer2 (1er février 1983), l'utilisation des voies pour toute nouvelle exploitation en bande latérale unique s'effectuera conformément aux dispositions ci-après;

1.1. La fréquence porteuse (fréquence de référence) de la voie à bande latérale unique située dans la partie supérieure de l'ancienne voie à double bande latérale sera la même que la fréquence porteuse (fréquence de référence) de cette voie;

1.2. La fréquence porteuse (fréquence de référence) de la voie à bande latérale unique située dans la partie inférieure de l'ancienne voie à double bande latérale sera inférieure de 3 kHz à la fréquence porteuse (fréquence de référence) de cette voie;

1.3. Avant le 1er février 1983, les stations aéronautiques et les stations d'aéronef dotées d'un équipement à bande latérale unique peuvent utiliser l'une ou l'autre des moitiés de l'ancienne voie à double bande latérale [la fréquence porteuse (fréquence de référence) à bande latérale unique étant celle qui est indiquée aux paragraphes 1.1 et 1.2 ci-dessus];

1.4. Toute administration peut utiliser les voies du nouveau Plan à condition de ne pas causer de brouillages préjudiciables aux utilisateurs des voies du Plan actuel. Pour l'utilisation opérationelle des voies en question, il convient que les administrations tiennent compte des dispositions du Nº 27/20 de l'appendice 27 Aer2 au Règlement des radiocommunications;

2. Que, le 1er février 1983, les fréquences indiquées à l'appendice 27 au Règlement des radiocommunications seront remplacées par les fréquences indiquées dans la partie □, section □, article 2, de l'appendice 27 Aer2;

3. Qu'il est nécessaire que les administrations prennent toutes les mesures appropriées pour passer le plus tôt possible à la technique de la bande latérale unique, en ne permettant plus l'installation de nouveaux équipements à double bande latérale à partir du 1er avril 1981. Les stations d'aéronef et les stations aéronautiques devront pouvoir commencer le plus tôt possible à utiliser des appareils à bande latérale unique; de plus, elles devront cesser de faire des émissions à double bande latérale dans les délais les plus brefs et, en tout état de cause, le 1er février 1983 au plus tard;

4. Que, jusqu'au 1er février 1983, les stations aéronautiques et les stations d'aéronef dotées d'appareils à bande latérale unique devront également être équipées de façon à pouvoir faire, lorsque cela sera nécessaire, des émissions de la classe H3E compatibles avec l'emploi de récepteurs à double bande latérale;

5. Que, sauf dispositions contraires contenues dans les Actes finals de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) à partir du 1er février 1983, seules seront autorisées les classes d'émission H2E, J3E, J2B, J2D et J9X. Toutefois, l'exploitation en double bande latérale pourra être poursuivie pour l'usage national jusqu'au 1er février 1987, à condition que cette exploitation se fasse en conformité avec les dispositions des numéros **299** et **307** du Règlement des radiocommunications et qu'elle ne cause pas de brouillages préjudiciables aux stations assurant des communications internationales dans le service mobile aéronautique (R) dans le mode bande latérale unique. Les administrations qui ont besoin de cette extension de la période d'application intégrale de la bande latérale unique sont, néanmoins, instamment priées de cesser l'exploitation en double bande latérale dès que possible.

CB RÉSOLUTION Nº 403

Relative à l'utilisation des fréquences 3023 kHz et 5680 kHz communes aux services mobiles aéronautiques (R) et (OR)(1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

ayant noté

qu'il semble exister certaines anomalies dans les conditions d'utilisation des fréquences 3023,5 kHz et 5680 kHz stipulées dans l'appendice 26 au Règlement des radiocommunications (Génève, 1959), telles qu'elles sont énoncées dans les

(1) Remplace la Résolution Nº Aer2-1 de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978).

alinéas 2, *a*), et 2, *b*), figurant dans la colonne 3 de l'article 2 du plan d'allotissement de fréquences, et que des mesures ont été prises pour faire disparaître ces anomalies:

considérant

a) Que la coordination des opérations de recherche et de sauvetage sur les lieux d'un sinistre serait améliorée si, au cours de ces opérations l'utilisation des fréquences 3023 (précédemment 3023,5) kHz et 5680 kHz était étendue aux communications entre les stations mobiles et les stations terrestres qui y participent;

b) Qu'il serait dans l'intérêt général du service mobile aéronautique que les mêmes dispositions relatives à l'utilisation des fréquences 3023 (précédemment 3023,5) kHz et 5680 kHz soient appliquées dans le service mobile aéronautique (R) et dans le service mobilwe aéronautique (OR);

décide

d'inviter les administrations à appliquer dans le service mobile aéronautique (OR), à partir de la date d'entrée en vigueur du Plan d'allotissement de fréquences, adopté par la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978), les dispositions régissant l'utilisation des fréquences 3023 kHz et 5680 kHz qui sont stipulées à l'appendice 27 Aer2 (partie II, section II, article 3).

BT RÉSOLUTION Nº 404

Relative à la mise en æuvre de la nouvelle disposition des bandes de fréquences attribuées en exclusivité au service mobile aéronautique (R) entre 21 924 kHz et 22 000 kHz

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que dans sa Recommandation Nº Aer2-5, la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) avait recommandé aux administrations d'étudier les questions concernant l'utilisation future de la bande 21 924-22 000 kHz;

b) Que la présent Conférence a attribué cette bande en exclusivité au service mobile aéronautique (R);

décide

qu'il est nécessaire d'ajouter dans l'appendice 27 Aer2 une bande de fréquences supplémentaire pour mettre en service des fréquences mondiales appropriées aux communications à grande distance et réduite l'encombrement des bandes utilisées actuellement;

charge le Secrétaire général

de publier le nouvel appendice 27 Aer2 adopté par la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) avec l'inclusion d'un Plan pour la bande 21 924-22 000 kHz selon les indications énoncées en annexe à la présente Résolution;

reconnaissant

qu'il risque de résulter des brouillages préjudiciables au service mobile aéronautique (R) dans cette bande si, le 1er février 1983, les assignations existantes dans la bande 21 924-22 000 kHz ne sont pas transférées, soit sur les nouvelles fréquences pour le service mobile aéronautique (R), soit dans d'autres bandes plus appropriées pour les assignations de fréquence aux stations du service fixe aéronautique;

décide

1. Que la mise en œuvre des mesures prises par la présent Conférence concernant la nouvelle disposition de la bande d'ondes décamétriques attribuée au service mobile aéronautique (R) devra s'effectuer selon la procédure méthodique définie ci-après pour le passage des anciennes aux nouvelles assignations;

2. Que les assignations visées au paragraphe 1 doivent être traitées comme suit:

2.1. L'IFRB adressera des extraits pertinents du Fichier de référence aux administrations intéressées, dans un délai de trentre jours à partir do 1er février 1982, en les informant que, conformément aux dispositions de la présente Résolution, les assignations en cause doivent être transférées dans les bandes appropriées dans un délai de six mois près l'envoi de ces extraits;

2.2. Si une administration ne notifie pas le transfert dans le délai prescrit, l'inscription initiale sera maintenue dans le Fichier de référence, sans indication de date dans la colonne 2 et avec une observation appropriée dans la colonne «Observations»; l'administration intéressée sera avisée de cette mesure;

3. Que su une administration le désire, l'IFRB lui prêtera l'assistance nécessaire. Pour ce faire, il appliquera les dispositions des numéros **1445** à **1449** du Règlement des radiocommunications.

ANNEXE À LA RÉSOLUTION Nº 404

Indication de modifications à apporter à l'appendice 27 Aer2 du Règlement des radiocommunications

A. APPENDICE 27 Aer2

Table des matières, *partie II, dans le remplacer la fréquence* 17 970 kHz *par* 22 000 kHz.
Numéro **27/10**, *remplacer* 17 970 kHz *par* 22 000 kHz.
Número **27/16,** *ajouter dans le tableau les nouvelles fréquences suivantes:*

kHz 21 924-22 000	
21 925	21 964
21 928	21 967
21 931	21 970
21 934	21 973
21 937	21 976
21 940	21 979
21 943	21 982
21 946	21 985
21 949	21 988
21 952	21 991
21 955	21 994
21 958	21 997
21 961	
25 voies	

Numéro **27/31A**, *dans le titre qui précéde le numéro* **27/31A**, *remplacer* 18 MHz *par* 22 MHz; *dans le texte du numéro* **27/31A,** *remplacer* 13 MHZ *et* 18 MHz *par* 13 MHz, 18 MHz *et* 22 MHz.
Numéro **27/31B**, *2ª ligne, remplacer* la bande des 18 MHz *par* les bandes des 18 MHz et 22 MHz; *4ª ligne, après* 18 MHz *ajouter* et 22 MHz.

Partie II, *dans le tire, remplacer la fréquence* 17 970 kHz *par* 22 000kHz
Numéro **27/189,** *ajouter dans le tableau la nouvelle colonne suivante pour la bande des* 22 MHz:

Zones	Bandes (MHz) 22 kHz
W I	21 940 21 946 21 952 21 958 21 967 21 973 21 979 21 988 21 997

CC

RÉSOLUTION N.º 405

Relative à l'utilisation des fréquences du service mobile aéronautique (R) (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) a élaboré et adopté un nouveau Plan d'allotissement de fréquences pour l'utilisation des ondes décamétriques par le service mobile aéronautique (R) (appendice 27 Aer2 au Règlement des radiocommunications);
b) Que le trafic aérien est sujet à des changements continuels;
c) Que ces changements doivent être pris en considération par les administrations intéressées; mais
d) Qu'en cherchant à satisfaire les nouveaux besoins en communications il convient de ne prendre aucune décision de nature à empêcher ou à compromettre l'utilisation coordonnée des ondes décamétriques par le service mobile aéronautique (R) telle qu'elle est prévue dans le Plan;

(1) Remplace la Résolution Nº Aer2-7 de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978).

e) Que les familles de fréquences alloties aux zones de passage des lignes aériennes mondiales principales (ZLAMP), aux zones des lignes aériennes régionales et nationales (ZLARN), ainsi qu'aux subdivisions de ces zones et aux zones VOLMET ont été choisies tenu des conditions de propagation qui permettent le choix de fréquences convenant le mieux aux distances considérées;

f) Qu'il convient de prendre des mesures pour que l'ordre de grandeur des fréquences utilisées soit correct;

g) Qu'il est essentiel de répartir le trafic de communications aussi uniformément que possible entre les fréquences disponibles;

h) Que des fréquences ont été alloties pour une utilisation mondiale;

décide

que les administrations prendront, à titre individuel ou en collaboration, les mesures nécessaires afin:

1. D'assurer l'utilisation aussi large que possible de fréquences plus élevées afin de diminuer le trafic dans les bandes d'ondes décamétriques du service mobile aéronautique (R);

2. D'utiliser autant que possible des antennes ayant une directivité et un rendement appropriés, afin de réduire au minimum les risques de brouillages mutuels à l'intérieur d'une zone ou entre plusieurs zones;

3. De coordonner l'utilisation des familles de fréquences nécessaires pour un tronçon de ligne déterminé, conformément aux principes techniques exposés dans l'appendice 27 Aer2, et en tenant compte des données disponibles sur les conditions de propagation, afin que les fréquences qui conviennent le mieux soient utilisées pour la liaison entre le sol et un aéronef situé à une distance donnée de la station aéronautique qui assure le service sur le tronçon de ligne considéré;

4. D'améliorer les techniques et les procédures d'exploitation et d'utiliser le matériel qui permettra d'obtenir le rendement le plus élévé possible des communications air-sol sur ondes décamétriques;

5. De ressembler des données techniques précises sur le fonctionnement de leurs systèmes de communication sur ondes décamétriques, notamment des données ayant une influence sur les normes techniques et d'exploitation, afin de faciliter un réexamen du Plan;

6. De déterminer, au moyen d'arrangements régionaux, la meilleure méthode permettant d'assurer les communications nécessaires sur toute nouvelle ligne aérienne régionale ou internationale à longue distance, qui n'est pas ou ne peut pas être desservie dans le cadre des ZLAMP et des ZLARN, de manière à ne pas créer de brouillage préjudiciable dans l'utilisation des fréquences prévues dans le Plan.

BL RÉSOLUTION N° 406

Relative à l'utilisation de bandes de fréquences supérieures aux bandes d'ondes décamétriques, pour les communications et la diffusion de renseignements météorologiques dans le service mobile aéronautique (R) et le service mobile aéronautique par satellite (R) (1).

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que, du point de vue du service mobile aéronautique, les bandes de fréquences supérieures aux bandes d'ondes décamétriques permettent d'assurer des communications plus sûres et mieux protégées contre les brouillages que les communications en ondes décamétriques;

b) Que du point de vue technique ainsi que du point de vue de l'exploitation, l'utilisation des ondes métriques par l'aviation a fait des progrès notables;

c) Que la possibilité d'établir, à l'avenir, des communications par satellite est à présent reconnue;

d) Qu'en raison du développement constant des télécommunications aéronautiques dans toutes les régions du monde il existe une demande accrue de fréquences pour l'établissement de communications avec les aéronefs en vol et la diffusion de renseignements météorologiques à ces aéronefs;

décide

qu'il convient que les administrations envisagent, dans toute la mesure du possible, compte tenu des impératifs économiques et techniques, d'utiliser, pour répondre à leurs besoins de communications et de diffusion de renseignements météorologiques, des fréquences choisies dans des bandes de frequences supérieures aux bandes d'ondes décamétriques, attribuées au service mobile aéronautique (R) et au service mobile aéronautique par satellite (R).

---

(1) Remplace la Résolution N° Aer2-6 de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978).

BF RÉSOLUTION Nº 407

Relative à l'utalisation non autorisée des fréquences des bandes attribuées au service aéronautique (R) (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les observations de contrôle des émissions relatives à l'utilisation des fréquences des bandes attribuées en exclusivité ao service mobile aéronautique (R) entre 2850 kHz et 22 000 kHz montrent qu'un certain nombre de fréquences de ces bandes sont encore utilisées par des stations appartenant à des services autres que le service mobile aéronautique (R), notamment par des stations de radiodiffusion à grande puissance, dont certaines fonctionnent en contravention des dispositions du numéro **2665** du Règlement des radiocommunications;

b) Que ces stations causent ainsi des brouillages préjudiciables au service mobile aéronautique (R) et qu'un très grand nombre d'émissions dont les sources n'ont pas pu être identifiées avec certitude ont été observées dans les bandes en question;

c) Que les radiocommunications constituent le seul moyen de communication à la disposition du service mobile aéronautique (R) et que ce service est un service de sécurité;

considérant, en particulier

d) Qu'il est essentiel que les voies directement utilisées pour le fonctionnement des services de transport aérien dans de bonnes conditions de sécurité et de régularité soient exemples de brouillages préjudiciables, étant donné que ces voies sont indispensables à la sauvegarde de la vie humaine et des biens;

décide de prier instamment les administrations

1. De faire en sorte que des stations appartenant à des services autres que le service mobile aéronautique (R) s'abstiennent d'utiliser les fréquences des bandes attribuées à ce service, sauf dans le contidions stipulées aux numéros **342** et **956** du Règlement des radiocommunications;

2. *a*) De ne ménager aucun effort pour identifier et localiser la source de toute émission non autorisée capable de causer des brouillages préjudiciables au service mobile aéronautique (R) et susceptible de ce fait, de mettre en danger ce service de sécurité;

b) Et de communiquer leurs résultats à l'IFRB;

3. De participer aux programmes de contrôle des émissions que l'IFRB pourra être amené à organiser comme suite à la présente Résolution;

4. De demander à leurs gouvernements respectifs de promulguer telle législation qui pourra être nécessaire pour empêcher les stations situées à bord d'aéronefs de fonctionner en contravention des dispositions du numéro **2665** du Règlement des radiocommunications;

de charger l'IFRB

1. De continuer à organiser des programmes de contrôle des émissions dans les bandes attribuées en exclusivité au service mobile aéronautique (R), dans le dessein d'éliminer les émissions des stations d'autres services fonctionnant dans ces bandes, émissions qui causent des brouillages préjudiciables au service mobile aéronautique (R) ou sont susceptibles d'en causer;

2. De prendre les mesures nécessaires pour éliminer les émissions d'autres services fonctionnant dans ces bandes, émissions qui causent des brouillages préjudiciables au service mobile aéronautique (R) ou sont susceptibles d'en causer;

3. De rechercher, le cas échéant, la coopération des administrations d'une part pour identifier les sources de ces émissions en employant tous les moyens disponibles, d'autre part pour obtenir la cessation de ces émissions.

BS RÉSOLUTION Nº 500

Relative à la modification des fréquences porteuses des stations de radiodiffusion à ondes kilométriques dans la Région 1

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il a intérêt, tant du point de vue technique qu'économique, à réduire les brouillages qui se produisent dans les récepteurs domestiques de radiodiffusion par suite de fréquences de combinaison;

---

(1) Remplace la Résolution Nº Aer2-2 de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978).

b) Que ces brouillages sont notablement réduits lorsque les valeurs nominales des fréquences porteuses des stations de radiodiffusion sont des multiples de l'écartement des canaux;
c) Que les valeurs nominales des fréquences porteuses des stations inscrites au Plan de radiodiffusion en ondes kilométriques pour la Région 1 (Génève, 1975) ne sont pas multiples de l'écartement des canaux (9 kHz);
d) Que, pour éviter des brouillages entre ces stations, il est nécessaire que les fréquences porteuses des stations de radiodiffusion à ondes kilométriques de la Région 1 soient modifiées à la même date, tout au moins pour toutes les stations qui utilisent en partage le même canal, sans en résulte une dominution de l'écartement entre les fréquences porteuses adjacentes;
e) Que la modification des fréquences porteuses des stations de radiodiffusion en ondes kilométriques augmentera, dans certains cas, les brouillages causés aux stations de radionavigation aéronautique;

notant

que le service de radionavigation aéronautique est un service de sécurité;

décide

1. Que, pendent la période allant du 1er février 1986 au 1er février 1990, les valeurs nominales des fréquences porteuses de toutes les stations à ondes kilométriques fonctionnant conformément à l'Accord de radiodiffusion à ondes kilométriques et hectométriques (Génève, 1975), ou projetées conformément aux dispositions de cet Accord, devront être réduites de 2 kHz, de manière que ces fréquences deviennent des multiples de 9 kHz, les autres caractéristiques des stations demeurant inchangées;

2. Que, afin de faire en sorte que toutes les dispositions puissent être prises pour éviter tout brouillage additionnel au service de radionavigation aéronautique, la modification des fréquences des stations de radiodiffusion devra se faire par groupes de cinq canaux adjacents, en commençant par le groupe ayant les fréquences les plus basses;

3. Que les modifications devront être opérées en trois étapes, à savoir:

Canaux 1 à 5 — le 1er février 1986
Canaux 6 à 10 — le 1er février 1988
Canaux 11 à 15 — le 1er février 1990 } à 1.00 UTC;

4. Que, à la date de la première modification (1er février 1986), la limite inférieure de la bande attribuée au service de radiodiffusion deviendra 148,5 kHz et que, après le 1er février 1990, la bande attribuée à ce service sera la bande 148,5-283,5 kHz;

5. Que toute modification d'une assignation de fréquence à une station de radionavigation aéronautique qui en résultera devra être notifiée à l'IFRB et, si son examen donne lieu à une conclusion favorable relativement aux dispositions des numéros **1240** et **1241**, elle devra être inscrite dans le Fichier de référence sans modification de date ou de statut. Si toutefois la conclusion du Comité n'est défavorable que relativement aux dispositions du numéro **1241**, la modification devra être inscrite dans le Fichier de référence conformément aux dispositions pertinentes de l'article 12, sans aucune modification de la date initiale;

décide en outre

que les administrations devront informer l'IFRB deux ans au moins avant d'apporter des modifications prévues aux caractéristiques de leurs stations de radiodiffusion existantes à ondes kilométriques, ou avant de mettre en service de nouvelles stations;

charfe l'IFRB

de publier ces renseignements dans une section spéciale de sa circulaire hebdomadaire;

charge le Secrétaire général

de communiquer la présent résolution au secrétaire général de l'OACI.

BU RÉSOLUTION Nº 501

Relative à l'examen par l'IFRB des fiches de notification concernant les stations du service de radiodiffusion de la Région 2 travaillant dans la bande 535-1605 kHz, au cours de la période précédant l'entrée en vigueur des Actes finals de la Conférence administrative régionale de radiodiffusion à ondes hectométriques (Région 2).

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'une Conférence administrative régionale de radiodiffusion à ondes hectométriques (Région 2) sera convoquée, en deux sessions, afin d'établir un plan pour la service de radiodiffusion dans la bande 535-1605 kHz;

b) Que la première session de cette Conférence aura lieu en mars 1980 et la seconde session en novembre 1981;
c) Que les dispositions pertinentes de l'article 12 ont été modifiées par la présente Conférence;
d) Que la Conférence administrative régionale de radiodiffusion à ondes hectométriques (Région 2) adoptera les dispositions que le Comité devra appliquer pour la notification et l'inscription dans le Fichier de référence des assignations de fréquence figurant dans le plan;
e) Qu'il est en conséquence nécessaire d'établir la procédure que la Comité devra appliquer pour l'examen des fiches de notification relatives aux stations de radiodiffusion de la Région 2 travaillant dans la bande 535-1605 kHz au cours de la période allant de la date d'entrée en vigueur des Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979), à la date d'entrée en vigueur des Actes finals de la Conférence administrative régionale de radiodiffusion à ondes hectométriques (Région 2);

décide

que, entre la date d'entrée en vigueur des Actes finals de la Conférence administrative mondiale des radiocommunications (Génève, 1979) et la date d'entrée en vigueur des Actes Finals de la Conférence administrative régionale de radiodiffusion à ondes hectométriques (Région 2), le Comité n'examinera pas, en ce qui concerne les dispositions du numéro **1241,** les fiches de notification des assignations de fréquence aux stations de radiodiffusion de la Région 2 travaillant dans la bande 535-1605 kHz et qu'il inscrira sans mention de date dans la colonne 2a ou dans la colonne 2b, la date figurant dans la colonne 2c n'étant donnée qu'à titre d'information.

DJ RÉSOLUTION Nº 502

Relative à le période comprise entre la date d'entrée en vigueur des Actes finals de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) et la date à laquelle les dispositions et le Plan associé adoptés par cette Conférence seront insérés en annexe au Règlement des radiocommunications (1).

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les Actes finals de la Conférence administrative mondiale des radiocommunications pour la radiofiffusion par satellite (Génève, 1977) sont entrés en vigueur le 1er janvier 1979;
b) Que la Résolution Nº Sat-4 de ladite Conférence demande à la Conférence administrative mondiale des radiocommunications de 1979 d'insérer les dispositions et le Plan associé qu'elle a établi en annexe au Règlement des radiocommunications;
c) Qu'une période intérimaire sépare l'entrée en viguer des Actes finals de la Conférence de 1977 et la mise en application du Règlement des radiocommunications comportant l'insertion des dispositions et du Plan associé de la Conférence de 1977 (appendice 30);

considérant en outre

que les Actes finals de la Conférence de 1977 sont considérés comme contenant un Accord mondial et un Plan associé, conformément à la Résolution Nº Spa 2-2 de la Conférence administrative mondiale des télécomunications spatiales (Généve, 1971);

décide

1. Que pendant cette période intérimaire, et après la date de leur insertion en annexe au Règlement des radiocommunications, les dispositions et le Plan associé conserveront leur intégrité en tant qu'instrument juridique;
2. Que pendant cette période l'IFRB et les autres organes concernés de l'UIT devront s'appuyer sur les dispositions des Actes finals de la Conférence de 1977 et du Règlement des radiocommunications.

BC RÉSOLUTION Nº 503

Relative à la coordenation, la notification et l'inscription dans le Fichier de référence international des fréquences, des assignations de fréquence aux stations du service de radiodiffusion par satellite de la Région 2 (2).

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

---

(1) Remplace la Résolution Nº Sat-3 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).
(2) Remplace la Résolution Nº Sat-5 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

considérant

a) Qu'un plan sera établi pour le service de radiodiffusion par satellite de la Région 2 conformément à la Résolution **701**;
b) Que, dans le Région 2, le service de radiodiffusion par satellite devrait être exploité conformément aux principes énoncés dans l'article 12 et les annexes 6 et 7 de l'appendice 30 du Règlement des radiocommunications;
c) Que certaines des dispositions adoptées par la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977), concernant les stations du service de radiodiffusion par satellite dans les Régions 1 et 3, peuvent également s'appliquer à la Région 2, jusqu'à l'entrée en vigueur du plan qui sera établi pour cette Région en vertu de la Résolution **701**;
d) Que, pendant la période intérimaire, les prócedures exposées dans la Résolution **33** continueront à être appliquées dans la Région 2;

décide

1. Qu'une administration désireuse de mettre en service une station spatiale de radiodiffusion par satellite dans la Région 2 devra, aux fins de la coordination avec les systèmes de radiocommunication spatiale des autres administrations, appliquer les dispositions appropriées de l'article 11 (numéros **1042** à **1056** inclus) du Règlement des radiocommunications;

2. Que les dispositions pertinentes de la Résolution **33** s'appliqueront à la coordination, la notification et l'inscription des assignations de fréquence aux stations de radiodiffusion par satellite dans la Région 2, chaque fois qu'une station du service de radiodiffusion par satellite ou du service fixe par satellite dans la Region 2 sera concernée;

2.1 Qu'une administration notifiant une assignation de fréquence à une station spatile du service de radiodiffusion par satellite dans la Région 2, aux termes du paragraphe 4.1 de la Résolution **33**, notifiera également une assignation de fréquence à une station terrienne de réception type;

3. Que les procédures de coordination, de notification et d'inscription pour les stations du service fixe par satellite qui sont décrites dans l'article 7 de l'appendice 30 au Règlement des radiocommunications seront appliquées également aux stations de radiodiffusion par satellite dans la Région 2, à l'égard des stations de radiodiffusion par satellite pour lesquelles une assignations de fréquence est conforme au Plan, dans tous le cas où:

La largeur de bande nécessaire de l'assignation de fréquence envisagée pour la Région 2 recouvre partiellement celle d'une assignation de fréquence de la Région 1 et ou de la Région 3; et
La puissance surfacique qui serait produite par l'assignation de fréquence envisagée pour une station spatiale de radiodiffusion de la Région 2 dépasse la valeur spécifiée dans l'annexe 1 de l'appendice 30;

4. Que, pour fournir les renseignements visés dans la section B de la Résolution **33** et dans la section II de l'article 7 de l'appendice 30, il conviendra d'utiliser l'annexe 2 de l'appendice 30;

5. Que chaque assignation de fréquence notifiée au titre du paragraphe 4.1 de la Résolution **33** ou du paragraphe 2.1 de la présente Résolution ou de la section III de l'article 7 de l'appendice 30 fera l'objet d'une fiche de notification distincte établie selon les dispositions de l'annexe 2 de l'appendice 30.

CK

RÉSOLUTION Nº 504

Relative aux Actes finals de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) en ce qui concerne la Région 2

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) a adopté seulement des dispositions intérimaires pour la Région 2;
b) Que la presente Conférence a décidé d'apporter au Tableau d'attribution des bandes de fréquences pour la Région 2 des modifications qui influent sur les conditions sur lesquelles sont fondées ces dispositions intérimaires des Actes final de la Conférence de 1977;
c) Que la présente Conférence a aussi décidé d'incorporer les dispositons et le Plan associé adoptés par la Conférence de 1977 dans le Règlement des radiocommunications en tant qu'appendice 30;
d) Qu'une conférence administrative régionale des radiocommunications se réunira en 1983 afin d'établir un plan pour le service de radiodiffusion par satellite dans la Région 2, conformément à la Résolution **701**;

décide

1. Que les dispositions de l'article 12 de l'appendice 30 relatives à la segmentation de l'arc dans la Région 2 ne sont plus applicables dans la bande 11,7-12,1 GHz et qu'elles ne le seront plus dans le reste de la bande 11,7-12,2 GHz à la suite de la Conférence administrative régionale des radiocommunications de 1983;

2. Que les autres dispositions intérimaires de l'appendice 30 concernant uniquement la Région 2 continueront à s'appliquer en attendant les décisions de la Conférence administrative régionale des radiocommunications de 1983. Après cette date, les Actes finals de la Conférence régionale de 1983 seront considérés comme annulant les dispositions intérimaires intéressant la Région 2 et actuellement contenues dans l'appendice 30, sous réserve d'avoir été officiellement adoptés par la prochaine Conférence administrative mondiale des radiocommunications compétente.

CM

RÉSOLUTION Nº 505

Relative au service de radiodiffusion par satellite (radiodiffusion sonore) dans la gamme de fréquences de 0,5 GHz à 2 GHz

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le plusieurs administrations ont présenté des propositions concernant des attributions de bandes de fréquences au service de radiodiffusion par satellite (radiodiffusion sonore) dans la gamme 0,5-2 GHZ;
b) Que les bandes de fréquences actuellement attribuées au service de radiodiffusion par satellite ne permettent pas la réception individuelle de programmes sonores par des récepteurs portatifs et par des récepteurs installés à bord des automobiles;
c) Que l'introduction du service de radiodiffusion par satellite (radiodiffusion sonore) dans la gamme 0,5-2 GHz est techniquement réalisable et permettrait la réception individuelle par des récepteurs portatifs et par des récepteurs installés à bord des automobiles;
d) Que des expériences de simulation ont confirmé certaines des hypothèses avancées dans des études théoriques, mais cependant, aucune démonstration d'un système pratique n'as encore été fatite;
e) Que des études complémentaires doivent être faites avant la mise en œuvre de systemes opérationnels;
f) Que le CCIR a entrepris des études sur ce service, dans le cadre du Programme d'études 34B/10;
g) Que la gamme de fréquences convenant à ce service est limitée à 0,5 GHz pour l'extrémité inférieure (en raison de l'élévation du niveau du bruit artificiel et de l'argumentation des dimensions des antennes d'émission lorsque la fréquence décroît) et à 2 GHz pour l'extrémité supérieure (en raison de la diminution de la surface équivalente des antennes de réception lorsque la fréquence augmente);
h) Que, en raison du niveau élevé de la puissance surfacique nécessaire, le partage avec les services de Terre semble extrêmement difficile;

notant

a) Que les certaines administrations ont présenté des propositions concernant la bande de fréquences 1429-1525 MHz;
b) Que le service de radioastronomie dispose d'une attribution dans la bande inférieure avoisinante, de sorte que la partie inférieure de la bande 1429-1525 MHz ne peut pass ête envisagée pour attribution au service de radiodiffusion par satellite (radiodiffusion sonore);
c) Que, dans la phase expérimentale, il suffirait d'une largeur de bande de quelques centaines de kilohertz;

décide

1. Que les administrations devront être encouragées à faire des expériences sur le service de radiodiffusion par satellite (radiodiffusion sonore) à l'intérieur de la gamme de fréquences 0,5-2 GHz, dans de petites sous-bandes convenablement situées, sous réserve d'accord entre les administrations concernées. Une de ces sous-bandes peut se situer dans la bande 1429-1525 MHz;

2. Que le CCIR devra poursuivre et accélérer les études relatives aux caractéristiques techniques d'un système de radiodiffusion sonore par satellite pour la réception individuelle sur des récepteurs portatifs et sur des récepteurs pour véhicules automobiles, à la faisabilité du partage avec les services de Terre et aux critères de partage appropriés;

3. Que la prochaine Conférence administrative mondiale des radiocommunications devant traiter des services de radiocommunication spatiale en général, ou d'un de ces services en particulier, devra être habilitée à examiner les résultats des diverses études effectuées et à prendre les décisions voulues concernant l'attribution d'une bande de fréquences appropriées;

4. Que la Conférence susmentionnée devra en outre mettre au point des procédures appropriées visant à protéger et, les cas échéant, à transférer dans d'autres bandes, les assignations aux stations des services de Terre qui pourraient être affectés.

AP RÉSOLUTION Nº 506

Relative à l'utilisation de l'orbite des satellites géostationnaires à l'exclusion de toute autre orbite, par les stations spatiales fonctionnant dans les bandes de fréquences des 12 GHz attribuées su service de radiodiffusion par satellite (1).

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) a approuvé, pour les Régions 1 et 3, um Plan spécifiant des assignations de fréquence dans les bandes mentionnées ci-dessus et des positions sur l'orbite des satellites géostationnaires;
b) Qu'une conférence régionale des radiocommunications qui se tiendra en 1983, doit élaborer un plan similaire pour la Région 2;
c) Que l'exploitation des services de radiocommunication spatiale dans lesdites bandes de fréquences, mais sur une orbite différente de celle des satellites géostationanaires, serait incompatible avec les plans mentionnées aux paragraphes *a*) et *b*);

décide

que les administrations doivent faire en sorte que leurs stations spatiales dans les bandes de fréquences considérées utilisent l'orbite géostationnaires, à l'exclusion de toute autre orbite.

AU RÉSOLUTION Nº 507

Relative à l'établissement d'accords et de plans associés pour le service de radiodiffusion par satellite (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il est important de faire le meilleur usage possible de l'orbite des satellites géostationnaires et des bandes de fréquences attribuées au service de radiodiffusion par satellite;
b) Que le grand nombre d'installations de réception, utilisant des antennes directives, qui pourront être mises en place pour un service de radiodiffusion par satellite pourra être un obstacle au changement des emplacements des stations spatiales de ce service sur l'orbite des satellites géostationnaires à partir du moment où elles seront mises en service;
c) Que les émissions de radiodiffusion par satellite pourraient créer des brouillages nuisibles sur une grande partie de la surface de la Terre;
d) Que les autres services bénéficiant d'attributions dans la même bande ont desoin d'utiliser celle-ci avant la mise en œuver du service de radiodiffusion par satellite;

décide

1. Que les stations du service de radiodiffusion par satellite seron établies et exploitées conformément à des accords et des plans associés établis par des conférences administratives, mondiales ou régionales selon le cas, auxquelles pourront participer toutes les administrations intéressées et celles dont les services ont susceptibles d'être affectés;

2. Que, pendent la période précédant l'entrée en vigueur de tels accords et plans associées, les administrations et l'IFRB appliquent la precédure décrite dans la Résolution 33;

invite le consiel d'administration

à poursuivre l'examen de la question de la convocation de conférences administratives mondiales ou de conférences administratives régionales s'il y a lieu, en vue de fixer les dates et lieux ainsi que l'ordre du jour convenables.

---

(1) Remplace la Résolution Nº Sat-7 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusions par satellite (Génève, 1977).

(2) Remplace la Résolution Nº Spa2-2 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

DI

RÉSOLUTION Nº 508

Relative à la convocation d'une conférence administrative mondiale des radiocommunications pour la planification des bandes d'ondes décamétriques attribuées au service de radiodiffusion

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la situation existant actuellement dans les bandes d'ondes décamétriques attribuées en exclusivité au service de radiodiffusion n'est pas satisfaisante;

b) Qu'il importe de faire en sorte que soient garantis à tous les pays des droits égaux de libre utilisation de ces bandes;

décide

1. Que l'utilisation des bandes d'ondes décamétriques attibuées en exclusivité ou en partege au service de radiodiffusion (à l'exclusion des bandes réservées á la radiodiffusion dans la Zone tropicale) fasse l'objet d'une planification par une conférence administrative mondiale des radiocommunications;

2. Que la planification soit fondée sur l'utilisation d'émissions à double bande latérale (DBL). La conférence devrait également étudier la manière selon laquelle un système à bande latérale unique (BLU) pourrait être introdiut progressivement sans dégrader des émissions à double bande latérale;

3. Que la conférence visée au paragraphe 1 comporte deux sessions;

4. Que la première session:

4.1. Soit chargée de spécifier les critères techniques pour la planification et les principes devant régir l'utilisation des bandes d'ondes décamétriques attrubués au service de radiodiffusion, en particulier:

4.1.1. La puissance appropriée pour la radiodiffusion à ondes décamétriques, compte tenu des autres facteurs techniques pertinents;

4.1.2. Les besoins de chaque pays en matière de radiodiffusions nationale et internationale;

4.1.3. Le nombre maximal de fréquences à utiliser pour la diffusion d'un même programme à destination d'une même zome;

4.1.4. La spécification d'un système à bande latérale unique pouvant être utilisé dans l'avenir pour la radiodiffussion à ondes décamétriques;

4.2. Décide en outres des principes de planification à appliquer et de la méthode de planification á utiliser par la deuxième session;

5. Que, à sa seconde, qui devrait se tenir au plus tôt 12 mois et au plustard 18 mois après la première session, la conférence:

5.1. Procède à la planification conformémente aux principes et à la méthode fixés lors de la première session;

5.2. Passe en revue et, si besoin est, révise les dispositions pertinentes du Règlement des radiocommunications relatives au service de radiodiffusion à ondes décamétriques;

demande instamment aux administrations

en attendant que la conférence se tienne, de ne pas utiliser des émetteurs d'une puissance plus élevée qu'il n'est besoin pour assurer une réception satisfaisante et de faire em sorte que le nombre de fréquences utilisées corresponde au minimun nécessaire;

attire l'attention du Conseil d'administration

sur l'urgence que revêt cette conférence, et

invite le Conseil d'adnisnistration

à prendre toutes les dispositions nécessaires pour la convocation de la conférence et à fixer la date de la première session le plus tôt possible après la prochaine Assemblée plénière du CCIR compte tenu du délai minimal fixé dans l'article 58 (numéro **303**) de la Convention;

prie l'IFRB

d'effectuer les études techniques et les travaux préparatoires nécessaires, y compris ceux visés au numéro **1771** du Règlement des radiocommunications;

prie le CCIR

d'accélérer les études faisante l'objet des Recommandations 500 et 501.

CQ

RÉSOLUTION Nº 509

Relative à la convocation d'une conférence régionale de radiodiffusion chargée de réexaminer et de réviser les dispositions des Actes finals de la Conférence africaine de radiodiffusion sur ondes métriques et décimétriques (Génève, 1963).

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le dernier Plan africain de radiodiffusion sur ondes métriques et décimétriques a été établi à Génève, en 1963, pour la radiodiffusion sonore dans la bande II (87,5-100 MHz) et pour la radiodiffusion télévisuelle dans les bandes I (47-68 MHz), III (174-233 MHz) et V (582-960 MHz);
b) Que certains pays africains n'ont pu participer à la Conférence africaine de radiodiffusion sur ondes métriques et décimétriques (Génève, 1963);
c) Que nombre d'autres pays africains sont, depuis lors, devenus indépendants et que ces pays devront être inclus dans un nouveau plan;

notant

a) Qu'il est prévu d'organiser une conférence de planification de la radiodiffusion sonore à modulation de fréquence pour la bande 87,5-108 MHz (voir Résolution **510**);
b) L'extension de 174-223 MHz, de l'attribution qui a été faite au service de radiodiffusion (télévision) à titre primaire dans la Région 1;

constantant

qu'il est nécessaire d'actualiser le Plain existant;

décide

qu'une conférence régionale sera convoquée aussitôt que possible, et de préference avant 1984, afin de réexamier et de réviser les dispositions du Plan actuel de radiodiffusion télévisuelle en ondes métriques et décimétriques (Génève, 1963) pour la Zone africaine de radiodiffusion, compte tenu des assignations contenues dans le Plan de Stockholm, 1961;

invite le Conseil d'administration

à prendre toutes les dispositions nécessaires pour convoquer cette conférence et pour en fixer la date et l'ordre du jour;

demande au CCIR

d'effectuer les études techniques nécessaires;

demande à l'IFRB

d'effecture les travaux préparatoires nécessaires à ladite conférence.

BM

RÉSOLUTION Nº 510

Relative à la convocation d'une conférence de planification de la radiodiffusion sonore dans la bande 87,5-108 MHz pour la Région 1 et certains pays concernés de la Région 3

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la bnde attribuée à titre primaire au service de radiodiffusion dans la Régions 1 a été élargie de 87,5-100 Mhz à 87,5-108 MHz;
b) Que dans la Région 1 la bande 100-108 MHz est actuellement attribuée au service mobile, sauf mobile aéronautique (R) et également au service fixe dans quelques pays;
c) Que plusieurs pays de la Région 3 ayant des frontiéres terrestres avec la Région 1 utilisent aussi cette bande pour le service de radiodiffusion;
d) Qu'il est nécessaire d'établir un nouveau plan de radiodiffusion sonore pour toute la bande 87,5-108 MHz, pour tous les pays de la Région 1 qui utilisent ou qui prévoient d'utiliser la bande 87,5-100 MHz pour la radiodiffusion sonore à modulation de fréquence;

e) Que, pour d'autres pays de la Régions 1, il y a lieu d'établir un plan de radiodiffusion sonore dans la bande 100-108 MHz;

f) Que ce nouveau plan ne devrait en aucun cas affecter les assignations existantes ou en projet, aux stations de télévision dans la bande 87,5-100 MHz, qui sont conformes à l'Accord régional de Stockholm, 1961;

g) Que ce nouveau plan, dans la bande 87,5-100 MHz, ne devrait pas avoir pour conséquence de détérioration des zones de service de stations existantes de radiodiffusion sonore fonctionnantt conformémente à l'Accord régional de Stockholm, 1961, situées dans la zone de coordination avec les pays utilisant cette bande pour la télévision conformément à l'Accord régional de Stockholm, 1961;

h) Qu'il est nécessaire d'introduire dès que possible des stations de radiodiffusion sonore dans la bande 100-108 MHz conformément à ce plan;

i) Qu'il est possible que les installations de radionavigation utilisées pour l'atterrissage automatique des aéronefs et fonctionnante dans la bande adjacente 108-112 MHz soient soumises à des brouillages préjudiciables par des stations de radiodiffusion situées à proximité et fonctionnant dans la bande 87,5-108 MHz, si les fréquences des stations respectives ne sont pas judicieusement choisies, et que de tels brouillages mettent en danger la vie humaine;

décide

1. Qu'une conférence régionale se tiendra avant le 31 décembre 1983 en vue d'établir um accord pour la Région 1 et les pays concernés de la Région 3 et un plan associé relatif á la radiodiffusion sonore dans la vande 87,5-108 MHz pour la Régions 1 et les parties de l'Afghanistan et de l'Iran contiguês à la Région 1.

2. Que cette conférence sera scindée en deux sessions:

La première session permattra d'établir les bases techniques pour la preéparation du plan, les critères mutuels de partage enter le service de radiodiffusion sonore et les autres services, y compris le service de radiodiffusion (télévision) foncionnant dans la bande 87,5-108 MHz;

La seconde session, que si tiendra se préférance six à douze mois après la première, devra élaborer l'accord et le plan associé;

3. Que l'on doit donner aux pays concernés de la Région 3 la possibilité de participer à cette conférence;

prie le CCIR

d'étudier l'urgence les bases techniques nécessaires à la planfication et à la détermination des critères de protection entre les stations de radiodiffusion sonore et les stations de radiodiffusion télévisuelle et entre les stations de radiodiffusion sonore et les stations des services fixe et mobile, sauf mobile aéronautique (R);

invite le Conseil d'adimistration

à fixer les dates et l'orde du jour de cette conférence;

demande aux administrations

de tenir compte, lors de la planification de la bande 87,5-108 MHz, des problèmes de compatibilité avec les installations de radionavigation fonctionnant dans la bande adjacente.

CO

RÉSOLUTION Nº 600

Relative à l'utilisation pour le service de radionavigation, des bandes de fréquences 2900-3100 MHz, 5470-5660 MHz, 9200-9300 MHz et 9500-9800 MHz

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la présente Conférence a adopté des dispositions relatives à la mise au point de répondeurs devant être installés à bord de navires et utilisés dans le service de radionavigation maritime, dans les bandes de fréquences 2930-2950 MHz, 5470-5480 MHz et 9280-9300 MHz;

b) Que des attributions de fréquence pour le service de radionavigation, dans les bandes utilisées pour la radionavigation aéronautique et maritime, font déjà l'objet de demandes accrues, en raison:

i) De l'accroissement du nombre de radiodétecteurs maritimes de bord, accroissement qui est appelé à s'intensifier du fait de l'exigence visant á rendre obligatoire l'instalation de ces équipements à bord des navires dans le monde entier;

ii) Des besoins accrus en matière d'auxiliaires de la navigation et de répondeurs appelés à fonctionner en association avec des radiodètecteurs primaires;

iii) De la nécessité d'accroître l'utilisation de cette bande para les stations du service de radionavigation aéronautique, compte tenu du fait que l'on exige aussi l'instalation de ces équipaments à bord d'áeronefs à tire obligatoire dans le monde entier;

c) Que des brouillages préjudiciables de produisent de plus en plus la bande 9300-9500 MHz en raisom de ces circonstances;
d) Que de telles applications des radiodétecteurs soulèvent d'importants problèmes de sécurité;

notant

a) Les dispositions de la Recommandation 605;
b) Les conclusions de la Réunion spéciale préparatoire du CCIR;
c) Le nécessité de disposer de renseignements complémentaires, concernant l'exploitation et les aspects techniques, pour décider de l'utilisation la plus efficace des fréquences;

décide

1. Que la prochaine conférence administrative mondiale des radiocommunications compétente devra:
1.1. Réexaminer les renvois relatifs à ces bandes attribuées au service de radionavigation et y apporter les modifications qu'elle jugera appropriées, à la lumière d'études complémentaires;
1.2. Élaborer des recommandations appropriées à caractère réglementaire;
2. Que le CCIR devra poursuivre l'examen des aspects techniques et formuler des Avis;

invite

1. Le Conseil d'administration á faire en sorte que les questions de radionavigation intéressant les services mobiles figurent à l'ordre du jour de la prochaine conférence de radiocommunications compétente en matière de services mobiles;
2. Les administrations à étudier l'utilisation de ces bandes par les services de radionavigation et à soumettre des propositions en vue de l'utilisation efficace desdites bandes;

prie le Secrétaire général

de soumettre la présente Résolution à l'OMCI et à l'OACI, et de demander à ces organisations d'examiner d'urgence les exigences opérationnelles des services de radionavigation maritime et aéronautique qui utilisent ces bandes de fréquences et de formuler des recommandation appropriées afin d'aider les administrations à préparer cette conférence.

AL

RÉSOLUTION N° 601

Relative aux Normes et aux Avis concernant les radiobalises de localisation des sinistres fonctionnant sur les fréquences 121,5 MHz et 243 MHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les radiobalises de localisation des sinistres qui fonctionnent sur les fréquences 121,5 MHz et 243 MHz sont destinées à faciliter les óperations de recherche et de sauvetage;
b) Que les fréquences 121,5 MHz et 243 MHz sont couramment utilisées par les aéronefs qui participent a des opérations de recherche et de sauvetage;
c) Que l'Organisation de l'aviation civile internationale a recommandé des caractéristiques du signal et des spécifications techniques applicables aux appareils d'aéronef qui fonctionnent sur la fréquence 121,5 MHz ou sur la fréquence 243 MHz, ou sur ces deux fréquences;

décide

qu'il convient que les administrations qui autorisent l'utilisation de radiobalises de localisation des sinistres qui fonctionnent sur la fréquence 121,5 MHz ou sur la fréquence 243 MHz, ou sur ces deux fréquences, fassent en sorte que ces radiobalises soient conformes aux Normes et aux Avis pertinents de l'Organisation de l'aviation civile internationale et du Comité consultatif international des radiocommunications.

---

(1) Remplace la Résolution N° Mar7 de la Conférence administrative mondiale des radiocommunications (Génève, 1967).

BN

RÉSOLUTION N° 640

Relative à l'utilisation internationale, en cas de catastrophe naturelle, des radiocommunications dans les bandes de fréquences attribuées au service d'amateur

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'en cas de catastrophe naturelle, les systèmes de communication normaux sont fréquemment surchargés, endommagés ou totalement inutilisables;

b) Qu'il est indispensable de rétablir rapidement les communications pour faciliter les opérations de secours organisées à l'échelle mondiale;

c) Que les bandes attribuées au service d'amateur ne sont pas soumises à des plans internationaux ou à des procédures de notification et qu'elles se prêtent donc bien à une utilisation à court terme dans le cas d'urgence;

d) Que les communications internationales en cas de catastrophe seraient facilitées par le recours provisoire à certaines bandes de fréquences attribuées au service d'amateur;

e) Que, dans de telles circonstances, les stations du service d'amateur, en raison de leur large dispersion et de leur capacité démontrée dans des cas semblables, peuvent aider à répondre aux besoins essentiels en communications;

f) Qu'il existe des réseaux nationaux et régionaux d'amateur, pour les cas d'urgence, qui utilisent certaines fréquences dans les bandes attribuées au service d'amateur;

g) Qu'en cas de catastrophe naturelles, la communication directe entre les stations du service d'amateur et d'autres stations pourrait se révéler utile, notamment pour effectuer des communications indespensables jusqu'au rétablissement des communications normales;

reconnaissant

que les droits et les responsabilités en matière de communications en cas de catastrophe naturelle relévent des administrations concernées;

décide

1. Que les bandes attribuées au service d'amateur, spécifiées au numéro **510,** peuvent être utilisées par les administrations pour répondre aux besoins de communications internationales en cas de catastrophe;

2. Que ces bandes ainsi utilisées ne doivent servir qu'à des communications se rapportant à des opérations de secours en cas de catastrophe naturelle;

3. Que, pour les communications en cas de catastrophe, l'utilisation des bandes attribuées au service d'amateur par des stations n'appartenant pas à ce service doit être limitée à la période d'urgence et aux zones géographiques particulières, définies par l'autorité responsable du pays affecté;

4. Que les communications établies en cas de catastrophe doivent être effectuées à l'intérieur de la zone sinistrée et entre la zone sinistrée et le siège permanent de l'organisation assurant les opérations de secours;

5. Que de telles communications ne doivent être effectuées qu'avec le consentement de l'administration du pays frappé par la catastrophe;

6. Que les communications de secours d'origine extérieure au pays sinistré ne doivent pas remplacer les réseaux d'amateur nationaux ou internationaux déjà prévus pour les situations d'urgence;

7. Qu'une étroite collaboration est souhaitable entre les stations du service d'amateur et les stations d'autres services de radiocommunication qui pourraient estimer nécessaire d'utiliser les fréquences attribuées au service d'amateur pour les communications en cas de catastrophe;

8. Que de telles communications internationales de secours doivent être, dans la mesure du possible éviter de causer des brouillages aux réseaux du service d'amateur;

invite les administrations

1. À satisfaire aux besoins pour les communications internationales en cas de catastrophe;

2. À prévoir, dans leur réglementation nationale, les moyens de satisfaire aux besoins pour les communications d'urgence.

CR

RÉSOLUTION N° 641

Relative à l'utilisation de la bande de fréquences 7000-7100 kHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

---

(1) Remplace la Résolution N° 10 de la Conférence administrative des radiocommunications (Génève, 1959).

considérant

a) Que le partage des bandes de fréquences entre le service d'amateur et le service de radiodiffusion n'est pas souhaitable et qu'il convient de l'éviter;
b) Qu'il est souhaitable que ces services reçoivent, dans la bande 7, des attributions mondiales exclusives;
c) Que la bande 7000-7100 kHz est attribuée en exclusivité au service d'amateur dans le monde entier;

décide

que la bande 7000-7100 kHz doit être interdite au service de radiodiffusion et que les stations de radiodiffusion doivent cesser d'émettre sur des fréquences de cette bande.

BV RÉSOLUTION N° 642

Relative à la mise en service des stations terriennes du service d'amateur par satellite

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

reconnaissant

que les procédures des articles **11** et **13** sont applicables au service d'amateur par satellite;

reconnaissant en outre

a) Que les caractéristiques des stations terriennes du service d'amateur par satellite sont très diverses;
b) Que les stations spatiales du service d'amateur par satellite sont conçues pour que les stations terriennes d'amateur de tous les pays y aient accès;
c) Que la coordination entre les stations des services d'amateur et d'amateur par satellite s'effectue sans qu'il soit besoin de recourir à des procédures officielles;
d) Qu'il incombe à l'administration qui autorise une station spatiale du service d'amateur par satellite de mettre fin à tout brouillage préjudiciable, en application des dispositions du numéro **2741** du Règlement des radiocommunications;

note

que certains renseignements spécifiés dans les appendices 3 et 4 ne peuvent raisonnablement être fournis pour des stations terriennes du service d'amateur par satellite;

décide

1. Que lorsqu'une administration (ou une administration agissant au nom d'un groupe d'administrations nommément désignées) se propose d'établir un système à satellites du service d'amateur par satelllite et souhaite publier des renseignements relatifs aux stations terriennes de ce système, elle pourra:

1.1. Communiquer à l'IFRB la totalité, ou une partie, des renseignements demandés dans l'appendice 3; l'IFRB publiera ces renseignements dans une section spéciale de sa circulaire hebdomadaire en demandant que des commentaires lui soient communiqués dans un délai de quatre mois à partir de la date de publication;

1.2. Notifier, aux termes des numéros **1488** à **1491**, la totalité ou une partie des renseignements énumérés dans l'appendice 3; l'IFRB les inscrira dans une liste spéciale;

2. Que ces renseignements comprendront au minimum les caractéristiques d'une station terrienne type du service d'amateur par satellite, pouvant transmettre des signaux à la station spatiale pour déclencher ou modifier les fonctions de la station spatiale ou pour y mettre fin.

CJ RÉSOLUTION N° 700

Relative au partage entre le service fixe par satellite dans les Régions 1 et 3 et le service de radiodiffusion par satellite dans la Région 2 dans la bande 12,2-12,7 GHz

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

reconnaissant

a) Qu'elle a fait une attribution au service de radiodiffusion par satellite dans la bande 12,1-12,7 GHz dans la Région 2;
b) Que l'attribution au service fixe par satellite a été maintenue dans la bande 12,5-12,75 GHz, dans les Régions 1 et 3, et qu'une attribution additionnelle a été faite dans la bande 12,2-12,5 GHz pour la Région 3;

c) Que, lors de l'établissement du Plan de radiodiffusion par satellite (Génève, 1977) pour les Régions 1 et 3, il a été dûment tenu compte des besoins d'exploitation futurs du service fixe par satellite dans la Région 2 et que, à cet effet, il a été nécessaire d'imposer des restrictions pour la préparation du Plan et la procédure de modification associée;

décide

1. Que, avant l'entrée en vigueur des dispositions appropriées et du plan associé que doit établir la conférence régionale pour la planification du service de radiodiffusion par satellite dans la Région 2, les dispositions de la Résolution 33 ainsi que les dispositions de l'article 11 s'appliqueront à la coordination entre les stations spatiales du service de radiodiffusion par satellite de la Région 2 et les stations spatiales du service fixe par satellite des Régions 1 et 3;

2. Qu'en établissant un plan (ainsi que toute procédure de modification associée) pour le service de radiodiffusion par satellite dans la Région 2, on devra tenir compte de la nécessité d'un fonctionnement satisfaisant, dans l'avenir, du service fixe par satellite dans les Régions 1 et 3, et que si l'on juge nécessaire d'imposer des contraintes á ce service, en sorte qu'aucun brouillage préjudiciable ne soit causé aux services fixes par satellite ou de radiodiffusion par satellite en question, il conviendra que ces contraintes ne soient en aucun cas plus strictes que celles imposées au service fixe par satellite dans la Région 2 par l'appendice 30;

3. Que, pour indiquer à la conférence régionale les principes directeurs à suivre pour atteindre l'objectif énoncé au point 2 ci-dessus, le CCIR devra étudier d'urgence les dispositions techniques requises, en tenant compte des systèmes existants ou projetés du service fixe par satellite pour l'exploitation dans la bande 12,5-12,7 GHz, dans la Région 1 et 12,2-12,7 GHz dans la Région 3.

CH

RÉSOLUTION N° 701

Relative à la convocation d'une conférence administrative régionale des radiocommunications chargée d'établir un plan détaillé pour le service de radiodiffusion par satellite dans la bande des 12 GHz et les liaisons de connexion associées dans la Région 2 (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

notant

a) Que la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) a adopté un Plan d'assignations de fréquence et de positions orbitales pour le service de radiodiffusion par satellite dans la bande des 12 GHz, pour les Régions 1 et 3;

b) Que ladite Conférence a adopté des dispositions intérimaires, en atendant l'établissement d'un plan analogue pour la Région 2;

c) Que, à la suite d'une consultation des Membres de la Région 2 par le Conseil d'administration, on prévoit la convocation, en 1983, d'une conférence administrative régionale des radiocommunications pour la radiodiffusion par satellite pour la Région 2;

d) Que la présente Conférence a adopté des modifications du Tableau d'attribution des bandes de fréquences, qui auront de sérieuses répercussions sur les conditions sur lesquelles la Conférence de la Région 2 se fondera pour établir son plan pour le service de radiodiffusion par satellite dans la bande des 12 GHz;

e) Que la présente Conférence a aussi décidé d'incorporer les dispositions et le Plan associé adoptés par la Conférence de 1977 dans le Règlement des radiocommunications en tant qu'appendice 30;

considérant

a) Que les annexes 8 et 9 de l'appendice 30 contiennent les données techniques et les critères de partage utilisés pour l'établissement des dispositions et du Plan associé;

b) Qu'il convient de tirer parti des progrés techniques découlant des expériences effectuées avec des satellites de radiodiffusion depuis 1977;

c) Qu'il convient aussi de tirer parti des études récentes du CCIR;

d) Que, en ce qui concerne les services de radiocommunication spatiale, la présente Conférence a attribué, dans la Région 1, la bande 12,3-12,7 GHz au service de radiodiffusion par satellite et la bande 12,1–12,3 GHz au service fixe par satellite et au service de radiodiffusion par satellite, conformément aux dispositions du renvoi **841** du Tableau d'attribution des bandes des fréquences;

e) Que la présente Conférence a désigné les bandes 14,5-14,8 GHz et 17,3-18,1 GHz pour être utilisées sur les liaisons de connexion vers les satellites de radiodiffusion;

f) Qu'il y a de sérieux avantages á planifier les liaisons montantes en même temps qu'on effectue la planification des systèmes de radiodiffusion par satellite fonctionnant dans la bande des 12 GHz;

---

(1) Remplace les Résolutions N° Sat–8 et N.° Sat–9 et la Recommandation Sat–8 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

reconnaissant

a) Qu'une segmentation de l'arc n'est plus nécessaire dans la bande 11,7-12,1 GHz et ne sera plus nécessaire dans la bande 12,1-12,3 GHz á la suite de la Conférence administrative régionale des radiocommunications de 1983;

b) Que les systèmes du service fixe par satellite fonctionnant dans la bande 11,7-12,2 GHz ne doivent pas imposer de restrictions à l'établissement d'un plan de radiodiffusion par satellite dans la Région 2, mais qu'il conviendra de prendre en considération dans les décisions de la conférence administrative régionale des radiocommunications de 1983, ceux d'entre eux qui seront développés jusqu'à la date de la conférence administrative régionale des radiocommunications de 1983, et qui seront conformes aux dispositions des Actes finals de la Conférence administrative mondiale des télécomunications spatiales (Génève, 1971) et de la Conférence Administrative Mondiale des Radiocommunications pour la radiodiffusion par satellite (Génève, 1977);

décide

1. Qu'une Conférence administrative régionale des radiocommunications (CARR) à laquelle se réfère *notant c)* se tiendra au plus tard en 1983, afin de:

1.1. Diviser la bande 12,1-12,3 GHz en deux sous-bandes et d'attribuer, à titre primaire, la sous-bande inférieure au service fixe par satellite et la sous-bande supérieure au service de radiodiffusion par satellite, au service de radiodiffusion, au service mobile, sauf mobile aéronautique, et au service fixe (voir le numéro **841**);

1.2. Établir un plan détaillé d'assignations de fréquence et de positions orbitales pour le service de radiodiffusion par satellite dans la Région 2, dans la bandes 12,3-12,7 GHz et dans la portion de la bande 12,1-12,3 GHz qu'elle attribuera au service de radiodiffusion par satellite;

1.3. Planifier les liaisons de connexion dans une partie de la bande 17,3-18,1 GHz, de même largeur que la bande totale attribuée au service de radiodiffusion par satellite dans la bande des 12 GHz. Toutefois, les administrations pourront, pour les liaisons de connexion vers les satellites de radiodiffusion, utiliser des bandes de fréquence autres que les bandes prévues dans le plan, à condition que cette utilisation ne nécessite aucune modification du plan;

1.4. Établir des procédures qui réglement l'utilisation, par le service de radiodiffusion par satellite, des bandes spécificiés au paragraphe 1.2 de la présente Résolution et, si nécessaire, des procédures applicables aux liaisons de connexion correspondantes;

2. Que la planification devra tenir compte des sections pertinentes de l'appendice 30, et en particulier des annexes 4 et 5, ainsi que d'autres décisions prises par la présente Conférence. En prenant en considération les annexes 6, 7 et 8, il conviendra également de tenir compte des Avis les plus récents du CCIR et des derniers progrès de la technique;

3. Que le plan précisera l'assignation détailée des positions orbitales et des canaux disponibles, garantissant ainsi que les besoins en matière de radiodiffusion par satellite présentés par chaque administration seront satisfaits de façon équitable pour tous les pays intéressés. Il connviendra de garantir, par principe, à chaque administration de la Région, um nombre minimal (4) de canaux pour l'exploitation du service de radiodiffusion par satellite. Au-delà de ce minimum, on tiendra compte des caractéristiques particulières des pays (superficie, zones horaires, diversité linguistique, etc);

4. Que toutes les administrations dela Région 2 devront présenter à l'IFRB leurs besoins en ce qui concerne le service de radiodiffusion par satellite au plus tard un an avant le début de la Conférence administrative régionale des radiocommunications chargée d'établir un plan pour ce service dans la Région 2. Ces besoins pourront être mis à jour au gré des administrations. On considère que le mot «besoin» inclut le nombre et les limites de chaque zone de service ainsi que le nombre de canaux nécessaires pour chaque zone. Six mois avant la date limite fixée pour envoyer les demandes, l'IFRB rappellera aux administrations, par lettre-circulaire ou télégramme, qu'elles sont dans l'obligation de faire connaître leurs besoins;

5. Que la planification se fera sur la base de la réception individuelle, mais que chaque administration pourra utiliser le système de réception qui répond le mieux à ses besoins (réception individuelle ou réception communautaire, ou les deux);

6. Que, lors de la planification, on ne devra pas perdre de vue que les systèmes doivent être conçus de manière à réduire au minimum les diférences et incompatibilités techniques avec les systèmes utilisés dans d'autres Régions;

7. Que la planification devrait tenir compte des dispositions des Résolutions **31** et **700** relatives à la question du partage interrégional;

invite le Conseil d'administration

à prendre les mesures nécessaires pour la convocation de ladite conférence administrative régionale des radiocommunications, en se fondant sur les dispositions de la présente Résolution pour en établir l'ordre du jour;

invite le CCIR

à effectuer les études nécessaires pour présenter em temps utile des renseignements techniques dont la conférence aura probablement besoin comme base de ses travaux (voir aussi la Recommandation 101);

invite l'IFRB

1. À demander à toutes les administrations des pays de la Région 2 de présenter leurs besoins en matière de service de radiodiffusion par satellite conformément aux dispositions du paragraphe 4 ci-dessus;

2. À rassembler les renseignements présentés par les administrations sous une forme permettant d'en faire une étude comparative, à communiquer ces renseignements au Secrétaire général pour publication et à les envoyer aux administrations au plus tard neuf mois avant l'ouverture de la conférence administrative régionale des radiocommunications.

DK RÉSOLUTION N° 702

Relative à la convocation d'une conférence administrative régionale des radiocommunications chargée de définir des critères de partage pour l'utilisation des bandes des ondes métriques et décimétriques attribuées aux services fixe, de radiodiffusion et mobile dans la Région 3.

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les attributions de fréquences dans les bandes des ondes métriques et décimétriques ont subi pendant cette Conférence d'importantes révisions occasionnant des partages essentiellement entre les services fixe, de radiodiffusion et mobile;
b) Que le développement anarchique des services, qui partagent cette portion du spectre dans toute la Région, risque d'entraîner une utilisation désordonnée et inefficace de ce dernier;
c) Qu'aucun critère bien établi ne définit le partage du spectre entre les services auxquels ces bandes sont attribuées;
d) Que, dans la Région 3, nul arrangement régional ne régit l'installation de stations de radiodiffusion dans ces bandes;
e) Qu'il n'est pas certain, à ce stade, qu'un plan d'assignation soit nécessaire pour la Région 3;

notant

la priorité qu'elle a donnée à la convocation de futures conférences administratives des radiocommunications;

décide

1. Qu'une conférence administrative régionale des radiocommunications soit convoquée en temps voulu;
2. Que cette conférence régionale définisse les critères techniques de partage entre les services fixe, de radiodiffusion et mobile auxquels les bandes en cause sont attribuées;
3. Que, après définition de ces critères techniques, la conférence décide également des mesures à prendre par la suite;

invite le Conseil d'administration

à préparer la convocation de ladite conférence administrative régionale des radiocommunications en s'appuyant sur les indications données dans la présente Résolution pour établir l'ordre du jour de la conférence;

invite le CCIR

à mener les études nécessaires pour présenter, en temps voulu, les informations techniques vraisemblablement nécessaires pour servir de base aux travaux de la conférence régionale;

invite les administrations

à contribuer de manière appropriée aux études du CCIR.

CW RÉSOLUTION N° 703

Relative aux méthodes de calcul et aux critères de brouillage recommandés par le CCIR en ce qui concerne le partage des bandes de fréquences entre services de radiocommunication spatiale et services de radiocommunication de Terre ou entre services de radiocommunication spatiale (1).

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que, dans les bandes de fréquences utilisés en partage, avec égalité des droits, par les services de radiocommunications spatiale et les services de radiocommunication de Terre, il faut imposer à chacun de ces services certaines restrictions d'ordre technique et certaines procédures de coordination afin de limiter les brouillages mutuels;

(1) Remplace la Résolution Spa-6 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

b) Que, dans les bandes de fréquences utilisées en partage par des stations spatiales situées à bord de satellites géostationnaires, il faut imposer des procédures de coordination afin de limiter les brouillages mutuels;
c) Que les méthodes de calcul et les critères de brouillage se rapportant aux procédures de coordination mentionnées aux paragraphes *a*) et *b*) ci-dessus, sont fondés sur des Avis du CCIR;
d) Que, en raison d'une part des heureux résultats de l'utilisation partagée des bandes de fréquences par les services de radiocommunication spatiale et les services de radiocommunication de Terre, d'autre part des progrès constants de la technique spatiale, chaque Assemblée plénière du CCIR qui s'est depuis la X[e] Assemblée plénière (Génève, 1963) a amélioré certains des critères techniques que l'Assemblée plénière précédente avait préconisés;
e) Que l'Assemblée plénière du CCIR se réunit tous les trois ans alors que les conférences administratives des radiocommunications qui sont habilitées à modifier le Règlement des radiocommunications en tirant largement parti des Avis du CCIR se tiennent, en pratique, moins fréquemment et beaucoup moins régulièrement;
f) Que la Convention internationale des télécommunications (Malaga-Torremolinos, 1973) reconnaît aux Membres de l'Union la faculté de conclure des accords particuliers sur des questions de télécomunications; toutefois, ces accords ne doivent pas aller à l'encontre des dispositions de la Convention ou des Règlements y annexés en ce qui concerne les brouillages préjudiciables causés aux services de radiocommunications des autres pays;

convaincre

a) Que les Assemblées plénières du CCIR qui se tiendront à l'avenir, apporteront vraisemblablement de nouvelles modifications aux méthodes de calcul et critères de brouillage recommandés;
b) Que les administrations devraient être informées à l'avance des projets d'Avis pertinents du CCIR;
c) Qu'il est souhaitable que les administrations appliquent, dans la mesure du possible, les Avis en vigueur du CCIR relatifs aux critères de partage, lorsqu'elles établissent des plans de système destinés à fonctionner dans les bandes de fréquences partagées, avec égalité des droits, entre services de radiocommunication spatiale et services de radiocommunication de Terre ou entre services de radiocommunication spatiale;

invite le CCIR

a) À demander aux comissions d'études de préparar, lors de leurs réunions finales précédant l'Assemblée plénière, une liste provisoire signalant les passages pertinents des projets d'Avis révisés et des projets de nouveaux Avis du CCIR qui ont une incidence sur les méthodes de calcul et les critères de brouillage, ainsi que les sections spécifiques du Règlement des radiocommunications auxquelles ils s'appliquent, pour ce qui est du partage entre services de radiocommunication spatiale et services de radiocommunication de Terre, ou entre services de radiocommunication spatiale;
b) À demander au Directeur du CCIR de faire parvenir cette liste aux administrations et à l'IFRB accompagnée des textes de ces projets d'Avis révisés et de nouveaux Avis dans le délai de trente jours qui suit les réunions finales des commissions d'études;

décide

1. Que l'IFRB diffusera immédiatement à toutes les administrations les renseignements mentionnés au paragraphe *b*) du point *invite* du dispositif, de telle manière que ces renseignements leur parviennent dès que possible avant la convocation de l'Assemblée plénière suivante.

Cet envoi devra être accompagné d'une note indiquant que les textes joints sont soumis à l'approbation de l'Assemblée plénière suivante du CCIR;

2. *a*) Que chaque Assemblée plénière du CCIR, après avoir adopté tout ou partie des Avis pertinents, examiné et approuvé les parties appropriées de la liste mentionnée au paragraphe *a*) du point *invite* du dispositif, prendra les dispositions nécessaires pour que le Secrétaire général soit informé de cette liste ainsi que des Avis qui ont une incidence sur les méthodes de calcul appropriées et les critères de brouillage à utiliser;

b) Que, dans um délai de 30 jours, le Secrétaire général diffusera cette liste, ainsi que les textes pertinents à toutes les administrations, pour leur demander d'indiquer, dans un délai de quatre mois, quels sont les Avis du CCIR ou les critères techniques définis dans les Avis mentionés au paragraphe 2, *a*), ci-dessus, dont elles acceptent l'utilisation dans l'application des dispositions pertinents du Règlement des radiocommunications;

3. Que les administrations qui ne répondront pas à la demande du Secrétaire général dans un délai de quatre mois recevront télégramme demandant de communiquer leur décision concernant l'application de ces Avis dans le cadre des dispositions pertinentes du Règlement des radiocommunications. Si aucune réponse n'est reçue d'une administration dans un délai de 30 jours à compter de la date d'expédition du télégramme, on considérera que cette administration ne souhaite pas exprimer une opinion à ce moment;

4. Que, au cas où une administration, dans sa réponse à la demande du Secrétaire général, indiquera que tel Avis du CCIR, ou tel critère technique défini dans ces Avis, n'est pas acceptable pour elle, dans le cas où une administration ne répondra pas à la demande du Secrétaire général comme il est indiqué au paragraphe 3 ci-dessus, les méthodes de calcul et les critères de brouillage pertinents définis dans le Règlement des radiocommunications continueront à s'appliquer dans les cas concernant cette administration;

5. Que le Secrétaire général publiera, à titre d'information pour les administrations, une liste établie par l'IFRB sur la base des réponses reçues à la demande susvisée, des Avis du CCIR ou des méthodes de calcul et des critères de brouillage

pertinents définis dans ces Avis, avec l'indication des administrations pour lesquelles chacun de ces Avis ou chacun de ces critères techniques est acceptable ou inacceptable. Cette liste récapitulative incluera aussi les noms des administrations mentionnées au paragraphe 3 ci-dessus;

6. Que l'IFRB devra tenir compte:

a) Des conditions d'application des méthodes de calcul et des critères de brouillage du CCIR, lorsqu'il procédera à des examens techniques dans des cas intéressant uniquement des administrations pour lesquelles ces méthodes et ces critères sont acceptables;

b) Des conditions d'application des méthodes de calcul et des critères de brouillage définis dans le Règlement des radiocommunications sur la base de la liste récapitulative mentionnée au paragraphe 5 ci-dessus, lorsqu'il procédera à des examens techniques, dans des cas intéressant les autres administrations;

7. Que le Secrétaire général rappellera annuellement aux administrations qui n'auront pas encore répondu, de lui communiquer leur décision en application du paragraphe 3 ci-dessus;

8. Que, si des questions se posent ultérieurement à l'égard de l'application de l'une ou l'autre des méthodes de calcul et de l'un ou l'autre des critères de brouillage pertinents, dans un cas impliquant des administrations dont il est question au paragraphe 3 ci-dessus, l'IFRB s'enquerra auprès des administrations intéressées afin de savoir si elles seraient d'accord pour que soient appliqués les méthodes et critères techniques définis dans les Avis pertinents du CCIR et dont il est question au paragraphe 2 ci-dessus.

9. Que la liste récapitulative publiée en application du paragraph 5 ci-dessus sera mise à jour sur la base des réponses reçues en application des paragaphes 7 e 8 ci-dessus.

RECOMMANDATIONS

Note du secrétaire général

En application des décisions prises par la Conférence, les Recommandations ont été classées et numérotées dans les catégories et selon le système de numérotation indiqués ci-dessous. En outre, dans l'application de ce processus de classification, il est apparu que certaines Recommandations faisant partie d'un groupe donné étaient en rapport direct avec des Recommandations figurant dans d'autres groupes; il a été tenu compte de ce fait, afin de faciliter la consultation des textes.

RECOMMANDATION N° 1

Relative à l'utilisation de systèmes de radiocommunications spatiales en cas de catastrophes naturelles, d'épidémies, de famines et d'autres situations critiques analogues (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que, en cas de catastrophes naturelles, d'épidémies, de famines et d'autres situations critiques analogues, des vies peuvent être sauvées par des secours prompts et efficaces;
b) Que des télécommunications rapides et fiables sont essentielles pour ces opérations de secours;
c) Que, à la suite des dégats qu'ils ont subis ou pour d'autres raisons, les moyens de télécommunication normaux des zones sinistrées sont fréquemment insuffisants pour les opérations de secours et que les ressources locales ne permettent pas de les retablir ou de les compléter rapidement;
d) Que l'emploi de systèmes de radiocommunications spatiales constitue l'un des moyens qui permettrait d'assurer des télécommunications rapides et fiables pour les opérations de secours;

notant

a) Que, d'après ce que l'on sait de la planification en matière de systèmes de radiocommunications spatiales, il n'est pas prévu de fréquences ni de voies désignées pour les radiocommunications en cas de sinistre;
b) Que, faute de telles dispositions, il n'est pas possible d'établir des spécifications pour des stations terriennes à fonctionnement universel pouvant être transportées rapidement;
c) Que le Rapport 554-1 du CCIR donne les résultats les plus récents des études relatives aux stations terriennes transportables affectées aux opérations de secours;

recommande

1. Que les administrations, individuellement ou en collaboration, prennent des mesures en vue de satisfaire aux besoins d'éventuelles opérations de secours lorsqu'elles établissent les plans de leurs systèmes de radiocommunications spatiales et qu'elle déterminent à cet effet des voies radioélectriques et des moyens à utiliser de préférence, pouvant être mis en œuvre rapidement pour des opérations de secours;

2. Que les administrations intéressées renoncent à appliquer les procédures de coordination prévues dans le Règlement des radiocommunications dans le cas des stations terriennes transportables affectées aux opérations de secours;

invite le CCIR

à continuer ses études sur les spécifications types ainsi que des fréquences à utiliser de préférence, pour des stations terriennes transportables et pour des appareils compatibles transportables, pour les radiocommunications fixes et mobiles destinées aux opérations de secours.

ZI

RECOMMANDATION N° 2

Relative à l'examen, par les conférences administratives mondiales des radiocommunications, de l'état d'occupation du spectre des fréquences dans le domaine des radiocommunications spatiales (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les bandes de fréquences utilisables pour les applications spatiales sont limitées en nombre et en largeur;
b) Que les emplacements possibles pour des satellites dont l'objet principal est l'établissement de liaisons de télécommunications sont en nombre limité et que certains emplacements sont plus favorables que d'autres pour certaines liaisons;
c) Qu'il convient de permettre à toutes les administrations d'établir les liaisons spatiales qu'elles jugent nécessaires;
d) Que l'importance et le coût des réseaux ou systèmes spatiaux sont tels qu'il est nécessaire d'apporter le moins d'entraves possibles à leur exploitation et à leur développement;
e) Que la technique est en constante et rapide évolution et qu'il convient d'assurer la meilleure utilisation possible des ressources dans le domaine des radiocommunications spatiales;

---

(1) Remplace la Recommandation N° Spa2-13 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).
(2) Remplace la Recommandation N° Spa2-1 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

f) Que les administrations doivent faire en sorte que les assignations de fréquence pour des applications spatiales soient utilisées de façon aussi efficace que possible en tenant compte du développement de la technique et soient abandonnées lorsqu'elles ne sont plus en service;

g) Que, malgré les dispositions de l'article 11 du Règlement des radiocommunications et les principes adoptés par la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971) lesquels prévoient des procédures de consultation et de coordination très étendues entre administrations en vue d'aménager au mieux tous les systèmes spatiaux, il peut se faire que, avec l'accroissement de l'emploi des fréquences et des emplacements orbitaux, les administrations rencontrent indûment des difficultés dans une ou plusieurs bandes de fréquences pour faire face à leurs besoins en matière de radiocommunication spatiales;

recommande

que la prochaine Conférence administrative mondiale des radiocommunications appropriée soit habilitée à traiter de la situation décrite au *considérant g)*, si elle se présente;

invite en conséquence le Conseil d'administration

si une telle situation se présente, à fixer l'ordre du jour de la prochaine Conférence administrative mondiale des radiocommunications appropriée de manière à lui permettre d'examiner sous tous ses aspects l'utilisation de la ou des bandes de fréquences considérées, y compris notamment les assignattions en cause enregistrées dans le Fichier international de référence des fréquences, et de trouver une solution au problème.

XO

RECOMMANDATION N° 3

Relative à la transmission d'énergie électrique au moyen de fréquences radioélectriques à partir d'un engin spatial

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il peut être possible dans le futur, du point de vue technique, de transformer certains parties du rayonnement solaire en énergie éléctrique à bord d'un engin spatial et de transmettre cette énergie jusqu'à la Terre par des techniques de transmission radioélectrique, et que cette énergie pourrait compléter les ressources mondiales d'énergie;

b) Que la transmission éventuelle de rayonnements d'une telle puissance pourrait avoir des effets défavorables sur la propagation dans l'ionosphère des ondes radioélectriques destinées à d'autres services;

reconnaissant

a) Qu'il faudrait garantir que la transmission, au moyen de fréquences radioélectriques, de l'énergie électrique recueillie dans l'espace ne cause pas de brouillages préjudiciables aux services de radiocommunication;

b) Qu'il faut évaluer les conséquences écologiques et biologiques éventuelles de la transmission radioélectrique de cette énergie, notamment pour des aéronefs traversant les faisceaux des antennes qui serviront à cette transmission;

notant

que le Rapport de la Réunion spéciale préparatoire à la Conférence administrative mondiale des radiocommunications (Génève, 1979) fait état de la possibilité technique de construire un satellite pour recueillir l'énergie solaire;

notant également

les dispositions de l'article 6 du Règlement des radiocommunications relatives à l'obligation pour les administrations de ne pas causer de brouillage préjudiciable aux services de radiocommunication fonctionnant conformément aux dispositions du Règlement;

recommande au CCIR

d'étudier de manière appropriée, sous tous leurs aspects, les effets de cette transmission radioélectrique d'énergie à partir de l'espace sur un service de radiocommunication et de formuler des recommandations appropriées, compte tenu des incidences écologiques et biologiques;

invite le Secrétaire général

à transmettre cette Recommandation au Secrétaire général des Nations Unies.

YJ

RECOMMANDATION N° 4

Relative à l'amélioration du groupement des liaisons des réseaux nationaux et internationaux de radiocommunication fonctionnant dans les bandes comprises entre 4000 kHz et 27 500 kHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Les besoins en fréquences toujours croissants, notamment dans les bandes comprises entre 4000 kHz et 27 500 kHz;
b) La structure actuelle des réseaux nationaux et internationaux de radiocommunication dans ces bandes;
c) Le trafic relativement réduit sur certaines liaisons de ces réseaux;
d) Les dispositions de la Convention internationale des télécommunications (Malaga-Torremolinos, 1973), relatives à l'utilisation rationelle des fréquences et du spectre (article 33);

tenant compte du fait

a) Que le rendement d'un groupe de liaisons est supérieur à la somme des rendements des liaisons individuelles;
b) Qu'il est, en conséquence, possible de diminuer le nombre total des fréquences nécessaires;
c) Que, dans certains parties du monde, il existe des zones et des pays interconnectés par plusieurs liaisons tant radioélectriques que par câbles;

recommande

1. Que, dans tous les cas où cela est possible, les administrations s'efforcent, en groupant plus efficacement les liaisons radioélectriques à faible trafic, de diminuer l'encombrement des bandes comprises entre 4000 kHz et 27 500 kHz;
2. Que les pays interconnectés par des liaisons radioélectriques ou par câbles concluent, chaque fois que c'est possible en pratique, des accords particuliers relatifs à l'utilisation en commun des liaisons radioélectriques internationales existantes et fonctionnant dans les bandes comprises entre 4000 kHz et 27 500 kHz;
3. Qu'en règle générale ces accords procurent à chacun des pays participants des avantages équivalents en ce qui concerne les conditions financières et les moyens d'exploitation;
4. Qu'en projetant de nouvelles liaisons radioélectriques ou l'extension de celles qui existent déjà, les administrations tiennent compte, autant que possible, des principes énonces aux points 1 à 3 ci-dessus.

YI

RECOMMANDATION N° 5

Relative aux moyens à mettre en œuvre pour réduire l'encombrement de la bande 7 (3-30 MHz) (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

reconnaissant

a) Qu'il est nécessaire de réduire d'urgence le volume des demandes portant sur la bande 7 du spectre des fréquences radioélectriques;
b) Qu'en tirant parti des derniers progrès de la technique des télécommunications, et notamment de ceux réalisés dans l'utilisation des bandes 8 et au-delá, dans l'emploi de câbles coaxiaux, etc., il est possible de contribuer à cette réduction;
c) Que l'utilisation de moyens techniques perfectionnés de remplacement conduirait à des frais considérables, tendis qu'il serait moins onéreux de continuer à employer les fréquences de la bande 7, et que, dans ces conditions, certaines administrations éprouveraient plus de difficultés que d'autres, plus favorisées, à mettre en œuvre ces nouveaux moyens;

recommande

1. Que toutes les administrations prennent les mesures nécessaires pour réduire le volume des demandes portant sur la bande 7, en donnant aux techniques nouvelles la plus grande extension possible;
2. Que les organisations internationales qui donnent leur assistance soient priées d'envisager tout spécialement de fournir aux administrations qui ne sont pas en mesure de se les procurer elles-mêmes pour des raisons d'ordre économique,

---

(1) Remplace la Recommandation N° 11 de la Conférence administrative des radiocommunications (Génève, 1959).
(2) Remplace la Recommandation N° 10 de la Conférence administrative des radiocommunications (Génève, 1959).

des matériels appropriés permettant à ces administrations de mettre en œuvre des moyens de télécommunication de remplacement, contribuant ainsi a une plus grande économie dans l'utilisation de la bande 7.

XH RECOMMANDATION Nº 6

Relative aux besoins pratiques des pays qui ont besoin d'assistance spéciale (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

recommande

à toutes les administrations de s'efforcer particulièrement de collaborer avec les administrations des pays qui ont besoin d'assistance spéciale, en leur fournissant des renseignements de contrôle des émissions et une assistance technique de nature à les aider à obtenir des assignations de fréquence convenant à leurs liaisons;

invite l'IFRB

à fournir aux administrations des pays qui ont besoin d'assistance spéciale les renseignements et données techniques qui leur sont nécessaires, y compris des explications détaillées sur le Règlement des radiocommunications, de manière à leur permettre de choisir et de se procurer des assignations de fréquence convenant au fonctionnement de leurs liaisons.

XK RECOMMANDATION Nº 7

Relative à l'adoption de modèles normalisés de licences délivrées aux stations de navire et aux stations d'aéronef (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la normalisation des modèles de licences délivrées aux stations des navires ou des aéronefs qui effectuent des parcours internationaux faciliterait considérablement l'inspection de ces stations;
b) Que des modèles normalisés de licences à délivrer aux stations de navire et d'aéronef serviraient utilement de guide aux administrations qui désirent améliorer leurs modèles actuels de licences nationales;
c) Que ces modèles normalisés de licence pourraient avantageusement être utilisés par ces administrations pour constituer l'attestation dont il est question au numéro **2027** du Règlement des radiocommunications;

considérant en outre

que la Conférence administrative des radiocommunications (Génève, 1959) a élaboré:

a) Une série de principes pour la mise au point des modèles normalisés de licences (voir l'annexe 1);
b) Des modèles de licences à délivrer aux stations de navire et aux stations d'aéronef (voir les annexes 2 et 3):

recommande

1. Que les administrations, si elles trouvent ces modèles pratiques et acceptables, les adoptent pour l'usage international;
2. Que les administrations s'efforcent, autant que possible, de rendre leurs modèles de licences nationales conformes à ces modèles normalisés.

ANEXXE À LA RECOMMANDATION Nº 7

Principes à suivre pour l'élaboration de modèles normalisés de licences à délivrer aux stations de navire et aux stations d'aéronef

La Conférence administrative des radiocommunications (Génève, 1959), a considéré que, lors de l'élaboration des modèles normalisés de licences de stations de navire et d'aéronef, il convient:

1. De présenter autant que possible les modèles de licences sous forme de tableaux. Les lignes et les colonnes de ce tableau sont à repérer par des lettres ou des chiffres;

---

(1) Remplace la Recommandation Nº 35 de la Conférence administrative des radiocommunications (Génève, 1959).
(2) Remplace la Recommandation Nº 17 de la Conférence administrative des radiocommunications (Génève, 1959)

2. De donner une forme aussi semblable que possible aux licences des stations de navire et aux licences des stations d'aéronef;

3. De donner aux licences de format international A4;

4. De présenter les licences sous une forme facilitant au maximum la vérification de ces documents à bord des navires ou des aéronefs;

5. D'imprimer les licences en caractères latins dans la langue nationale du pays qui les délivre. Les administrations des pays dont la langue nationale ne peut être écrite en caractères latins utiliseront cette langue nationale et, en outre, une langue de travail de l'Union;

6. De placer en tête de la licence le titre: «Licence de station de navire» ou «Licence de station d'aéronef». Ce titre sera libellé dans la langue nationale du pays dont il émane, ainsi que dans les trois langues de travail de l'Union.

Ces principes ont été appliqués lors de l'élaboration des modèles de licence qui font l'objet des annexes 2 et 3.

ANNEXE 2 À LA RECOMMANDATION Nº 7

(Nom complet de l'autorité délivrant le licence, écrit dans la langue nationale)

... (*a*)

SHIP STATION LICENCE

LICENCE DE STATION DE NAVIRE

LICENCIA DE ESTACIÓN DE BARCO

Nº ...

Durée de validité ...

Conformément à ... (*Réglementation nationale*) et au Règlement des radiocommunications annexé à la Convention internationale des télécommunications actuellement en vigueur, la présente autorisation est délivrée pour l'installation et pour l'utilisation de l'équipement radioélectrique décrit ci-dessous:

1	2	3	4
Nom du navire	Indicatif d'appel ou autre mode d'identification	Armateur du navire	Catégorie de correspondance publique

	Appareil	a	b	c	d
		Type	Puissance (watts)	Classe d'émission	Bandes de fréquences ou fréquences assignées
5	Emetteurs				(*b*)
6	Emetteurs de secours de navire				(*b*)
7	Emetteurs d'engin de sauvetage ...				(*b*)
8	Autre appareil	*(Facultatif)*			

(*a*) Les mots «Licence de station de navire» sont à écrire dans la langue nationale au cas où cette langue n'est pas une langue de travail de l'Union.

(*b*) Valeur numérique ou symbole.

Pour l'autorité délivrant la licence:

... (Lieu) ... (Date) ... (Marque d'authentification)

ANNEXE 3 À LA RECOMMANDATION Nº 7

(Nom complet de l'autorité délivrant le licence, écrit dans la langue nationale)

... (*a*)

AIRCRAFT STATION LICENCE

LICENCE DE STATION D'AÉRONEF

LICENCIA DE ESTACIÓN DE AERONAVE

Nº ...

Durée de validité ...

Conformément à ... *(Réglementation nationale)* et au Règlement des radiocommunications annexé à la Convention internationale des télécommunications actuellement en vigueur, la présente autorisation est délivrée pour l'installation et pour l'utilisation de l'équipement radioélectrique décrit ci-dessous:

1	2	3	4
Nationalité et signes d'immatriculation de l'aéronef	Indicatif d'appel ou autre mode d'identification	Type de l'aéronef	Propriétaire de l'aéronef

	Appareil	a	b	c	d
		Type	Puissance (watts)	Classe d'émission	Bandes de fréquences ou fréquences assignées
5	Emetteurs				(*b*)
6	Emetteurs d'engin de sauvetage *(s'il y a lieu).*				(*b*)
7	Autre appareil	*(Facultatif)*			

(*a*) Les mots «Licence de station d'aéronef» sont à écrire dans la langue nationale au cas où cette langue n'est pas une langue de travail de l'Union.

(*b*) Valeur numérique ou symbole.

Pour l'autorité délivrant la licence:

... (Lieu) ... (Date) ... (Marque d'authentification)

XN

RECOMMANDATION Nº 8

Relative à l'identification automatique des stations

La Conférence administrative mondiale des radiocommunications (Génève, 1979).

considérant

a) Que l'article 25 du Règlement des radiocommunications autorise, chaque fois que cela est possible, l'identification automatique des stations dans les services appropriés et dans certaines circonstances;

b) Qu'il n'est pas toujours réalisable ni opportun de donner une identification manuelle;

c) Que les sources de brouillage préjudiciable ne sont souvent pas identifiées pendant de longues périodes et que les mesures qui pourraient être prises en vue d'atténuer le brouillage s'en trouvent retardées;

d) Que les procédures relatives à l'identification automatique peuvent aider, le cas échéant, à pallier certains inconvénients de l'identification manuelle;

e) Que l'émission automatique d'un indicatif d'appel ou d'autres signaux peut permettre d'identifier certaines stations qu'il n'est pas toujours possible d'identifier, par exemple, les faisceaux hertziens et les systèmes spatiaux;

f) Qu'il est souhaitable de promouvoir une méthode d'identification automatique commune afin de faciliter la mise en application effective des dispositions de l'article 25, ce qui empêcherait la prolifération de nombreux systèmes et techniques de modulation variés qui pourraient être utilisés à cette fin;

recommande

au CCIR d'étudier la question de l'identification automatique des stations en vue de recommander des caractéristiques techniques et des méthodes de mise en application d'un système universel commun, y compris des techniques de modulation normalisées, qui seront appliquées conformément aux dispositions de l'article 25, en tenant dûment compte des besoins des différents services et types de stations.

ZG RECOMMANDATION Nº 9

Relative aux mesures à prendre pour empêcher le fonctionnement de stations de radiodiffusion à bord de navire ou d'aéronefs hors des limites des territoires nationaux (1)

La Conférence administrative mondiale des radiocommunications (Genève, 1979).

considérant

a) Que le fonctionnement de stations de radiodiffusion à bord de navires ou d'aéronefs situés hors des limites du territoire national d'un pays est contraire aux dispositions des numéros **2665** et **3603** du Règlement des raddiocommunications;
b) Que semblable fonctionnement est contraire à l'utilisation rationnelle des fréquences et peut finir par créer une situation extrémement confuse;
c) Que le fontionnement de telles stations de radiodiffusion peut faire en dehors de toute juridiction des pays Membres et rendre ainsi malaisée l'application directe des lois nationales;
d) Qu'on peut de trouver en présence d'une situation particulièrement difficile du point de vue juridique lorsque ces stations de radiodiffusion fonctionnent à bord de navires ou d'aéronefs qui n'ont été régulièrement immatriculés dans aucun pays;

recommande

1. Que les administrations demandent à leurs gouvernement respectifs d'une part d'examiner par quels moyens, directs ou indirects, il est possible d'éviter ou de faire cesser le fonctionnement des strations susmentionnées et, d'autre part, de prendre s'il y a lieu les mesures qui s'imposent;

2. Que les administrations communiquent au Secrétaire général le résultat de ces études et lui transmettent toute autre indication d'intérêt général afin qu'il puisse, à son tour, en informer les Membres.

XF RECOMMANDATION Nº 10

Relative à la présentation des propositions de modification aux textes du Règlement des radiocommunications (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979).

ayant pris note

a) Du fait que, dans le propositions présentées par certaines administrations, un système uniforme a été utilisé pour présenter les textes modifiés (textes nouveaux soulignés, textes supprimés biffés);
b) Que ce système s'est révélé très efficace lors de l'examen des textes proposés;
c) Que si ce système uniforme était appliqué aux différents stades d'élaboration des textes d'une conférence (sous-groupes de travail, groupes de travail), cela faciliterait la tâche des délégations et pourrait faciliter celle de la conférence;
d) Que le Secrétaire général a pris des mesures pour donner des directives administratives, afins de les aider dans la présentation de leurs propositions aux conférences administratives, conformément aux dispositions de la Convention internationale des télécomunications, et dans la coordination de leur présentation aux conférences;

---

(1) Remplace le Recommandation Nº 16 de la Conférence administrative des radiocommunications (Génève, 1959).
(2) Remplace le Recommandation Nº Mar2-20 de la Conférence administrative des radiocommunications maritimes (Génève, 1974).

recommande

1. Que les administrations soient invitées à présenter leurs propositions de manière uniforme;
2. Que, afin de faciliter cette présentation, le Secrétaire général publie des directives qui devront aussi être appliquées lors des futures conférences;
3. Que, lors de prochaines conférences administratives des radiocommunications, on utilise une présentation uniforme aux différents stades d'élaboration des textes au moins jusqu'au niveau des groupes de travail.

B

RECOMMANDATION Nº 11

Relative à la numérotation figurant dans la marge du Règlement des radiocommunications

La Conférence administrative mondiale des radiocommunications (Génève, 1979).

considérant

a) Qu'à chaque article du Règlement des radiocommunications esta associé un système logique de numérotation des paragraphes et des sous-paragraphes et que des numéros consécutifs sont ajoutés dans la marge, en regard de chaque disposition, principalement pour faciliter les références;
b) Que cette numérotation dans la marge est largement utilisée par les administrations et les organismes permanents de l'Union;
c) Que l'on a prévu des séries de numéros en réserve à la fin de chaque article du Règlement des radiocommunications révisé (Génève, 1979), pour faciliter l'adjonction para les futures conférences administratives mondiales des radiocommunications de nouvelles dispositions, et en particulier de nouveaux articles;

reconnaissant

a) Que de grands efforts sont nécessaires pour se familiariser avec de nouveaux numéros figurant dans la marge en sorte que leur modification éventuelle para une conférence administrative mondiale des radiocommunications entreprenant une révision partialle du Règlement des radiocommunicaions pourraît entraîner de difficultés;
b) Que la révision de ce système de numérotation dans la marge n'est indispensable que si une future conférence administrative mondiale des radiocommunications est convoquée pour entreprendre une révision générale du Règlement des radiocommunications;

recommande

1. Qu'une future conférence administrative mondiale des radiocommunications entreprenant une révision partielle du Règlement des radiocommunications n'utilise les numéros en réserve que lorsqu'il y a lieu d'inserer des dispositions supplémentaires à la fin des articles;
2. Que, s'il est nécessaire d'insérer une ou plusiers dispositions supplémentaires dans un article, des références alphabétiques supplémentaires soient utilisées comme suffixe à la suite des numéros de marge attribués;
3. Qu'en cas de suppression d'une disposition existante, le numéro figurant dans la marge ne soit pas réutilisé.

XM

RECOMMANDATION Nº 12

Relative à la convocation de futures conférences administratives des radiocommunications traitant de services déterminés

La Conférence administrative mondiale des radiocommunications (Genève, 1979).

notant

a) Que le point 2.10 de son mandat l'invite à proposer au Conseil d'administration et à la prochaine Conférence de plénipotentiaires un programme pour la convocation des futures conférences administratives des radiocommunications traitant de services déterminés;
b) Que plusieurs de ses Résolutions et Recommandations demandent ou mentionnent la convocation de ces futures conférences;

considérant

a) Qu'en établissant le calendrier des futures conférences administratives mondiales des radiocommunications, il convient de prendre en considération d'autres conférences auxquelles participent les Membres de l'Union et notamment les conférences régionales et sous-régionales, la Conférence de plénipotentiaires et les réunions du CCIR;
b) Que les conférences doivent être suffisamment espacées afin que les administrations et les organismes permanents de l'Union disposent de délais suffisants pour la préparation de chaque conférence;

c) Qu'un certain nombre de sujets particuliers, évoqués dans les Résolutions et les Recommandations mentionnées au paragraphe *b*) sous *notant*, doivent être traités par une conférence compétente et qu'il appartient au Conseil d'administration de prendre, en temps utile, les mesures nécessaires à l'inclusion de chaque question dans l'ordre du jour de la conférence appropriée;

recommande au Conseil d'administration et, s'il y a lieu, à la Conférence de plénipotentiaires

1. D'inclure les conférences administratives mondiales des radiocommunications suivantes dans le calendrier des futures conférences:

Conférence administrative mondiale des radiocommunications pour les services mobiles (voir la Résolution **202**);

Conférence administrative mondiale des radiocommunications pour la planification des bandes d'ondes décamétriques attribuées au service de radiodiffusion (voir la Résolution **508** et les Recommandations **500** et **501**);

Conférence administrative mondiale des radiocommunications sur l'utilisation de l'orbite des satellites géostationnaires et la planification des services spatiaux utilisant cette orbite (voir la Résolution **3**);

2. D'inclure les conférences administratives régionales des radiocommunications suivantes dans le calendrier des futures conférences:

Session finale de la Conférence pour la radiodiffusion en ondes hectométriques dans la Région 2 (déjà prévue pour novembre 1981);

Conférence pour la planification du service de radiodiffusion par satellite dans la Région 2 (déjà prévue pour le deuxième trimestre 1983) (voir la Résolution **701**);

Conférence pour la planification de la radiodiffusion sonore dans la bande 87,5-108 MHz pour la Région 1 et certains pays concernés de la Région 3 (voir la Résolution **510**);

Conférence pour la conclusion d'accords et l'établissement des plans associés pour les liaisons montantes vers les satellites de radiodiffusion fonctionnant dans la bande des 12 GHz dans les Régions 1 et 3 (voir la Résolution **101**);

Conférence administrative régionale des radiocommunications chargée de définir des critères de partage pour l'utilisation des bandes des ondes métriques et décimétriques attribuées aux services fixe, de radiodiffusion et mobile dans la Région 3 (voir la Résolution **702**);

Conférence chargée de réviser la Convention et le Plan de Copenhague de 1948 pour la Zone maritime européenne — Région 1 (voir également à ce sujet la Recommandation **300**);

Conférence chargée de réexaminer et de reviser les dispositions des Actes finals de la Conférence africaine de radiodiffusion en ondes métriques et décimétriques (Génève, 1963) (voir la Résolution **509**);

Conférence chargée de la préparation d'un plan de radiodiffusion dans la bande 1605-1705 kHz dans la Région 2 (voir la Recommandation **504**);

3. De prendre les mesures nécessaires pour convoquer chacune de ces conférences aussitôt que possible après l'achèvement des travaux préparatoires qui s'y rapportent, en tenant compte:

a) Des opinions relatives au calendrier des conférences, comme prévu dans les Recommandations et les Résolutions qui sont mentionnées aux paragraphes 1 et 2 sous *recommande*;

b) De la nécessité d'espacer ces conférences de façon adéquate afin que les administrations et les organismes permanentes de l'Union disposent de délais suffisants pour leur préparation;

c) Du programme des conférences projetées prévues, autres que les conférences administratives des radiocommunications, auxquelles doivent participer les Membres de l'Union;

d) Des ressources que les diverses administrations et l'Union dans son ensemble devront consacrer à la réalisation de ce programme de conférences.

XP RECOMMANDATION N° 13

Relative à une conférence administrative mondiale des radiocommunications pour une révision générale ou partielle du Règlement des radiocommunications

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

que la présente Conférence a établi un programme des conférences administratives mondiales spécialisées des radiocommunications pour la prochaine décennie;

considérant

l'evolution très rapide de la technologie des télécommunications et les conséquences de son application notamment sur l'utilisation rationnelle du spectre radioélectrique;

considérant

la nécessité d'une révision générale ou partielle du Règlement des radiocommunications pour permettre le développement harmonieux de plusieurs services qui ne seront pas traités par les conférences spécialisées prévues par la présente Conférence;

recommande au Conseil d'administration

d'examiner, à partir de 1990, s'il est nécessaire de convoquer une conférence administrative mondiale des radiocommunications à l'effet de procéder à une révision générale ou partielle du Règlement des radiocommunications.

D

RECOMMANDATION N° 30

Relative au contrôle international des émissions (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il est désirable d'obtenir une utilisation plus efficace du spectre des fréquences radioélectriques afin d'aider les administrations à satisfaire plus aisément leurs besoins en fréquences, et qu'à cette fin il est désirable de prendre des mesures pour la Liste international des fréquences reflète plus fidèlement l'utilisation réelle du spectre des fréquences;

b) Les dispositions du Règlement des radiocommunications (Génève, 1979), d'après lesquelles le Comité international d'enregistrement des fréquences doit réviser les inscriptions contenues dans le Fichier de référence international des fréquences en vue de les rendre aussi conformes que possible à l'utilisation réelle du spectre des fréquences;

c) Que les données provenant du contrôle international des émissions devraient aider ce Comité à s'acquitter de cette fonction;

reconnaissant

a) Qu'un système international de contrôle des émissions ne peut être pleinement efficace que s'il couvre toutes les zones du monde;

b) Que, dans certaines zones du monde, les moyens à cet effet sont actuellement inexistants ou insuffisants pour permettre un contrôle effectif;

invite le CCIR

à étudier et à élaborer, en collaboration avec le Comité, des avis techniques concernant les moyens supplémentaires requis pour assurer une couverture mondiale appropriée en vue de la mise en œuvre du Règlement des radiocommunications, plus spécialement les articles 10, 11, 12, 13, 14 et 20; et

invite les administrations

1. À faire tous les efforts afin de développer les moyens de contrôle, ainsi qu'il est envisagé à l'article 20 du Règlement des radiocommunications, compte tenu des possibilités offertes par les organismes des Nations Unies chargés de l'assistance technique;

2. À informer le Comité de la mesure dans laquelle elles sont disposées à coopérer à des contrôles de nature déterminée qui seraient demandés par ce Comité.

YG

RECOMMANDATION N° 31

Relative à un manuel sur l'application des techniques informatiques à la gestion du spectre radioélectrique

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'en raison de la demande croissante de fréquences radioélectriques, il convient d'améliorer l'utilisation du spectre radioélectrique;

b) Que, pour résoudre les problèmes posés par l'utilisation du spectre radioélectrique, il faut disposer de moyens de stockage, d'extraction e d'analyse des données que peuvent procurer les méthodes informatiques;

---

(1) Remplace le Recommandation N° 5 de la Conférence administrative des radiocommunications (Génève, 1959).

c) Que la gestion du spectre radioélectrique représente, pour les administrations, une série de tâches dont l'ampleur et la complexité vont croissant;
d) Que, grâce aux progrès techniques, on peut se procurer des ordinateurs puissants e des mini-ordinateurs d'un prix raisonnable;
e) Que beaucoup d'administrations ont besoin de directives sur les techniques informatiques applicables à la gestion du spectre radioélectrique;
f) Qu'une certains compatibilité est souhaitable pour faciliter le coordination entre administrations et l'échange de données avec l'IFRB;
g) Que de nombreuses administrations s'intéressent aux systèmes informatiques de gestion radioélectrique et que certaines d'entre elles mettent activement au point ces systèmes;
h) Que le Secrétariat général met des moyens informatiques à la disposition de tous les organismes permanentes de l'Union et leur fournit des conseils en ce domaine et, le cas échéant, en fournit également aux administrations;

recommande au CCIR

1. D'établir au plus tard eu 1982 un manuel qui décrive les différents aspects de l'application des techniques informatiques à la gestion du spectre radioélectrique, examine le différents façons dont la question a été abordée, donne des directives appropriées aux divers niveaux des applications pratiques et contienne des avis pour le cas où la coopération internationale entre en jeu;
2. De réexaminer et de réviser périodiquement ce manuel;

invite le Secrétariat général et l'IFRB

à participer à l'elaboration de ce manuel.

Q RECOMMANDATION Nº 60

Relative aux Normes techniques de l'IFRB (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

reconnaissant

que les Normes techniques du Comité international d'enregistrement des fréquences (IFRB) sont d'un usage quotidien pour l'examen technique des avis de notification d'assignation de fréquence;

prie instamment le CCIR

de hâter l'exécution de toutes les phases des programmes d'études qui son de nature à aider l'IFRB à perfectionner encore ses Normes techniques; et

invite les administrations

à accorder, dans leur participation aux travaux du CCIR et de ses comissions d'études, une priorité spéciale aux études dont il s'agit.

ZB RECOMMANDATION Nº 61

Relative aux normes techniques nécessaires à l'évaluation des brouillages préjudiciables dans les bandes de fréquences supérieures à 28 MHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la définition du brouillage préjudiciable (numéro 163 du Règlement des radiocommunications), de caractère qualitatif, donne lieu à une estimation purement subjective de la nuisance;
b) Que pour l'accomplissement de ses tâches réglementaires, l'IFRB a adopté pour ses Normes techniques dans les bandes de fréquences inférieures à 28 MHz, des valeurs du rapport signal utile/signal brouilleur au-dessous desquelles on peut s'attendre à un brouillage préjudiciable;

---

(1) Remplace la Recommandation Nº 2 de la Conférence administrative des radiocommunications (Génève, 1959).
(2) Remplace la Recommandation Nº Spa2-12 de la Conférence administrative des radiocommunications (Génève, 1959).

c) Que le «brouillage préjudiciable» implique un degré de brouillage ou une probabilité de brouillage considérable;

d) Qu'en conséquence, il est souhaitable de déterminer le niveau de brouillage pour lequel les émissions, rayonnements ou inductions influencent défavorablement un service de radiocommunication au-delà des limites spécifiques établies pour son fonctionnement, du point de vue de la qualité et de la fiabilité réquises para la nature de ce service;

e) Que l'évaluation du niveau de brouillage et liée à des facteurs tels que la nature des services en cause, le nombre des sources de brouillage, les pourcentages du temps durant lesquells le signal brouiller influence défavorablement le signal utile;

notant

a) Que jusqu'ici l'IFRB a considéré les valeurs maximales admissibles du brouillage, telles qu'elles sont spécifées dans les Avis pertinents du CCIR, comme étant des valeurs qui permettent d'assurer un service satisfaisant;

b) Que l'IFRB ne possède cependant pas de renseignements sur la mesure dans laquelle ces valeurs recommandées et les pourcentages de temps associés peuvent être dépassés sans qu'un service en soit défavorablement influencé au-delà des limites spécifiques établies pour son fonctionnement, du point de vue de la qualité et de la fiabilité requises para la nature de ce service;

invite le CCIR

à poursuivre, l'étude de cette question et à recommander des critères techniques pour les bandes de fréquences supérieures à 28 MHz attribuées aux services de radiocommunication spatiale, à la radioastronomie et aux services de radiocommunications de Terre intéressés, afin de permettre à l'IFRB et aux administrations d'appliquer les critères ainsi définis pour ces bandes.

K RECOMMANDATION Nº 62

Visant à compléter les caractéristiques additionnelles de classification des émissions et à fournir de nouveaux exemples de désignations complètes des émissions tels qu'ils figurent dans l'appendice 6 (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que ladite Conférence a adopté dans l'article 4 une nouvelle méthode de désignation des émissions fondée sur l'Avis 507 du CCIR;

b) Qu'une partie essentielle de cette nouvelle méthode est la classification des émissions;

c) Que la nouvelle méthode de classification des émissions établit une distinction entre les caractéristiques fondamentales (premier, deuxième et troisième symbole) dont l'utilisation est obligatoire et les caractéristiques additionnelles (quatrième et cinquième symbole) dont l'utilisation est facultative;

d) Que la classification complète des émissions couvre l'ensemble de ces cinq symboles;

e) Que la liste des caractéristiques additionnelles donnée dans la partie A de l'appendice 6, n'est peut-être pas suffisamment complète pour tenir compte dans l'avenir des nouvele techniques et que, de ce fait, elle peut faire l'object de compléments à intervalles relativament fréquents;

f) Qu'un Avis du CCIR fournirait un cadre approprié pour ce complément;

considérant en outre

a) Qu'un liste d'exemples de désignations complètes d'émissions est donnée dans la partie B de l'appendice 6;

b) Que cette liste n'est toutefois pas exhaustive et que le numéro **265** du Règlement des radiocommunications en conséquence que d'autres exemples pourraient être donnés dans les Avis le plus récents du CCIR et que ces exemples pourraient également être publiés dans le préface à la Liste internationale des fréquences;

invite le CCIR

À poursuivre ses études sur la classification des émissions, en vue de compléter la liste des caractéristiques additionnelles pour tenir compte dans l'avenir des nouvelles techniques sans toutefois modifier les caractéristiques additionnelles ayant fait l'objet d'accord et figurant dans la partie A de l'appendice 6;

---

(1) Remplace le Recommandation Nº 8 de la Conférence administrative des radiocommunications (Génève, 1959).

2. À fournir des exemples de désignations complètes d'émission qui ne sont pas données dans la partie B de l'appendice 6, compte tenu également des compléments au paragraphe 1 ci-dessus;

invite le Comité international d'enregistrement des fréquences

à publier, dans la préface à la Liste international des fréquences, les nouvelles caractéristiques additionnelles ainsi que les nouveaux exemples mentionnées aux paragraphes 1 et 2 ci-dessous, aussitôt qu'ils seront consignés dans les Avis pertinents du CCIR;

et recommande

que les administrations utilisent les caractéristiques additionnelles complétées dont ils est question au paragraphe 1 ci-dessus.

M RECOMMANDATION Nº 63

Relative à la présentation de formules et d'exemples pour le calcul des largeurs de bande nécessaires

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que, selon l'article 4 du Règlement des radiocommunications, la largeur de bande nécessaire doit faire partie de la désignation complète des émissions;
b) Que la partie B de l'appendice 6 donne une liste partielle d'exemples et des formules pour le calcul de la largeur de bande nécessaire de certaines émissions typiques;
c) Que l'on ne dispose pas de données suffisantes pour déterminer les facteurs K urtilisés dans tout le tableau d'exemples de largeurs de bande nécesssaire qui figure dans l'appendice 6;
d) Que, du point de vue plus particulier de l'utilisation efficace du spectre radioélectrique, ainsi que du contrôle et de la notification des émissions, il faut connaître les largeurs de bande nécessaire pour les différentes classes d'émission;
e) Qu'il est souhaitable, pour des raisons de simplicité et d'uniformité internationale, que les mesures visant à déterminer la largeur de bande nécessaire soient faites aussi rarement que possible;

recommande que le CCIR

1. Fournisse à intervalles de temps convenables des formules additionnelles permettant de déterminer la largeur de bande nécessaire pour les classes d'émissons courantes ainsi que des exemples destinés à compléter ceux de la partie B de l'appendice 6;
2. Étudie et indique des valeurs pour les facteurs K supplémentaires dont on a besoin pour calculer la larguer de bande nécessaire pour les classes d'émissons courantes;

invite l'IFRB

à publier des exemples de tels calculs dans la Préface à la Liste internationale des fréquences.

R RECOMMANDATION Nº 64

Relative aux rapports de protection et aux champs minimaux nécessaires (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

reconnaissant

que les renseignements dont on dispose sur le rapport de protection et le champ minimal nécessaires pour chaque service doivent être encore plus précis pour pouvoir établir les plans le plus efficaces pour l'utilisation du spectre des fréquences radioélectriques;

invite le CCIR

1. À poursuivre l'étude des rapports de protection qui définissent le seuil de brouillage préjudiciable pour les différents services;

(1) Remplace le Recommandation Nº 3 de la Conférence administrative des radiocommunications (Génève, 1959).

2. À poursuivre l'étude des rapports signal/bruit et des champs minimaux nécessaires pour recevoir de façon satisfaisante les différentes classes d'émission dans les différents services;

3. À poursuivre l'étude des marges contre les évanouissements dans les différents services;

4. À accorder une attention particulière à ces études qui aideront l'IFRB à améliorer encore les Normes techniques qu'il emploie.

ZM

RECOMMANDATION Nº 65

Relative aux techniques permettant d'elaborer de nouveaux schémas de partage du spectre et d'utilisation des bandes de fréquences

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

reconnaisant

a) Que les progrès techniques, notamment en ce qui concerne les techniques radioélectriques numériques, ainsi que les nouveaux procédés de codage, de modulation et d'accès rendent possible l'établissement de nouveaux schémas de partage offrant des avantages économiques et techniques et permettant d'accroitre l'efficacité du partage du spectre et de l'utilisation des bandes de fréquences;

b) Que l'on constate des progrès rapides en ce qui concerne les techniques connexes;

invite le CCIR

1. À procéder à l'étude des techniques radioélectriques numériques et des nouveaux procédés de codage, de modulation et d'accès, par exemple dans les techniques de radiocommunication par paquets et d'étalement du spectre et des systèmes à fonctions multiples;

2. À mettre au point de nouvelles méthodes pour l'utilisation d'une porteuse en partage dans le temps par différents services de radiocommunication, autremment dit l'utilisation d'une même partie du spectre par plusieurs services;

3. À présenter des Avis sur les sujets suivants pour les futures conférences administratives mondiales des radiocommunications pertinentes:

Critères techniques et spécifications des schémas de partage du spectre les plus efficaces pour les divers services;

Critères techniques et critères de qualité permettant d'assurer la compatibilité et l'interfonctionnement des systèmes;

Critères sur lesquels fonder la gestion du spectre pour les systèmes conformes à ces nouvelles techniques.

L

RECOMMANDATION Nº 66

Au sujet d'études sur les niveaux maximaux tolérés de rayonnements non essentiels

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que l'appendice 8 au Règlement des radiocommunications spécifie les niveaux maximaux tolérés des rayonnements non essentiels, exprimés en niveau de puissance moyenne de n'importe quelle composante non essentielle fournie par un émetteur à la ligne d'alimentation de l'antenne, pour les bandes de fréquences inférieurs à 17,7 GHz;

b) Que l'objectif principal de l'appendice 8 est de spécifier les niveaux maximaux tolérés des rayonnements non essentiels qui, tout en étant réalisables, assurent une protection suffisante contre les brouillages préjudiciables;

c) Que des niveaux excessifs des rayonnements non essentiels peuvent causer des brouillages préjudiciables;

d) Que, si l'appendice 8 ne traite que de la puissance moyenne de l'émetteur et des rayonnements non essentiels, il existe toutes sortes de rayonnements pour lesquels l'interprétation du terme «puissance moyenne» est difficile ainsi, par conséquent, que la mesure de cette puissance;

e) Que le CCIR, bien qu'il étudie cette question, n'a pas encore émis des Avis appropriés concernant l'appendice 8 dans le cas des bandes de fréquences supérieures à 960 MHz;

f) Que les rayonnements non essentiels d'émetteurs fonctionnant dans des stations spatiales peuvent causer des brouillages préjudiciables, notamment par les composantes d'intermodulation d'amplificateurs à large bande qui ne peuvent être réglées aprés le lancement;

g) Que les rayonnements non essentiels de stations terriennes nécessitent aussi des études spéciales;

h) Que le CCIR n'a pas publié de renseignements concernant les rayonnements non essentiels de stations utilisant des techniques de modulation numériques et fonctionnant dans des bandes fréquences supérieurs à 960 MHz;

notant

la très forte utilisation du spectre radioélectrique au-dessus de 960 MHz dans les grandes zones urbaines et le développement rapide de cette utilisation qui s'effectue actuellement surtout au-dessus de 10 GHz;

recommande que le CCIR

1. Étudie d'urgence la question des rayonnements non essentiels résultant des émissions de services spatiaux et élabore, sur la base de ces études, des Avis concernant les niveaux maximaux tolérés des rayonnements non essentiels exprimés en puissance moyenne des composantes non essentielles fournies par l'émetteur à la ligne d'alimentation de l'antenne;

2. Poursuive l'étude des niveaux des rayonnements non essentiels dans toutes les bandes de fréquences, en insistant sur les bandes de fréquences, les services et les techniques de modulation qui ne sont pas actuellement traités dans l'appendice 8;

3. Établisse des techniques de mesure appropriées pour les rayonnements non essentiels incluant la détermination de niveaux de référence pour les transmissions à large bande ainsi que la possibilité d'application de largeurs de bande de référene pour les mesures;

4. Étudie la catégorisation des émissions et des rayonnements nons essentiels d'après leur «puissance moyenne» et élabore des Avis appropriés pour faciliter l'interprétation de ce terme et la mesure de la puissance moyenne pour les différentes catégories d'émission.

YH RECOMMANDATION N° 67

Relative à la définition des termes «zone de service» et «zone de couverture»

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que dans les textes officiels de l'UIT on rencontre souvent les termes «zone de service» et «zone de couverture»;

b) Que ces deux termes sont utilisés avec le même sens ou des sens différents, selon les divers services de radiocommunication;

c) Qu'il n'existe pas de définition des termes «zone de service» et «zone de couverture» dans l'article 1 du Règlement des radiocommunications;

notant

a) Que le terme «zone de service» est déjà employé dans les textes des appendices 1, 3, 4, 5 et 25 Mar2 du Règlement des radiocommunications;

b) Qu'il existe une définition de «zone de service» pour la radiodiffusion de Terre, dans l'Avis 499-1 du CCIR, basée sur le champ utilisable;

c) Qu'une définition très semblable à celle de l'Avis 499-1 figure à l'annexe 2 des Actes finals de la Conférence administrative régionale de radiodiffusion à ondes kilométriques et hectométriques (Régions 1 et 3) (Génève, 1975);

d) Qu'une définition de «zone de service» pour la radiodiffusion par satellite figure à annexe 8 des Actes finals de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977). Cette définition est de nature administrative. Elle est accompagnée d'une note technique, dans laquelle on se référe à une puissance surfacique appropriée et à une protection contre les brouilleurs basée sur un rapport de protection convenu;

e) Que des aspects techniques et administratifs sont quelquefois compris dans la définition de la «zone de service» et qu'ils ne peuvent pas être séparés aisément;

f) Qu'une définition de «zone de couverture» pour la radiodiffusion par satellite, basée sur le niveau de puisance surfacique qui assure, en l'absence, de brouillage, une qualité de récption spécifiée, figure à l'annexe 8 precitée;

reconnaissant

que les définitions existantes de «zone de service» et «zone de couverture» sont liées définitions du champ utilisable ou de la puissance surfacique utilisable, soit en la présence, soit en l'absence de signaux brouilleurs;

invite le CCIR

1. À établir une définition générale de la «zone de couverture»;

2. À établir les bases techniques d'une définition générale de la «zone de service» qui tienne compte de la présente utilisation de ce terme dans tous les textes officiels de l'UIT en vue de permettre à de futures conférences administratives de déterminer des aspects administratifs de cette définition.

E

RECOMMANDATION N° 68

Relative aux études et à la prévision de la propagation et des bruits radioélectriques (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que l'utilisation efficace des fréquences radioélectriques dépend de l'emploi des données et normes techniques les plus sûres, surtout dans les parties du spectre qui sont les plus encombrées;
b) Que l'on peut faciliter la satisfaction de nouveaux besoins en fréquences et le développement des services de radiocommunication en améliorant partout où c'est nécessaire les Normes techniques actuellement employées par l'IFRB;
c) Que l'ancien appendice A du Règlement des radiocommunications (édition de 1968), intitulé «Étude et prévision de la propagation et des bruits radioélectriques» reconnaissait que l'importance des données sur la propagation et les bruits radioélectriques est déterminante pour l'utilisation optimale des fréquences et l'établissement de plans efficaces pour les services de radiocommunication;
d) Que cet appendice avait pour objectif principal l'établissement et le fonctionnement de systèmes mondiaux de stations d'observation, afin d'obtenir des données sur les bruits radioélectriques et sur les phénomènes ionosphériques, troposphériques et autres qui influencent la propagation des ondes;
e) Que les administrations prennent les dispositions les plus appropriées pour étudier, coordonner et diffuser rapidement ces données et les prévisions relatives à ces données, et qu'elles s'efforcent également de promouvoir les études sur la propagation et sur les bruits radioélectriques par l'intermédiaire du CCIR;
f) Que le CCIR a adopté des programmes d'études qui traitent d'un grand nombre de ces problèmes;
g) Que, dans certaines parties du monde, aucune mesure de la propagation et des bruits radioélectriques n'a été effectuée;

demande au CCIR

1. D'encourager et d'aider à entreprendre l'étude de la propagation et des bruits radioélectriques dans les régions qui ne sont pas encore dotées d'un système approprié de station d'observation;
2. De continuer l'étude de la propagation et des bruits radioélectriques et de prendre les mesures nécessaires en vue de coordonner les résultats obtenus dans différents pays;
3. D'accorder une attention particulière à ces études qui aideront l'IFRB à améliorer encore les Normes techniques employées par ce Comité;
4. De fournir régulièrement des rapports sur ces questions, même si les études ne sont pas achevées;
5. De continuer à consulter régulièrement les autres organisations qui effectuent des études sur la propagation et les bruits radioélectriques, par exemple l'Union radioscientifique internationale, afin de réaliser une coordination aussi large que possible;

recommande aux administrations

1. D'entreprendre l'étude de la propagation et des bruits radioélectriques dans les régions qui ne sont pas encore dotées d'un système approprié de stations d'observation et d'en communiquer les résultats au CCIR;
2. De continuer à favoriser l'établissement et le fonctionnement d'un système mondial de stations d'observation afin d'obtenir des données sur les bruits radioélectriques et sur les phénomènes ionosphériques, troposphériques et autres qui influencent la propagation des ondes;
3. De continuer à prendre les dispositions les plus appropriées pour étudier, coordonner te diffuser rapidement ces données et les prévisions relatives à ces données;
4. De tenir compte, dans l'établissement et la mise en œuvre de leurs programmes de travaux sur la propagation et les bruits radioélectriques, des Avis, Rapports, Questions et Programmes d'études du CCIR s'appliquant à ces problèmes notamment des résultats déjà obtenus, des plans établis pour les études futures et des modes de présentation recommandés dans ces documents.

P

RECOMMANDATION N° 69

Relative aux tolérances de fréquence des émetteurs (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

---

(1) Remplace la Recommandation N.º 4 de la Conférence administrative des radiocommunications (Génève, 1959).
(2) Remplace la Recommandation N° 7 de la Conférence administrative des radiocommunications (Génève, 1959).

considérant

a) Que l'appendice 7 ao Règlement des radiocommunications spécifie les tolérances de fréquence à respecter par les émetteurs;
b) Que le principal objectif de cet appendice a été de diminiuer la fraction du spectre des fréquences nécessaire pour chaque voie, par le jeu d'une réduction des tolérances de fréquence, et que, dans bien des cas il est encore possible d'obtenir une amélioration considérable dans l'utilisation du spectre, grâce à une nouvelle réduction des tolérances de fréquence;
c) Qu'en améliorant, dans divers services, la tolérance de fréquence pour la porter à la valuer la plus stricte qu'il est possible d'atteindre en l'état de la technique, on pourrait augmenter le rapport signal/bruit, améliorer l'intelligibilité et réduire les erreurs;
d) Que, dans certains cas, une tolérance de fréquence plus stricte n'augmenterait pas, en pratique, le nombre des voies disponibles;
e) Que, dans certaines bandes de fréquences, les tolérances spécifiées à l'appendice 7 se rapprochent peut-être déjà de la valeur minimum utilisable pour certaines catégories de stations, lorsqu'elles appliquent les techniques et les méthodes d'exploitation actuelles;
f) Qu'il sera d'un très grand secours pour les administrations, lorsqu'elles auront à planifier leurs services et à s'équiper en matériel, de connaître des tolérances de fréquence qui peuvent être considérées comme la valeur limite minimum utilisable pour les stations, lorsqu'elles appliquent les tecnhiques et les méthodes d'exploitation actuelles;
g) Que, dans certains cas, l'obtention d'une tolérance de fréquence plus stricte est soumise à des restrictions d'ordre économique qu'il convient de connaître et don il convient de tenir compte;

invite le CCIR

1. À poursuivre l'étude des tolérances de fréquence en vue de réduire la fraction du spectre des fréquences nécessaire pour une voie donnée;
2. À considérer si, dans certains cas, il est ou non possible de prévoir des valeurs de tolérance limites qu'il ne serait pas nécessaire de rendre plus strictes dans les conditions d'exploitation actuellement connues, et de préciser quelles pourraient être ces valeurs;
3. À faire un rapport sur la possibilité d'atteindre ces valeurs limites, compte tenu des impératifs économiques et de conception et d'autres considérations pratiques;
4. À indiquer, s'il y a lieu, celles des tolérances spécifiées à l'appendice 7 qui ont déjà atteint ces valeurs limites.

S

RECOMMANDATION Nº 70

Relative à l'étude des caractéristiques technhiques du matériel (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

reconnaisant

que les renseignements techniques dont on dispose sur les divers types d'appareils utilisés pour la réception des différentes classes d'émission dans les différents services doivent être encore plus complets et plus précis pour pouvoir établir les plans les plus efficaces pour l'utilisation du spectre des fréquences radioélectriques;

invite le CCIR

1. À poursuivre sus études sur les caractéristiques qui devraient présenter les divers types d'appareils utilisés pour la réception des différentes classes d'émission dans les différents services en ce qui concerne la largeur de bande, la sélectivité, la sensibilité et la stabilité, et à formuler des Avis à ce sujet;
2. À poursuivre l'étude des méthodes pratique permettant d'obtenir les caractéristiques recommandées;
3. À étudier l'écart minimal pratiquement réalisable entre voies adjacentes en considérant les différentes classes d'emission, les différents services et les différentes bandes de fréquences;
4. À étudier les autres conditions auxquelles il est désirable que satisfassent dans leur ensemble les systèmes employés par les différents services, en vue de déterminer les conditions techniques auxquelles doit satisfaire le matériel, y compris l'appareillage terminal des stations et les antennes;
5. À étudier les méthodes permettant de déterminer si le matériel satisfait aux conditions recommandées;
6. À accorder une attention particulière aux études qui aideront le Comité international d'enregistrement des fréquences à améliorer encorre les Normes techniques qu'il emploie.

---

(1) Remplace la Recommandation Nº 6 de la Conférence administrative des radiocommunications (Génève, 1959).

ZN RECOMMANDATION Nº 71

Relative à la normalisation des caractéristiques techniques et d'exploitation des matériels radioélectriques

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les administrations se trouvent confrontées à la nécessité de consacrer de plus en plus de ressources à le réglementation de la qualité de fonctionnement des matériels radioélectriques;
b) Que les administrations, en particulier celles des pays en développement des difficultés à obtenir ces ressources;
c) Quil y aurait avantage à appliquer, dans toute la mesure pratiquement possible, des normes mutuellement reconnues ainsi que les procédures d'homologation associées;
d) Qu'un certain nombre d'organismes internationaux, dont le CCIR, l'OACI, l'OMCI, le CISPR et la CEI établissent des recommandations et des normes concernant les caractéristiques techiniques et d'exploitationl applicables à la qualité de fonctionnemtn des matériels et à la mesure de cette qualité;
e) Que, dans ce domaine, les besoins spécifiques des pays en développement n'ont pas toujours été pleinement pris en considération;

recommande

1. Que les administrations s'efforcent de coopérer en vue d'établir des spécifications internationales de qualité de fonctionnement et les méthodes de mesure associées qui pourraient être utulisées comme modèles pour les normes nationales applicables aux matériels radioélectriques;
2. Que ces spécifications internationales de qualité de fonctionnement et les méthodes de mesure associées répondent à des conditions largement représentatives ainsi qu'aux besoins spécifiques des pays en développement;
3. Que, lorsqu'il existe de telles spécifications internationales de qualité de fonctionnement pour les matériels radioélectriques, les administrations adoptent, dans toute la mesure pratiquement possible, ces spécifications comme vase pour leurs normes nationales;
4. Que les administrations envisagent dans toute la mesure pratiquement possible l'acceptation mutuelle des procédures d'homologation pour les matériels conformes à ces spéfications de qualité de fonctionnement.

ZR RECOMMANDATION Nº 72

Relative à la terminologie

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les discussions relatives à certains termes et définitions techniques figurant à l'article 1 ont fait apparaître divers problèmes qui n'ont pas été résolus de façon, entièrement satisfaisante au cours de ladite Conférence;
b) Que l'évolution de la technique et des modes d'expression peut conduire à ajourter, modifier on éventuellement supprimer certaines définitions;

invite le CCIR et le CCITT

chacun dans son domaine propre, à examiner les définitions des termes techniques figurant dans l'article 1 et à proposer toute modification qu'ils jugent utile;

charge le Secrétaire général

de transmettre les propositions élaborées par ces deux organismes aux conférences administratives intéressées pour que ces dernières les prennent en considération dans le cadre de leur mandat.

J RECOMMANDATION Nº 73

Relative à l'emploi du terme «canal» dans le Règlement des radiocommunications

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le terme «voie» (en anglais: channel, en espagnol: «canal») est utilisé très largement dans le Règlement des radiocommunications pour les plans d'allotissement des fréquences dans les appendices 16, 18, 25 Mar2, 26, 27, 27 Aer2, 32, 33 et 34 (1);

b) Que le terme «canal» (en anglais: channel, en espagnol: «canal») a des sens différents dans d'autres dispositions du Règlement des radiocommunications et pour les différents services de radiocommunication;

c) Qu'il ne doit y avoir aucune ambiguïté au sujet du sens du terme «canal» lors de son emploi dans les textes du Règlement des radiocommunications;

invite le CCIR

à définir le terme «canal» de façon qu'il puisse être utilisé de manière cohérente et sans confusion dans les textes du Règlement des radiocommunications pour toutes les langues de travail de l'UIT.

ZO

RECOMMANDATION N° 74

Relative à l'emploi du système international d'unités (SI) (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le système SI permet de résoudre de nombreux problèmes que posent les systèmes d'unités plus anciens;

b) Que l'Organisation internationale de normalisation e approuvé le système SI et en recommande l'adoption générale;

reconnaissant

a) Que le système SI, déjà adopté par nombre d'organisations internationales, est recommandé par le CCIR et le CCITT et utilisé par le CCIR et par les organismes permanents de l'Union;

b) Que le système SI a statut de norme nationale dans de nombreux pays;

c) Que, dans les pays qui n'ont pas encore adopté le système SI comme norme nationale, les ingénieurs des radiocommunications, les scientifiques et les auteurs de publications relatives à la radioélectricité recourent très souvent à ce système;

d) Que l'emploi du système SI ne fait que s'étendre dans toutes les parties du monde;

recommande

que les administrations utilisent le système SI dans leurs relations avec l'Union et les organismes qui la composent.

YX

RECOMMANDATION N° 100

Relative aux bandes de fréquences préférentielles pour les systèmes qui utilisent la propagation par diffusion troposphérique

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la Conférence administrative mondiale des radiocommunications spatiales (Génève, 1971) a demandé au CCIR d'étudier les bandes de fréquences préférentielles pour les systèmes de diffusion troposphérique et qu'elle a invité une future conférence administrative mondiale des radiocommunications à examiner cette question;

b) Les difficultés techniques et d'exploitation mentionnées par le CCIR (rapport de la Réunion spéciale préparatoire, Génève, 1978) dans les bandes de fréquences utilisées en partage par les systèmes à diffusion troposphérique, les systèmes spatiaux et les autres systèmes de Terre;

c) Les attributions additionnelles de bandes de fréquences qui ont été faites par la présente Conférence aux services spatiaux pour tenir compte de leur développement croissant;

d) Que l'IFRB a besoin que les administrations lui fournissent des renseignements spécifiques sur les systèmes qui utilisent la diffusion troposphérique, pour pouvoir s'assurer que les dispositions pertinentes du Règlement des radiocommunications (par exemple, le renvoi **763**, et les numéros **2560** et **2564** ont été appliquées;

---

(1) Le terme «voie» est actuellement utilisé en français dans ces appendices, mais on pourrait éventuellement envisager son remplacement ultérieur par le terme «canal», en tenant compte de la définition de ce terme qu'établira le CCIR.

(2) Remplace la Recommandation N° 9 de la Conférence administrative des radiocommunications (Génève, 1959).

reconnaissant toutefois

que les administrations voudront continuer à utiliser des systèmes à diffusion troposphérique pour répondre à certains besoins des télécommunications;

notant

que la prolifération de ces systèmes dans toutes les bandes de fréquences, en particulier dans celles qui sont utilisées en partage avec les systèmes spatiaux, ne fera qu'aggraver une situation déjà difficile;

recommande au CCIR

1. De poursuivre d'urgence l'étude des bandes de fréquences possédant les caractéristiques les mieux adaptées du point de vue de la propagation, aux systèmes qui utilisent la diffusion troposphérique;
2. De poursuivre l'étude des possibilités et des critères de partage entre les systèmes qui utilisent la diffusion troposphérique et les autres systèmes, en particulier les systèmes spatiaux;
3. D'élaborer, à la suite des études susmentionnées, un Avis relatif aux bandes de fréquences spécifiques qui ont été jugées les plus satisfaisantes pour de tels systèmes et cela, si possible avant sa prochaine Assemblée plénière. Ces bandes de fréquences devront être définies compte tenu des attributions à d'autres services, en particulier des attributions aux services spatiaux;

recommande aux administrations

1. De collaborer d'urgence et dans la mesure de leurs possibilités avec le CCIR en lui envoyant des contributions portant sur les études susmentionnées;
2. De tenir compte, pour assigner des fréquences aux nouvelles stations des systèmes qui utilisent la diffusion troposphérique, des renseignements publiés jusqu'à présent par le CCIR, afin que les systèmes qui seront établis à l'avenir emploient un nombre limité de bandes de fréquences déterminées;
3. D'indiquer explicitement dans les fiches de notification des assignations de fréquence qu'elles envoient à l'IFRB si ces assignations correspondent à des stations de systèmes à diffusion troposphérique;

invite le Conseil d'administration

à adopter les dispositions nécessaires pour qu'une future conférence administrative mondiale des radiocommunications examine les bandes de fréquences du service fixe à attribuer de préférence aux nouveaux systèmes utilisant la propagation par diffusion troposphérique, compte tenu des attributions de fréquence au service de radiocommunication spatiale et des Avis élaborés à cet effet par le CCIR.

ZE RECOMMANDATION N° 101

Relative aux liaisons de connexion dans le service de radiodiffusion par satellite (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il est nécessaire de disposer d'une documentation abondante sur les caractéristiques des liaisons de connexion pour la planification du service de radiodiffusion par satellite;
b) Que le CCIR poursuit l'étude de ce problème au titre du Programme d'études pertinent;
c) Que les rapports porteuse/bruit sur les liaisons de connexion vers les satellites de radiodiffusion devraient avoir des valeurs de l'ordre de dix fois supérieures à celles des liaisons descendantes;
d) Qu'en ce qui concerne le brouillage sur les liaisons de connexion entre des satellites de radiodiffusion occupant des emplacements différents sur l'orbite, des rapports de protection sur les liaisons montantes (supérieurs d'environ 10 dB aux rapports de protection sur les liaisons descendantes) semblent pouvoir être aisément obtenus par la discrimination du diagramme des antennes d'émission des stations terriennes, dont le diamètre devra, bien entendu, être supérieur à celui des antennes de réception utilisées pour la liaison descendante;
e) Que, lorsque la planification est basée sur des paramètres de séparation tels que diagrammes de rayonnement pour les antennes d'émission des stations spatiales, entrelacement des porteuses ou discrimination de polarisation ou des deux paramètres, dans le but d'obtenir, sur la liaison descendante, le rapport porteuse/brouillage requis entre les zones de service desservies à partir d'un même emplacement sur orbite, le rapport porteuse/brouillage plus élevé à prévoir sur les liaisons montantes qui aboutissent à la ou aux stations spatiales occupant cet emplacement doit être obtenu au moyen des mêmes paramètres de séparation, à condition que ce rapport permette d'améliorer la séparation nette d'environ 10 dB. Les caractéristiques de la station terrienne d'émission n'influent naturellement pas sur cette séparation, sauf en ce qui concerne la pureté de la polarisation dans l'axe du faisceau;

(1) Remplace la Recommandation N° Sat-5 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

f) Que, pour la mise en œuvre effective des systèmes de radiodiffusion par satellite, il faut tenir compte de toutes les fonctions connexes des satellites d'exploitation spatiale (poursuite, télémesure, télécommande et mesure des distances) liées au fonctionnement des stations spatiales de radiodiffusion;

invite le CCIR

1. À poursuivre, pour les antennes de réception des stations spatiales du service de radiodiffusion par satellite, l'étude des caractéristiques de rayonnement qui permettent d'obtenir par elles-mêmes, ou combinées à d'autres moyens de discrimination, les rapports de protection nécessaires sur les liaisons de connexion des systèmes du service de radiodiffusion par satellite, pour les émissions de la ou des stations spatiales occupant une position donnée sur l'orbite des satellites géostationnaires;

2. À poursuivre, pour les antennes de réception des stations spatiales du service de radiodiffusion par satellite, l'étude des caractéristiques de polarisation qui permettent d'obtenir par elles-mêmes, ou combinées à d'autres moyens de discrimination, les rapports de protection nécessaires sur les liaisons de connexion des systèmes du service de radiodiffusion par satellite, pour les émissions de la ou des stations spatiales occupant une position donnée sur l'orbite des satellites géostationnaires;

3. À poursuivre l'étude des caractéristiques techniques des liaisons de connexion qui doivent être prises en considération lors de la mise en œuvre du Plan pour ce service;

4. À l'étudier les caractéristiques et les conditions techniques et de conception qui influent sur la mise en œuvre des «fonctions des services d'exploitation spatiale» des stations spatiales du service de radiodiffusion par satellite;

5. À étudier les conditions requises pour la séparation des canaux adjacents sur les liaisons de connexion vers la ou les stations spatiales du service de radiodiffusion par satellite occupant une position donnée sur l'orbite des satellites géostationnaires.

X RECOMMANDATION Nº 102

Relative à l'étude des méthodes de modulation pour les faisceaux hertziens du point de vue du partage des bandes de fréquences avec les systèmes du service fixe par satellite (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que, d'après l'article 8 du Règlement des radiocommunications, certaines bandes de fréquences peuvent être utilisées en partage par le service fixe par satellite et par le service fixe;

b) Que les articles 27 et 28 du Règlement des radiocommunications fixent les critères de partage qu'il y a lieu de respecter afin d'éviter les brouillages mutuels entre les stations de ces deux services;

c) Que la réduction des brouillages entre deux services semble être le plus important des nombreux facteurs dont dépend l'efficacité de l'utilisation des bandes de fréquences;

notant

a) Que l'efficacité de l'utilisation des bandes de fréquences partagées par ces deux services dépend des méthodes de modulation utilisées dans les systèmes intéressés;

b) Que l'étude des caractéristiques de modulation préférées pour les systèmes du service fixe par satellite est prévue dans le Programme d'études 2D-1/4 du CCIR;

recommande que le CCIR

étudie spécialement, dans le cadre de la Question 2-3/4, les méthodes de modulation (comme la modulation par impulsions codées utilisée avec la modulation de phase ou de fréquence), en particulier pour les faisceaux hertziens en visibilité directe, du point de vue du partage des bandes de fréquences avec les systèmes du service fixe par satellite.

ZA RECOMMANDATION Nº 103

Relative à la dispersion de l'énergie de la porteuse dans les systèmes du service fixe par satellite (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que l'utilisation de techniques de dispersion de l'énergie de la porteuse dans les systèmes du service fixe par satellite peut conduire à une réduction sensible des brouillages causés aux stations d'un service de radiocommunication de Terre qui fonctionnent dans les mêmes bandes de fréquences;

---

(1) Remplace la Recommandation Nº Spa-4 de la Conférence administrative extraordinaire des radiocommunications (Génève, 1963).
(2) Remplace la Recommandation Nº Spa2-11 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

b) Que l'utilisation de ces techniques peut conduire à une réduction sensible des brouillages entre systèmes du service fixe par satellite fonctionnant dans les mêmes bandes de fréquences et à une augmentation correspondante de l'efficacité d'utilisation de l'orbite des satélites géostationnaires;
c) Que ces techniques sont couramment utilisées avec succés dans les systèmes du service fixe par satellite sans dégradation sensible de la qualité de fonctionnement;

recommande

1. Que les systèmes du service fixe par satellite employant une modulation angulaire par des signaux analogiques utilisent, dans la mesure où cela est pratiquement possible, des techniques de dispersion de l'énergie de la porteuse afin d'étaler à tout moment l'énergie d'une façon compatible avec un fonctionnement satisfaisant de ces systèmes;
2. Que les systèmes du service fixe par satellite employant une modulation numérique utilisent des techniques de dispersion de l'énergie de la porteuse lorsque cela sera devenu possible des points de vue techniques et pratique.

ZZ

RECOMMANDATION Nº 200

Relative à la date d'entrée en vigueur de la bande de garde de 10 kHz pour la fréquence 500 kHz dans le service mobile (détresse et appel)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il est nécessaire d'utiliser le spectre des fréquences de la façon la plus efficace possible;
b) Que la présente Conférence a adopté une bande de garde de 495 kHz à 505 kHz pour la fréquence 500 kHz, qui est la fréquence internationale d'appel et de détresse en radiotélégraphie dans le service mobile;

reconnaissant

a) Qu'il est nécessaire de prévoir un délai suffisant d'amortissement pour les matériels radioélectriques actuellement en service;
b) Que les progrès de la technique ont permis la réalisation de matériels plus stables et plus fiables;

recommande

à la prochaine conférence administrative mondiale des radiocommunications compétente de prendre une décision sur la date d'entrée en vigueur de cette nouvelle disposition;

demande au Secrétaire général

de communiquer la présente Recommandation à l'Organisation intergouvernementale consultative de la navigation maritime (OMCI) en la priant d'inclure l'examen de ce sujet dans le cadre de l'étude du système de détresse et de sécurité maritime et de soumettre à la conférence mentionnée ci-dessus une recommandation relative à la date d'entrée en vigueur de la nouvelle bande de garde.

YS

RECOMMANDATION Nº 201

Relative au trafic de détresse, d'urgence et de sécurité (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

ayant noté

que l'Organisation intergouvernementale consultive de la navigation maritime (OMCI):

a) A adopté une résolution (2) au sujet du système de détresse maritime;
b) Développe un futur système mondial de détresse et de sécurité maritime comportant des améliorations à court terme qui ont été proposées et la définition des besoins et des mesures transitoires proposées en vue d'une amélioration à long terme;

prenant note d'autre part

que les études ayant trait aux mesures à prendre pour la détresse et la sécurité dans le cadre d'un système de radiocommunications maritimes par satellite font l'objet de Questions et de Programmes d'études du CCIR;

---

(1) Remplace la Recommandation Nº Mar2-16 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).
(2) Résolution A.420 (XI) de l'OMCI.

considérant

a) L'importance particulière du besoin, souligné par l'OMCI, d'un système qui transmettrait automatiquement, en cas de détresse, des signaux d'alarme, suivis de la transmission, également automatique, de renseignements supplémentaires concernant le cas de détresse;
b) Qu'il convient que l'alarme automatique en cas de détresse, suivie de la transmission automatique de renseignements supplémentaires concernant le cas de détresse, ait lieu sur une ou, plusieurs fréquences réservées à des fins de détresse;
c) Qu'il faut prévoir des fréquences appropriées aux besoins connexes en matière d'appel et de communications de sécurité;
d) Que l'émission des messages de détresse, d'urgence et de sécurité et leur enregistrement à la réception doivent pouvoir s'effectuer sans interruption, que les stations intéressées fonctionnent ou non sous la surveillance de personnel;

recommande

1. Que l'OMCI soit invitée à poursuivre ses études afin de parvenir à la mise en œuvre prochaine du futur système de détresse;
2. Que le CCIR poursuive ses travaux en vue de déterminer le rôle des radiocommunications maritimes par satellite aussi bien dans le cadre d'un système de détresse coordonné que pour la sécurité;
3. Que les administrations, en tenant compte des progrés continuels de la technologie, envisagent la nécessité de réserver une ou, éventuellement, plusieurs fréquences à des fins de détresse;
4. Que les administrations, en s'inspirant des progrés techniques, envisagent une automatisation plus poussée des systèmes de télécommunications permettant de diffuser sans interruption les messages de détresse, d'urgence et de sécurité, en vue de remplacer la radiotélégraphie en code Morse et, éventuellement, la radiotéléphonie;
5. Que les administrations se fixent comme objectif de prendre une décision en la matière lors de la prochaine conférence administrative mondiale des radiocommunications compétente.

F RECOMMANDATION N° 202

Relative à l'amélioration de la protection, contre les brouillages préjudiciables, des fréquences de détresse et de sécurité et de celles qui ont un rapport avec la détresse et la sécurité

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il importe de réduire au minimun les risques de brouillages préjudiciables sur les fréquences utilisées pour la sauvegarde de la vie humaine;
b) Que cette Conférence, lorsqu'elle a examiné l'article 18 relatif aux brouillages, a reconnu à l'unanimité qu'il convient d'améliorer la protection, contre les brouillages préjudiciables, des fréquences de détresse et de sécurité et de celles qui ont un rapport avec la détresse et la sécurité;
c) Que l'on pourrait notamment contribuer à l'amélioration de cette protection en insérant dans le Règlement des radiocommunications des dispositions stipulant que les essais sur ces fréquences doivent être effectués, chaque fois que pratiquement possible, à l'aide d'une antenne fictive ou avec une puissance réduite;
d) Que ces dispositions sont contenues dans l'article 38 relatif aux fréquences de détresse et de sécurité;

notant cependant

que la présente Conférence n'est pas habilitée à réviser l'article 38;

invite les administrations

à étudier cette question et à soumettre des propositions à la prochaine conférence administrative mondiale des radiocommunications compétente.

YA RECOMMANDATION N° 203

Relative à l'utilisation future de la bande 2170-2194 kHz

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la fréquence 2182 kHz est la fréquence internationale de détresse en radiotéléphonie;
b) Que, exception faite des émissions autorisées sur la fréquence porteuse 2182 kHz, toute émission est interdite sur les fréquences comprises entre 2173,5 kHz et 2190,5 kHz;

c) Que, dans la Région 1, les bandes de fréquences adjacentes 2170-2173,5 kHz et 2190,5-2194 kHz sont utilisées respectivement par les stations côtières appelant des stations de navire (y compris les appels sélectifs) et par les stations de navire appelant les stations côtières;

notant

a) Que la présente Conférence a modifié le Tableau d'attribution des bandes de fréquences pour réduire la bande de garde autour de la fréquence 2182 kHz à ± 8,5 kHz et qu'elle a attribué les bandes 2170-2173,5 kHz et 2190,5-2194 kHz en exclusivité au service mobile maritime dans le monde entier;
b) Qu'il est maintenant nécessaire de réorganiser l'ensemble de la bande 2170-2194 kHz et de réexaminer les dispositions réglementaires, surtout en ce qui concerne les articles 38 et 60;

recommande

que la prochaine conférence administrative mondiale des radiocommunications compétente soit invitée:

1. À examiner les attributions à l'intérieur de la bande 2170-2194 kHz;
2. À revoir les paramètres techniques et d'exploitation appropriès en vue de réduire encore davantage la bande de garde autour de la fréquence 2182 kHz;
3. À mettre au point toutes dispositions réglementaires éventuellement nécessaires;
4. À elaborer sur ces bases des plants pour la mise en œuvre de toute nouvelle disposition;
5. À fixer la date d'entrée en vigueur de ces plans et de ces dispositions;

demande au Secrétaire général

de communiquer la présente Recommandation au Secrétaire général de l'Organisation intergouvernementale consultive de la navigation maritime (OMCI) pour qu'elle soit étudiée par les organes compétents et que ceux-ci formulent des recommandations à ce sujet;

invite

les administrations à étudier cette question et à présenter des propositions pour examen par la prochaine conférence administrative mondiale des radiocommunications compétente.

C

RECOMMANDATION N° 204

Relative à l'application des chapitres NX, NXI et NXII du Remaniement du Règlement des radiocommunications (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le Règlement des radiocommunications constitue le cadre réglementaire fondamental pour tous les services mobiles et que ses dispositions doivent répondre, d'aussi près que possible, aux besoins et aux conditions d'exploitation pratiques de ces services;
b) Que le présente Conférence a adopté le Remaniement du Règlement des radiocommunications proposé par le Goupe d'Experts, compte tenu des propositions formulées par un certain nombre d'administrations en vue d'une amélioration de ce Remaniement;
c) Que la subdivision des précédentes dispositions relatives au service mobile en plusieurs chapitres correspondant aux divers services mobiles a fait apparaître certaines anomalies à propos de ces services, s'agissant en particulier de leur applicabilité au service mobile aéronautique et au service mobile terrestre;
d) Que certaines de ces anomalies soulèvent des problèmes fondamentaux d'exploitation qui ne sont pas de la compétence de la présente Conférence;
e) Que le service mobile aéronautique a pour objet les communications devant assurer une exploitation súre et régulière des aéronefs;
f) Qu'à cet effet, l'Organisation de l'aviation civile internationale a approuvé des normes et pratiques recommandées adaptées aux besoins de l'exploitation des aéronefs, lesquelles ont fait leurs preuves dans la pratique et sont aujourd'hui d'un usage courant;

recommande

que la prochaine conférence administrative mondiale des radiocommunications compétente révise les chapitres NX, NXI et NXII (1) afin de les adapter aux besoins et aux pratiques actuels des services concernés;

---

(1) Chapitres X, XI et XII du Règlement des radiocommunications de 1979.

prie le Secrétaire général

de communiquer le texte de la présente Recommandation à l'OACI et à l'OMCI et d'attirer l'attention de ces organisations sur l'étude du contenu des chapitres NX et NXI (1) respectivement en vue d'assister les administrations pour la préparation de cette conférence.

YD RECOMMANDATION N° 300

Relative à la planification de l'utilisation des fréquences par le service mobile maritime dans la bande 435-526,5 kHz dans la Région 1

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la présente Conférence a modifié les attributions au service mobile maritime dans la bande 415-526,5 kHz;
b) Que la présente Conférence a adopté les Recommandations **200** et **309** relatives à cette bande;
c) Que la présente Conférence a révisé certaines normes techniques utilisées dans le service mobile maritime:
d) Que certains des normes techniques qui ont servi de base au plan d'assignations pour les pays européens contenu dans les Actes finals de la Conférence maritime européenne (Copenhague, 1948) sont maintenant dépassées;
e) Que les navires qui utilisent les fréquences de cette bande naviguent dans le monde entier;
f) Que certains pays ont déjà attribué des fréquences à d'autres services fonctionnant dans cette bande, ce qui peut imposer des contraintes pour la planification du service mobile maritime;
g) Qu'il est en conséquence nécessaire d'examiner en détail l'utilisation et la planification de cette bande en tenant compte des normes et des progrès techniques les plus récents;

notant

que la présente Conférence a recommandé de convoquer une conférence administrative des radiocommunications pour les services mobiles;

recommande au Conseil d'administration

de veiller à ce que la conférence pour les services mobiles soit compétente pour prendre des décisions à propos de la planification et de l'utilisation des fréquences de cette bande dans la Région 1;

demande au CCIR

d'entreprendre, d'urgence, l'étude des aspects techniques et d'exploitation de ces problèmes, y compris les critères de partage avec d'autres services;

invite

1. Le Secrétaire général à communiquer la présente Recommandation à l'Organisation intergouvernementale consultive de la navigation maritime (OMCI) en la priant d'examiner d'urgence les besoins d'exploitation du service mobile maritime qui utilise cette bande de fréquences, et de formuler les recommandations qu'elle juge appropriées;
2. Les administrations de la Région 1 à étudier cette question et à soumettre pour examen des propositions à la conférence pour les services mobiles.

YE RECOMMANDATION N° 301

Relative à la planification de l'utilisation des fréquences dans les bandes attribuées au service mobile maritime entre 1606,5 kHz et 3400 kHz dans la Région 1

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la présente Conférence a modifié les attributions au service mobile maritime dans les bandes comprises entre 1606,5 kHz et 3400 kHz;
b) Que la présente Conférence a adopté la Recommandation **203** et la Résolution **38** relatives à ces bandes;
c) Qu'il est souhaitable d'utiliser ces bandes de la façon la plus efficace lors de la mise en application du Tableau révisé d'attribution des bandes de fréquences;
d) Que les navires qui utilisent les fréquences de ces bandes naviguent dans le monde entier;
e) Que les plans existants sont limités à l'utilisation régionale;
f) Qu'il est en conséquence nécessaire d'examiner en détail l'utilisation et la planification de ces bandes;

(1) Chapitres X et XI du Règlement des radiocommunications de 1979.

notant

que la présente Conférence a recommandé de convoquer une conférence administrative des radiocommunications pour les services mobiles;

recommande au Conseil d'administration

de veiller à ce que la conférence pour les services mobiles soit compétente pour prendre des decisions a propos de la planification et de l'utilisation des fréquences de ces bnandes dans la Région 1;

demande au CCIR

d'entreprendre d'urgence, l'étude des aspects techniques et d'exploitation de ces problèmes, y compris les critères de partage avec d'autres services;

invite

1. Le Secrétaire général, à communiquer la présente Recommandation à l'Organisation intergouvernementale consultive de la navigation maritime (OMCI) en la priant d'examiner d'urgence les besoins d'exploitation du service mobile maritime qui utilise ces bandes de fréquences, et de formuler les recommandations qu'elle juge appropriées;

2. Les administrations de la Région 1, à étudier cette question et à soumettre pour examen des propositions à la conférence pour les services mobiles.

YM

RECOMMANDATION N° 302

Relative à une meilleure utilisation des voies radiotéléphoniques à ondes décamétriques par les stations côtières dans les bandes de fréquences attribuées en exclusivité au service mobile maritime (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'un grand nombre de demandes d'allotissements concernant des voies radiotéléphoniques à ondes décamétriques avaient été soumises à la Conférence administrative des radiocommunications maritimes (Génève, 1974);

b) Que le nombre de voies qui découle de la révision de l'appendice 16 ne suffit pas à répondre à ces demandes dans les meilleures conditions;

c) Que les modalités de portage qui en découlent ont été établies essentiellement en fonction de critères d'exploitation;

d) Qu'après la présent Conférence, il sera encore plus important d'assurer la meilleure utilisation possible des voies radiotéléphoniques à ondes décamétriques dans les bandes attribuées en exclusivité au service mobile maritime;

e) Qu'il convient que les administrations s'assurent les unes aux autres, dans chaque voie, une qualité de service équivalente;

f) Que l'on poursuit actuellement la mise au point de moyens techniques pour faciliter l'utilisation en commun des fréquences par les stations côtières voisines dépendant d'administrations différentes ou par une station côtière exploitée pour le compte de plusieurs administrations;

recommande aux administrations

1. De déployer tous leurs efforts en vue de conclure des arrangements d'exploitation mutuellement satisfaisants, concernant notamment:

Les différents schémas de partage dans le temps;
Le décalage des heures d'ouverture du service;
Volontairement et dans le cadre régional, l'utilisation des voies radiotéléphoniques à ondes décamétriques dans un ordre de priorité lié au volume du trafic;

2. D'utilisation tous les moyens à leur disposition, y compris ceux qui sont indiqués ci-dessus, pour permettre la meilleure utilisation possible des voies radiotéléphoniques à ondes décamétriques par les stations côtières dans les bandes attribuées au service mobile maritime;

invite les administrations

1. À tenir compte, lorsqu'elles assignent à des stations côtières des fréquences des bandes d'ondes décamétriques, des dispositions des numéros 954 et 1804 du Règlement des radiocommunications;

---

(1) Remplace la Recommandation N° Mar2-7 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

2. À faire en sorte que le stations côtières:

Utilisent la bande de fréquences et la puissance minimale adaptées aux conditions de propagation et à nature du service;

Utilisent chaque fois que cela est possible des antennes à effet directif;

Donnent aux stations de navire des instructions appropriées, comme il est indiqué au número **5056** du Règlement des radiocommunications;

invite le CCIR

à poursuivre ses études afin d'améliorer toues les critères de partage, techniques et d'exploitation, qui ont une incidence sur l'utilisation par les stations côtières des voies radiotéléphoniques à ondes décamétriques dans les bandes attribuées en exclusivité au service mobile maritime, ainsi que les méthodes de choix des voies disponibles par des moyens électroniques ou autres, on vue d'en faciliter l'accès multiple.

XJ RECOMMANDATION N.° 303

Relative à l'utilisation des fréquences porteuses 4125 kHz et 6215,5 kHz en plus de la fréquence porteuse 2182 kHz, aux fins de détresse et de sécurité ainsi que pour l'appel et la réponse dans la zone des Régions 1 et 2 située au sud du parallèle 15° N, y compris le Mexique, et dans la zone de la Région 3 située au sud du parallèle 25° N (1).

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que dans certaines zones du monde, il n'est pratiquement pas possible d'assurer une couverture fiable aux fins de détresse et de sécurité sur la fréquence international de détresse en radiotéléphonie (2182 kHz) parce que les stations côtières qui maintiennent la veille sur cette fréquence sont très éloignées les unes des autres;

b) Qu'un grand nombre de navires équipés seulement pour la radiotéléphonie croisent dans ces zones et sont alors souvent hors de portée des stations côtières qui assurent la veille sur la fréquence porteuse 2182 kHz;

c) Que pour surmonter cette difficulté, de nombreuses administrations des zones susmentionnées ont instauré dans leurs stations côtières des veilles sur les fréquences porteuses 4125 kHz et 6215,5 kHz aux fins de détresse et de sécurité ainsi que pour l'appel et la réponse; il est apparu que ces veilles complétent efficacement celle qui est effectuée sur la fréquence 2182 kHz;

d) Que le Règlement des radiocommunications prévoit la possibilité d'utiliser, aux fins de détresse et de sécurité ainsi que pour l'appel et la réponse, en plus de la fréquence porteuse 2182 kHz, d'une part la fréquence porteuse 4125 kHz dans la zone des Régions 1 et 2 située au sud du parallèle 15° N, y compris le Mexique, et dans la zone de la Région 3 située au sud du parallèle 25° N, d'autre part la fréquence porteuse 6215,5 kHz dans la zone de la Région 3 située au sud du parallèle 25° N;

e) Qu'il pourrait y avoir intérêt à ce que les navires équipés seulement pour la radiotéléphonie et qui naviguent dans ces zones aient les moyens d'émettre et de recevoir sur les fréquences porteuses 4125 kHz et 6125,5 kHz, lorsque les appels sur la fréquence 2182 kHz risquent d'être inefficaces;

recommande

1. Que les administrations fassent connaître aux exploitants des navires équipés seulement pour la radiotéléphonie et qui relèvent de leur juridiction, que certaines stations terrestres figurant dans la Nomenclature des stations côtières ont les moyens de compléter le service assuré sur la fréquence porteuse 2182 kHz aux fins de détresse et de sécurité ainsi que pour l'appel et la réponse, par un service fonctionnant sur la fréquence porteuse 4125 kHz dans la zone des Régions 1 et 2 située au sud du parallèle 15° N, y compris le Mexique, et dans la zone de la Région 3 située au sud du parallèle 25° N, et sur la fréquence porteuse 6215,5 kHz dans la zone de la Région 3 située au sud du parallèle 25° N;

2. Que les administrations dont certaines navires sont équipés seulement pour la radiotéléphonie ne perdent pas de vue que, s'il n'est pas obligatoire que les stations de navire et les stations côtières soient dotées d'installations permettant d'émettre et de recevoir sur les fréquences 4125 kHz et 6215,5 kHz, il n'en reste pas moins que de telles installations peuvent être essentielles à la sécurité de ces navires lorsqu'ils naviguent dans les zones susmentionnées.

---

(1) Remplace la Recommandation N° Mar2-4 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

YP RECOMMANDATION Nº 304

Relative aux fréquences de l'appendice 16 (section B) au Règlement des radiocommunications, destinées à être utilisées dans le monde entier par les navires de toutes catégories ainsi que par les stations côtières (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les fréquences indiquées dans la table des fréquences d'émission à bande latérale unique pour l'exploitation simplex (voie à une fréquence) et pour l'exploitation à bandes croisées entre navires (deux fréquences) ne sont pas encore utilisées à l'échelle mondiale pour les communications entre les navires et les stations côtières;
b) Que les navirers long-courriers, dans le monde entier, ont besoin de pouvoir communiquer avec les stations côtières de n'importe quelle administration;

recommande

que les administrations assurent, autant que possible, un service sur ces fréquences dans leurs principales stations côtières radiotéléphoniques et notifient au Secrétaire général des renseignements détaillés concernant ces services en vue de leur publication dans la Nomenclature des stations côtières.

ZW RECOMMANDATION Nº 305

Relative à utilisation des voies 15 et 17 de l'appendice 18 par les stations de communications de bord (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la Conférence administrative mondiale des radiocommunications (Génève, 1967) a prévu l'utilisation des voies 15 et 17 de l'appendice 18 pour les communications internes d'exploitation à bord des navires dans les eaux territoriales, avec une puissance apparente rayonnée ne dépassant pas 0,1 W, et que la Conferénce administrative mondiale des radiocommunications maritimes (Génève, 1974) a porté cette limite de puissance à 1 watt;
b) Qu'un certain nombre d'administrations font un grand usage de ces voies;
c) Que certaines administrations ne les ont pas utilisées pour les communications internes à bord des navires en raison du manque de voies à ondes métriques pour les autres besoins du service mobile maritime;
d) Que pour cette même raison, ces administrations désirent que ces voies cessent d'être utilisées pour les communications de bord;
e) Que, en la matière, la présente Conférence a maintenu les dispositions du Tableau d'attribution des bandes des fréquences;

notant

que le CCIR a adopté l'Avis 542 et le Rapport 589-1;

reconnaissant

a) Qu'il est nécessaire de disposer sur le plan international, de plusieurs voies communes pour les stations de communications de bord afin de pouvoir répondre aux besoins mondiaux dans l'avenir;
b) Qu'il peut être nécessaire de disposer de fréquences permettant d'utiliser des stations relais sur les grands navires tels que les porte-conteneurs, les bateaux-citernes, etc.;
c) Que l'on a peut-être besoin d'acquérir davantage d'expérience en ce qui concerne l'efficacité d'emploi des voies à ondes décimétriques maintenues disponibles à cet effet par la présent Conférence;

recommande

1. Que la prochaine conférence administrative mondiale des radiocommunications compétente détermine si l'utilisation des voies 15 et 17 de l'appendice 18 est encore nécessaire pour les communications de bord et, si tel n'est pas le cas, qu'elle fixe la date à laquelle il convient que cette utilisation cesse;

---

(1) Remplace la Recommandation Nº Mar2-6 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).
(2) Remplace la Recommandation Nº Mar2-11 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

2. Que cette même conférence examine le cas des voies à ondes décimétriques utilisées par les stations de communications de bord en vue de déterminer si leur mombre et leur emplacement dans le sprectre des fréquences répondent bien aux besoins de ces stations;

3. Que cette même conférence détermine s'il est nécessaire de procéder à des attributions supplémentaires de fréquences que les stations de communications de bord pourraient utiliser dans le monde entier, y compris dans les eaux territoriales de tous les pays;

4. Que les administrations accordent toute l'attention requise aux normes techniques de ces stations et à leur fonctionnement, afin d'assurer leur compatibilité mutuelle au sein d'un système international efficace.

YQ RECOMMANDATION Nº 306

Relative à l'établissement d'une veille sur la fréquence 156,8 MHz par les stations côtières aux fins de détresse (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la fréquence 156,8 MHz a été désignée comme fréquence internationale de détresse pour les stations du service mobile maritime fonctionnant dans les bandes autorisées entre 156 MHz et 174 MHz;

b) Que cette fréquence est très utile pour les communications à courte distance et que son utilisation, dans des situations de détresse, contribuera à améliorer notablement la sécurité de la vie humaine en mer, en particulier dans les zones à trafic élevé où l'on peut maintenir une écoute efficace;

c) Que bien des administrations desservent d'ores et déjà leurs côtes dans la bande 156-174 MHz;

d) Qu'il serait cependant peu pratique on inutile pour certaines administrations, dans les conditions qui leur sont propres, d'assurer une desserte suffisante de leurs côtes dans la bande 156-174 MHz, permettant une veille efficace aux fins de détresse sur la fréquence 156,8 MHz;

recommande

que les administrations, lorsqu'elles le jugent nécessaire et possible dans la pratique, prennent les mesures nécessaires à la mise en œuvre d'une veille sur la fréquence 156,8 MHz aux fins de détresse sur les côtes de leur pays.

YL RECOMMANDATION Nº 307

Relative aux choix, dans les bandes du service mobile maritime comprises entre 1605 Hz et 3800 Hz, d'une fréquence réservée aux besoins de la sécurité (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la radiotéléphonie à ondes hectométriques présent une utilité croissante pour la sécurité des navires puisque:

i) Conformément aux dispositions de la Convention internationale pour la sauvergarde de la vie humaine en mer (Londres, 1960), les navires de charge d'une jauge brute comprise entre 300 et 1600 tonneaux, à moins d'être pourvus d'une station radiotélégraphique, doivent être pourvus d'une station radiotéléphonique;

ii) L'Organisation intergouvernementale consultive de la navigation maritime (OMCI) recommande (3) que les navires obligatoirement équipés, soit, d'une installation radiotélégraphique (navires de plus de 1600 tonneaux de jauge brute), soit d'une installation radiotéléphonique, soient en outre dotés d'installations leur permettant une écoute permanente, lorsqu'ils sont en mer, sur la fréquence radiotéléphonique de détresse; que l'on encourage, sur les navires équipés pour la radiotélégraphie, l'installation d'un émetteur radiotéléphonique pouvant fonctionner dans la bande des 2 MHz; et que les administrations envisagent d'adopter une réglementation nationale imposant l'installation d'une récepteur de veille sur la fréquence de détresse radiotéléphonique à bord des navires auxquels la Convention de Londres (1960) ne s'applique pas;

---

(1) Remplace la Recommandation Nº Mar2-10 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).
(2) Remplace la Recommandation Nº Mar2-2 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).
(3) Résolution A.217 (VII) de l'OMCI.

b) Que néanmoins, dans bien des régions, la veille sur la fréquence radiotéléphonique de détresse en ondes hectométriques est très difficile à cause des nombreux appels transmis sur cette fréquence pour le trafic courant;

c) Que des difficultés analogues se présenteraient même si des systèmes de veille et d'alarme plus évolués que les systèmes actuels étaient adoptés;

d) Que, dans certaines régions, le trafic radiotéléphonique sur ondes hectométriques s'accroît constamment;

invite le CCIR

à entreprende d'urgence une étude des aspects techniques et d'exploitation des problèmes que soulève la situation exposée ci-dessus;

recommande

que la prochaine conférence administrative mondiale des radiocommunications compétente détermine, en fonction des résultats des travaux du CCIR:

1. Une fréquence réservée à la transmission des appels et messages de détresse et, éventuellement, des signaux et messages d'urgence ainsi que des signaux et certains messages de sécurité, à l'exclusion de tout appel destiné au trafic courant;

2. Une fréquence, différente de la précédente, destinée à l'appel à la voix et à l'appel sélectif pour le trafic courant;

3. Pour chacune de ces deux fréquences, une bande de garde de largeur convenable.

YO

RECOMMANDATION Nº 308

Relative à la désignation de fréquences des bandes d'ondes hectométriques à utiliser en commun par les stations côtières radiotéléphoniques pour les communications avec les stations de navire de nationalités autres que la leur (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

notant

a) Que sur les navires de faible tonnage dotés d'appareils à bande latérale unique, il est essentiel de disposer d'un récepteur à fréquences fixes pilotées par quartz afin que le réglage correct soit facilité;

b) Que les navires de ce type qui effectuent des voyages internationaux et communiquent avec des stations côtières de nationalités autre que la leur, ont besoin de disposer d'un nombre considérable de quartz supplémentaires;

c) Que réduire le nombre des quartz nécessaires permet de maintenir à un niveau satisfaisant le coût des récepteurs à bande latérale unique;

considérant

a) Qu'il convient d'assigner à toutes les stations côtières des fréquences de travail internationales pour leurs communications avec des navires de nationalités autres que la leur, une telle utilisation de ces fréquences n'excluant par leur emploi pour les besoins nationaux;

b) Qu'en examinant le Fichier de référence international des fréquences, il est apparu que, pas plus à l'échelon régional qu'à échelon mondial, il ne semblait exister de fréquence disponible susceptible d'être utilisée par les stations côtières pour leurs communications avec des navires de nationalités autres que la leur;

recommande

1. Que les administrations étudient cette question au plus tôt afin de formuler des propositions destinées à être présentées à la prochaine conférence administrative des radiocommunications habilitée à traiter de cette question;

2. Que, entre-temps, le pays recherchent la possibilité de conclure des arrangements régionaux, bilatéraux ou multilatéraux, afin de mettre à la disposition des stations côtières des fréquences de travail communes pour communiquer avec des stations de navire de nationalités autres que la leur.

---

(1) Remplace la Recommandation Nº Mar5 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

YB RECOMMANDATION Nº 309

Relative à la désignation d'une fréquence dans les bandes 435-495 kHz ou 505-526,5 kHz (525 kHz dans la Région 2) sur une base mondiale pour l'émission par les stations côtières des bulletins météorologiques et des avis aux navigateurs, à l'intention des navires, au moyen de la télégraphie à impression directe à bande étroite.

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que pour améliorer les dispositions existantes du système actuel d'urgence et de sécurité maritimes, l'Organisation intergouvernementale consultive de la navigation maritime (OMCI) a recommandé (1) aux administrations d'introduire des émissions de télégraphie à impressim directe à bande étroite pour diffuser les bulletins météorologiques et les avis aux navigateurs;
b) Que ces émissions auraient pour effet de renforcer la sécurité de la vie humaine en mer;
c) Que le CCIR a recommandé (2) un système automatique de télégraphie à impression directe pour la transmision aux navires d'informations concernant la navigation et la météorologie;
d) Que, dans certains pays d'Europe, des administrations assurent déjà de telles émissions à titre expérimental en utilisant la fréquence 518 Hz;
e) Qu'un certain nombre d'administration ont proposé à la présent Conférence de désigner la fréquence 518 kHz pour être utilisée à cet effet sur une base mondiale;
f) Que la présente Conférence estime que cette question relève de la prochaine conférence administrative mondiale des radiocommunications compétente;
g) Qu'il est encore nécessaire d'assurer la transmission des avis aux navigateurs et de bulletins météorologiques aux navires au moyen de la télégraphie Morse normale;

recommande

que la prochaine conférence administrative mondiale des radiocommunications compétente étudie cette question et prenne les mesures nécessaires en vue de désigner une fréquence internationale appropriée pour transmettre les avis aux navigateurs et les bulletins météorologiques au moyen de la télégraphie à impression directe à bande étroite, tout en conservant les dispositions relatives à la télégraphie Morse normale actuellement utilisée pour transmettre ces avis;

invite les administrations

à étudier cette question en vue de présenter des propositions pertinentes à la prochaine conférence administrative mondiale des radiocommunications compétente;

demande au Secrétaire général

de comuniquer la présente Recommandation à l'Organisation intergouvernementale consultive de la navigation maritime (OMCI) en la priant de poursuivre son étude de cette question et de formuler les recommandations qui s'imposent.

ZY RECOMMANDATION Nº 310

Relative à un système automatique de radiocommunications sur ondes décimétriques pour le service mobile maritime

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

consciente

a) De la croissance continue de la population du globe et des besoins qui en découlent pour ce qui est du transport sûr et efficace de denrées alimentaires et d'autres marchandises essentielles;
b) De la nécessité d'une croissance économique rapide et efficace dans le monde entier;
c) De ce que les flottes maritimes participent activement au commerce et sont en pleine expansion;

considérant

a) Que la bande d'ondes métriques attribuée au service mobile maritime (appendice 18) est désormais encombrée dans bien des régions du monde;
b) Que les besoins en matière de voies radiotéléphoniques supplémentaires en ondes décimétriques pour les opérations portuaires, le mouvement des navires ainsi que la correspondance publique dans le service mobile maritime sont, pour l'avenir, de l'ordre de 200 à 240 voies duplex dans certaines régions encombrées;

---

(1) Voir la Résolution A-420 (XI) de l'Assemblée de l'OMCI.
(2) Voir l'Avis 540 du CCIR.

c) Qu'il est hautement souhaitable que le système maritime fonctionnant en ondes décimétriques et d'autres systèmes internationaux de correspondance publique du service mobile soient intégralement automatisés, afin d'assurer l'utilisation efficace des voies et d'exploitation économique des services, dans l'intérêt de leurs usagers;

d) Que la normalisation est d'une grande importance dans les services mobiles internationaux;

e) Que les administrations peuvent souhaiter utiliser toutes les voies ou une partie des voies, désignées pour l'utilisation maritime, pour d'autres services mobiles automatisés. Ce peut être le cas lorsqu'il faut assurer des radiocommunications communes ou combinées dans les ports, les voies navigables et sur les jetées adjacentes. Dans les zones où besoins des services mobiles sont nuls, ces voies pourraient être utilisées pour d'autres services de radiocommunication;

ayant pris note

a) Du rapport 587-1 que le CCIR a établi à ce sujet en réponse à la Question 23-2/8;

b) De la Décision 30 par laquelle le CCIR a chargé le Groupe de travail intérimaire 8/5 de poursuivre l'étude de ce sujet sur la base de la Question 23-2/8 et en tenant compte des résultats des études décrites dans le Rapport 587-1;

c) De la Circulaire COM 73 de l'Organization intergouvernementale consultive de la navigation maritime (OMCI) d'après laquelle, en matière de télécommunications à coute distance, les services maritimes internationaux automatiques ont besoin d'une bande de 10 MHz de largeur;

recommande

à la prochaine conférence administrative mondiale des radiocommunications compétente:

1. De désigner des bandes appropriées de largeur suffisante pour un système de communication du service mobile maritime, y compris la correspondance publique, en les prenant dans les bandes actuellement atribuées au service mobile sur le plan mondial;

2. De définir les moyens permettant d'établir, selon les besoins, des plans d'assignation régionaux qui tiennent compte des besoins mondiaux du service mobile maritime et soient compatibles avec l'exploitation d'autres services;

invite le CCIR

1. À étudier d'urgence les bandes auxquelles il y a lieu de donner le préférence pour des raisons d'exploitation et de partage, et de publier un Avis ou un Rapport avant la prochaine conférence administrative mondiale des radiocommunications compétente;

2. À étudier, de concert avec le CCITT, les aspects techniques et d'exploitation d'un système maritime et mobile terrestre intégré et automatisé;

prie le Secrétaire général

de porter le présente Recommandation à la connaissance de l'Organization intergouvernementale consultive de la navigation maritime (OMCI) pour examen et commentaires.

XL RECOMMANDATION Nº 311

Relative à l'utilisation d'un signal à fréquence acoustique consécutif au signal d'alarme radiotéléphonique émis par les stations côtières (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les stations côtières reçoivent de nombreux signaux d'alarme radiotéléphoniques qu'elles ne peuvent identifier, soit parce qu'ils ne sont pas suivis d'un message parlé, soit parce que ce message est inintelligible du fait du niveau trop faible de la modulation, ou d'un brouillage;

b) Que les stations côtières sont tenues de prendre des mesures afin d'identifier tous les signaux d'alarme qu'elles reçoivent et d'alerter les services de recherches et de sauvetage pour la suite à donner;

c) Que bien des signaux d'alarme radiotéléphoniques qui précèdent le message MAYDAY RELAY proviennent de stations côtières situées à des distances considerábles de la station côtière qui les reçoit;

d) Qu'il pourrait être fort utile que l'on pût distinguer les signaux d'alarme radiotéléphoniques émis par les stations côtières de ceux qui sont émis par les stations de navire;

---

(1) Remplace la Recommandation Nº Mar2-5 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

reconnaissant

a) Qu'aucune caractéristique nécessaire pour établir une distinction entre les signaux d'alarme radiotéléphoniques émis par les stations côtières de ceux qui sont émis par les stations de navire ne devrait affecter la réception normale du signal d'alarme radiotéléphonique;

b) Que la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974) a été saisie de propositions tendant à faire suivre par une fréquence acoustique unique le signal d'alarme radiotéléphonique émis par les stations côtières et que des essais pratiques, efectués dans la région de la mer du Nord pendant ladite Conférence, ont montré qu'un signal acoustique à 1300 Hz d'une durée de 10 secondes convient à cet effet;

c) Que les dépenses nécessaires pour transformer les appareils en service dans les stations côtières seraient probablement peu élevées;

recommande

de faire suivre le signal d'alarme radiotéléphonique, lorsqu'il est émis par une station côtière, par un signal acoustique à 1300 Hz d'une durée de 1 secondes (voir le numéro **3272**).

YT

RECOMMANDATION Nº 312

Relative aux études de l'interconnexion des systèmes de radiocommunications mobiles maritimes avec les réseaux téléphonique et télégraphique internationaux (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

notant

a) Qu'elle a adopté et inclus dans l'article 62 des dispositions concernant l'utilisations d'un système numérique d'appel sélectif;

b) Que le CCIR a adopté la Question 9-3/8 relative à un système d'appel sélectif approprié aux futures conditions d'exploitation du service mobile maritime;

c) Que les études caractéristiques techniques et d'exploitation d'un système numérique d'appel sélectif effectuées par le CCIR sont déjà avancées;

d) Que le CCIR a adopté la Question 23-2/8 relative aux systèmes radiotéléphoniques automatiques à ondes métriques pour le service mobile maritime;

e) Que le CCITT étudie l'interconnexion des différents services téléphoniques mobiles internationaux — notamment du service mobile maritime et du service mobile maritime par satellite — et du réseau téléphonique international;

f) Que l'étude de nouvelles Questions (7/I, 4/X) relatives á l'interconnexion des services de télécommunications maritimes par satellite et du service télex international a été proposée au CCITT;

considérant

a) Qu'il est souhaitable de pouvoir réaliser une interconnexion des systèmes de radiocommunication du service mobile maritime avex les réseaux téléphonique et télégraphique publics internationaux, qui permette l'acheminement automatique du trafic échangé entre les stations de navire et les réseaux nationaux;

b) Que cette interconnexion améliorerait très sensiblement les radiocommunications maritimes;

invite instamment le CCIR et le CCITT

à entreprendre toutes les études nécessaires concernant la compatibilité des systèmes de radiocommunications mobiles maritimes avec les systèmes téléphoniques et télégraphiques internationaux, notamment les divers critères de qualité de service permettant une interconnexion totale des services mobiles maritimes avec les réseaux téléphonique et télégraphique internationaux;

et invite des administrations

à donner la priorité à ces études dans leur participation aux travaux du CCIR et du CCITT.

---

(1) Remplace la Recommandation Nº Mar2-19 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

YR RECOMMANDATION Nº 313

Relative à des dispositions temporaires concernant les aspects tecnhiques et d'exploitations du service mobile maritime par satellite (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'elle a adopté un minimum de dispositions destinées à préparer de façon méthodique l'introduction du service mobile maritime par satellite;
b) Que les administrations n'ont encore qu'une expérience faible ou nulle en matière d'exploitation du service mobile maritime par satellite;
c) Que l'on ne saurait en conséquence arrêter dès maintenant des dispositions réglementaires couvrant de façon détaillée et complète les aspects techniques et d'exploitation de ce service;
d) Que cependant des dispositions provisoires d'ordre administratif, technique et relatives à l'exploitation pourraient se révéler nécessaires avant la prochaine conférence administrative des radiocommunications compétente;

recommande

que tout en acquérant l'expérience voulue pour servir de base à l'adoption de dispositions réglementaires détailes par la prochaine conférence administrative des radiocommunications compétente, les administrations qui participent au service mobile maritime par satellite conviennente dispositions temporaires, d'ordre administratif, technique et relatives à l'exploitation, qu'elles les notifient au Secrétaire général et qu'elles invitent les autres administrations à s'y conformer, sans engagement pour l'avenir.

ZK RECOMMANDATION Nº 400

Relative au passage du Plan au nouveau Plan d'allotissement de fréquences dans les bandes attribuées en exclusivité au service mobile aéronautique (R) entre 2850 kHz et 22 000 kHz (2)

La Conférence administrative mMondiale des radiocommunications (Génève, 1979),

considérant

a) Que les Actes finals de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) sont entrés en vigueur le 1er septembre 1979;
b) Que le nouveau Plan d'allotissement de fréquences contenu dans l'appendice 27 Aer2 entrera en vigueur le 1er février 1983 à 00.01 heure UTC;
c) Que quelques administrations souhaiteront peut-être mettre en vigueur certaines dispositions du nouveau Plan d'allotissement de fréquences avant cette dernière date, lorsque cela sera possible sans causer de brouillages préjudiciables aux stations fonctionnant conformément aux dispositions de l'actuel Plan d'allotissement de fréquences;
d) Que, à la suite de la Conférence administrative extraordinaire des radiocommunications aéronautiques (Génève, 1966), l'Organisation de l'aviation civile internationale (OACI), en vertu des dispositions du numéro 27/20 de l'appendice 27 et agissant dans l'esprit et dans le cadre de la Résolution Nº Aer6 de cette Conférence, a élaboré un programme de transition pour le service mobile aéronautique (R), afin de passer du Plan d'allotissement de fréquences de l'appendice 26 à celui de l'appendice 27;
e) Que le programme de transition de l'OACI a été ensuite transmis au Comité international d'enregistrement des fréquences pour diffusion aux administrations des Membres de l'UIT;
f) Qu'il sera utile, une fois encore, d'adopter un programme de nature à faciliter le passage du Plan actuel au nouveau Plan d'allotissement de fréquences;

recommande

1. Que l'OACI soit invitée à élaborer un programme de transition, dans le cadre de l'appendice 27 Aer2, pour l'utilisation opérationnelle par les stations aéronautiques, des fréquences figurant dans le Plan d'allotissement de fréquences, sauf pour les zones des lignes aériennes régionales et nationales (ZLARN) qui n'interviennent pas dans l'exploitation internationale;

2. Que l'OACI soit invitée à transmettre au Comité international d'enregistrement des fréquences, pour diffusion aux administrations, le programme de transition pour le nouveau Plan d'allotissement de fréquences;

---

(1) Remplace la Recommandation Nº Mar 2-15 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).
(2) Remplace la Recommandation Nº Aer2-4 de la Conférence administrative mondiale des radiocommunications maritimes (R) (Génève, 1978).

3. Que les administrations mettent en œuvre les dispositions du programme de transition en coordination avec l'OACI et en conformité avec des principes énoncés au numéro 27/20 de l'appendice 27 Aer2;

prie le Secrétaire général

de porter la présente Recommandation à l'attention de l'Organisation de l'aviation civile internationale.

YN RECOMMANDATION Nº 401

Relative à l'emploi efficace des fréquences du service mobile aéronautique (R) désignées pour utilisation mondiale (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

que la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978), a alloti un nombre limité de fréquences pour utilisation mondiale, aux fins de contrôle de la régularité des vols et de la sécurité des aéronefs;

recommande aux administrations

1. Que le nombre total des stations aéronautiques à ondes décamétriques fonctionnant sur les voies désignées pour utilisation mondiale soit maintenu à un minimum compatible avec une utilisation économique et efficace des fréquences;
2. Que, lorsque cela est possible et pratique, une seule de ce type desserve les exploitants d'aéronafs de pays limitrophes et que, normalement, il n'y ait pas plus d'une station par pays.

ZJ RECOMMANDATION Nº 402

Relative à la coopération en vue de l'emploi efficace des fréquences du service mobile aéronautique (R) désignes pour utilisation mondiale (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'il est nécessaire d'utiliser el plus efficacement possible les fréquences du service mobile aéronautique (R) désignées pour utilisation mondiale;
b) Qu'un Plan a été adopté en vue de l'allotissement par zones des fréquences du service mobile aéronautique (R) désignées pour utilisation mondiale;
c) Qu'une coordination est souhaitable entre les administrations des pays situés dans les zones définies par les Plan d'allotissement;
d) Que l'administration d'un pays a le droit de choisir et de notifier à l'IFRB, en vue de son inscription dans le Fichier de référence international des fréquences, toute assignation de fréquence dans une voie allotie à la zone dans laquelle ce pays est situé;
e) Le rôle que joue l'IFRB dans les procédures de réglementation, conformément à l'article 12 du Règlement des radiocommunications;
f) Le rôle que joue l'Organisation de l'aviation civile internationale (OACI) dans le domaine de l'exploitation aéronautique internationale;

invite

1. Les administrations des pays situés dans une zone mondiale d'allotissement, lorsqu'elles le jugent opportun, et l'OACI à demander l'avis de l'IFRB en vue de procéder, du point de vue tecnhique, au meilleur choix de fréquences, afin d'utiliser avec une efficacité maximale les fréquences du service du service aéronautique (R) désignées pour utilisation mondiale;
2. Les administrations des pays situés dans une zone mondiale d'allotissement, lorsqu'elles le jugent opportun, à coordonner mutuellement l'utilisation de ces fréquences du point de vue de l'exploitation aéronautique et, à cet égard, à ne pas perdre de vue l'avantage qu'elles pourraient avoir à recuellier l'avis de l'OACI dans ce processus;

---

(1) Remplace la Recommandation Nº Aer2-2 de la Conférence administrative mondiale des radiocommunications maritimes (R)(Génève, 1978).
(1) Remplace la Recommandation Nº Aer2-3 de la Conférence administrative mondiale des radiocommunications maritimes (R) (Génève, 1978).

3. L'IFRB à aider toute administration ou groupe d'administrations des pays situés dans une zone mondiale d'allotissement et qui souhaitent coordonner leurs besoins en fréquences désignées pour utilisation mondiale, et à poursuivre sa coopération avec l'OACI à cette fin;

prie le Secrétaire général

de porter la présente Recommandation à l'attention de l'Organisation de l'aviation civile internationale.

V RECOMMANDATION Nº 403

Relative à la mise au point de tecnhiques qui contribueront à réduire l'encombrement des bandes d'ondes décamétriques atrribuées au service mobile aéronautique (R) (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que plusieurs administrations travaillent activement à mettre au point des techniques de télécommunication dont l'utilisation, si elle était plus répandue dans le service mobile aéronautique (R), contribuerait à réduire l'encombrement des bandes d'ondes décamétriques attribuées à ce service; parmi ces techniques, il y a lieu de signaler l'utilisation de fréquences supérieures à celles correspondant aux bandes d'ondes décamétriques avec des stations télécommandées, des antennes à effet directif, des techniques de radiocommunication spatiale et de transmission automatique de données;

b) Qu'il serait utile aux autres administrations de prendre connaisance de ces techniques afin d'en étudier l'application à leurs liaisons du service mobile aéronautique (R);

c) Que l'Organisation de l'aviation civile internationale (OACI) travaille activement à coordonner l'utilisation pratique de ces techniques;

recommande

aux administrations qui travaillent à la mise au point de techinques contribuant à reduire l'encombrement des bandes d'ondes décamétriques d'informer périodiquement l'IFRB des progrés accomplis;

charge l'IFRB

de diffuser périodiquement les renseignements qu'il aura ainsi reçus aux administrations ainsi qu'à l'OACI.

ZX RECOMMANDATION Nº 404

Relative à l'utilisation de la bande 136-137 MHz par le service mobile aéronautique (R) (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que le Tableau d'attribution des bandes de fréquences modifié par la présente Conférence, comporte des attributions au service mobile aéronautique (R) à titre primaire, et aux services fixe et mobile, sauf mobile aéronautique (R) à titre secondaire dans la bande 136-137 MHz;

b) Qu'il est prévu également des attributions au service d'exploitation spatiale (espace vers Terre), au service de météorologie par satellite (espace vers Terre) et au service de recherche spatiale (espace vers Terre) à titre primaire jusqu'au 1er janvier 1990, et ensuite à titre secondaire, et que le service mobile aéronautique (R) ne peut être indroduit à titre primaire qu'après le 1er janvier 1990, conformément aux plans approuvés à l'échelle internationale pour ce service;

c) Que le service mobile aéronautique (R) risque, à partir de cette date, d'être soumis à des brouillages dangereux pour la sécurité de la navigation aérienne et qu'il importe au plus haut point de protéger ce service contre les brouillages causés par des stations des services suivants: fixe, mobile, sauf mobile aéronautique (R), de recherche spatiale (espace vers Terre), d'exploitation spatiale (espace vers Terre) et de météorologie par satellite (espace vers Terre);

---

(1) Remplace la Recommandation Nº Aer2-1 de la Conférence administrative mondiale des radiocommunications maritimes (R) (Génève, 1978).
(2) Remplace la Recommandation Nº Spa7 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1963).

recommande

1. Que, dans toutes les Régions, les administrations utilisant ou ayant l'intention d'utiliser, après le 1er janvier 1990, des stations des services fixe, mobile, sauf mobile aéronautique (R), d'exploitation spatiale (espace vers Terre), de météorologie par satellite (espace vers Terre) et de recherche spatiale (espace vers Terre) dans la bande 136-137 MHz prennent toutes les dispositions possibles pour assurer la protection nécessaire au service mobile aéronautique (R) et pour faire cesser le fonctionnement des stations des autres services auxquels la bande est attribuée à tire secondaire, au fur et à mesure de la mise en service des stations du service mobile aéronautique (R);

2. Que les administrations notifient au Comité international d'enregistrement des fréquences (IFRB), leurs plans de mise en service mobile aéronautique (R);

3. Que les administrations notifient à l'IFRB, de préférence à l'avance, la date à laquelle les stations autorisées à fonctionner à titre secondaire cesseront de fonctionner, en se référant à la présente Recommandation:

et prie l'IFRB

de publier ces renseignements touts les six mois à partir du 1er janvier 1985.

Y RECOMMANDATION N° 405

Relative à une étude de l'utilisation du service mobile aéronautique (R) par satellite (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Les efforts suivis déployés dans le service mobile aéronautique (R) en vue d'améliorer les communications en proportion de l'accroissement du nombre, des dimensions et de la vitesse des aéronefs;
b) Les efforts déployés par l'Union internationale des télécommunications pour réduire l'encombrement des bandes de fréquences comprises entre 4 MHz et 27,5 MHz;
c) La nécessité d'utiliser avec économie les ondes décamétriques;

notant

a) Que l'application des techniques des radiocommunications spatiales aux besoins de l'aviation civile internationale offre la possibilité d'améliorer substantiellement les communications du service mobile aéronautique (R) tout en évitant l'encombrement des bandes comprises entre 4 MHz et 27,5 MHz;
b) Que des essais on prouvé qu'il est possible d'établir des communications entre les aéronefs et des stations aéronautiques en utilisent comme relais un satellite géostationnaire;
c) Que la technologie des radiocommunications spatiales progresse rapidement;
d) Que les possibilités techniques laissent supposer que, dans un proche avenir, on pourra disposer de moyens de radiocommunications spatiales qui devraient permettre de satisfaire bon nombre des besoins du service mobile aéronautique (R) sur les lignes aériennes mondiales principales, sauf toutefois sur les lignes polaires;
e) Qu'avant que les administrations soient disposés à mettre en œuvre un programme visant à l'application des techniques des radiocommunications spatiales, il convient de procéder à une étude approfondie de ces techniques et de définir les mesures à prendre;
f) Que la mesure dans laquelle les administrations peuvent mettre en œuvre un tel programme est étroitement liée aux conséquences économiques de son application;
g) Que l'Organisation de l'aviation civile internationale (OACI) est l'institution internationale intéressée au premier chef par l'établissement de normes et pratiques recommandées régissant les systèmes et techniques de radiocommunication utilisés au profit de l'aviation civile internationale;
h) Que le CCIR a étudié l'application des techniques de radiocommunication spatiale dans le service mobile aéronautique (R), mais que ces études pourraient nécessiter une révision;

invite le CCIR

à poursuivre ses études sur l'application des techniques de radiocommunication spatiale dans le service mobile aéronautique (R) en coopération avec l'OACI:

recommande

1. Que les administrations, tenant compte des facteurs économiques et d'exploitation en jeu, prennent en considération les possibilités de donner satisfaction aux besoins du service mobile aéronautique (R) sur les lignes aériennes mondiales principales en recourant aux techniques des radiocommunications spatiales;

2. Que les administrations poursuivent l'étude de ces questions en se fondant sur les facteurs exposés dans l'annexe à la présente Recommandation.

---

(1) Remplace la Recommandation N° Aer2 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1966).

ANNEXE A LA RECOMMANDATION Nº 405 (1)

1. Caractéristiques techniques du système de réception et d'émission des satellites et des aéronefs:

a) Puissance (porteuse) requise à la réception dans le sens aéronef-satellite;
b) Puissance (porteuse) requise à la réception dans le sens satellite-aéronef;
c) Puissance apparente rayonnée par la station de satellite (par voie);
d) Puissance apparente rayonnée par la station terrienne d'aéronef (par voie);
e) Type de transmission à utiliser;
f) Largeur de bande de chaque voie;
g) Disposition des voies;
h) Conditions de polarisation;
i) Nécessité d'utiliser à bord de l'aéronef une antenne sans effet directif; réflexions sur la mer (ou sur le sol);
j) Écart requis entre les fréquences d'émission et de réception du satellite;
k) Caractéristiques du satellite permettant aux aéronefs d'utiliser indépendamment chaque voie (accés multiple ou aléatoire);
l) Conditions concernant la fiabilité du système;
m) Divers.

2. Nombre et emplacement des satellites:

a) Service à assurer; répartition géographique des lignes aériennes et nombre de vols sur chacune d'elles;
b) Groupe de lignes aériennes susceptibles d'être desservies à l'aide d'un satellite commun;
c) Nombre de satellites nécessaires pour desservir chaque groupe de lignes aériennes;
d) Emplacement de chacun des satellites;
e) Nombre de voies dont chaque satellite doir disposer;
f) Divers.

3. Caractéristiques techniques requises pour les stations terriennes aéronautiques:

a) Caractéristiques convenables des antennes d'émission et de réception; gain, largeur du faisceau, emplacement, etc;
b) Puissance apparente rayonnée minimale;
c) Mise au point et utilisation de stations terriennes terminales à prix modique;
d) Nécessité d'un système d'appel sélectif (SELCAL);
e) Divers.

4. Mode de fonctionnement et emplacement des stations terriennes aéronautiques:

a) Mode de fonctionnement; lorsque la station de satellite dispose de multiples fréquences, est il nécessaire ou non de continuer à appliquer la méthode actuelle consistant á assurer la séparation des lignes aériennes en utilisant des fréquences distinctes, c'est-à-dire:

De mettre à la disposition de toutes les stations terriennes toutes les fréquences du service (R) utilisées par le satellite; ou
De répartir la charge du trafic entre les fréquences disponibles, l'utilisation de chacune d'elles étant limitée à une région géographique déterminée; ou encore
De prévoir quelque autre arrangement;

b) Le cas échéant, établissement d'une liste (par ordre de fréquences) mentionnant les station terriennes qui doivent utiliser une fréquence déterminée du satellite;
c) Divers.

5. Dispositions permettant l'acheminement du trafic aéronautique entre points fixes:

a) Caractéristiques techniques relatives aux installations terminales;
b) Caractéristiques techniques relatives au matériel installé à bord du satellite;
c) Caractéristiques du satellite permettant aux installations terminales d'avoir indépendamment accès aux relais établis au moyen de ce satellite (accès multiple ou aléatoire);
d) Bandes de fréquences à utiliser;
e) Écart requis entre les fréquences d'émission et de réception du satellite;
f) Mise au point et utilisation d'installations terminales à prix modique;

---

(1) La liste de facteurs ci-dessus n'a pas la prétention d'être exhaustive. Elle n'a pas non plus pour objet de restreindre l'examen de tout autre aspect de l'utilisation du service mobile aéronautique (R) par satellite.

g) Organismes qui devraient fournir, posséder ou exploiter des satellites et des installations terminales; mesure dans laquelle il convient d'acheminer les communications entre points fixes du service aéronautique;
h) Divers.

6. Estimation du coût d'un système à satellites comprenant le matériel à terre, le matériel à bord des aéronefs et le matériel à bord du ou des satellites.

7. Questions d'exploitation concernant un système à satellites, y compris le matériel énuméré au paragraphe 6 ci-dessus, en particulier:

a) Le cadre général dans lequel le système a à fonctionner;
b) Le processus évolutif de mise en œuvre du système.

YF RECOMMANDATION N.° 406

Relative à la révision du Plan d'allotissement des fréquences pour le service mobile aéronautique (OR) (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les Plans d'allotissement des fréquences pour le service mobile aéronautique établis par la Conférence Internationale administrative des radiocommunications aéronautiques (CIARA) (Génève, 1949), et adoptés par la Conférence administrative extraordinaire des radiocommunications (Génève, 1951), ont été adoptés dans une grande mesure par la Conférence administrative des radiocommunications (Génève, 1959) et inclus dans le Règlement des radiocommunications;
b) Que la Conférence administrative extraordinaire des radiocommunications chargée de la révision du Plan d'allotissement pour le service mobile aéronautique (R) (Génève, 1966) a décidé d'inclure ce Plan comme appendice 27;
c) Que la Conférence Administrative Mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978) a adopté des principes techniques pour l'établissement du Plan d'allotissement de fréquences pour le service mobile aéronautique (R) dont notamment l'eploi de l'espacement entre fréquences porteuses de 3 kHz pour une utilisation de classes d'émission et de puissance déterminées qui peuvent être repris directement pour l'établissement du Plan d'allotissement du service mobile aéronautique (OR);
d) Que depuis la Conférence administrative des radiocommunications (Génève, 1959), il n'y a eu aucune révision du Plan d'allotissement du service mobile aéronautique (OR);
e) Que depuis 1959 de nombreux pays sont devenus Membres de l'Union;
f) Que la présente Conférence a adopté la Résolution **403** relative à utilisation des fréquences 3023 kHz et 5680 kHz communes aux services mobiles aéronautiques (R) et (OR);
g) Que la Convention internationale des télécommunications (Malaga-Torremolinos, 1973) prévoit au numéro 44 de l'article 7 qu'une conférence administrative mondiale des radiocommunications peut procéder à la révision partielle du Règlement des radiocommunications.

émet l'avis

que le Plan du service mobile aéronautique (OR), tel qu'il figure à l'appendice 26 du Règlement des radiocommunications, doit faire l'objet d'un nouvel examen et qu'il importe que les administrations procédent d'urgence à l'étude des besoins en communications de leurs liaisons aéronautiques tant nationales qu'internationales, afin de déterminer à quel moment il faudra entreprendre ce nouvel examen dans les conditions les plus favorables aux intérêts aéronautiques;

recommande

que le Conseil d'administration convoque une conférence administrative mondiale des radiocommunications chargée de procéder à un nouvel examen de l'appendice 26 et des dispositions connexes du Règlement des radiocommunications.

XB RECOMMANDATION N° 407

Relative au numéro 27, 123 de l'appendice 27 Aer2 (subdivision de Zone 5B) (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

---

(1) Remplace la Résolution N° 13 de la Conférence administrative des radiocommunications (Génève, 1959) et la Recommandation N.° Aer-8 de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978).

(2) Remplace la Recommandation N° Aer-7 de la Conférence administrative mondiale des radiocommunications du service mobile aéronautique (R) (Génève, 1978).

considérant

a) Les discussions qui ont eu lieu au sujet de la proposition de modification du numéro 27/123 de l'appendice 27 Aer2;

b) Le fait que les administrations intéressés sont convenues de poursuivre entre elles les consultations relatives à la subdivision de Zone 5B;

recommande

1. Que les administrations intéressées procédent à ces consultations afin de parvenir à une solution satisfaisante;

2. Que les administrations concernées présentent les résultats de leurs consultations à la prochaine conférence administrative mondiale des radiocommunications compétente, afin que celle-ci aboutisse à une conclusion définitive concernant le numéro 27/123.

H RECOMMANDATION N.º 500

Relative à l'élaboration de la documentation technique nécessaire pour la Conférence administrative mondiale des radiocommunications pour la radiodiffusion à ondes décamétriques

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

que, si les taxes du CCIR fournissent déjà un volume important de documentation technique sur la radiodiffusion à ondes décamétriques, certains sujets nécessitent néanmoins des études complémentaires et que, dans certains cas, la documentation disponible doit être adaptée en vue de son utilisation aux fins de planification;

notant en particulier

a) Que le CCIR a recommandé une méthode d'évaluation du champ et de l'affaiblissement de transmission dans la bande 7 (ondes décamétriques) fondée sur les renseignements disponibles les plus fiables, et qu'il a entrepris d'élaborer une nouvelle méthode informatique qui englobe les éléments spéciaux jugés nécessaires pour améliorer la précision de ces évaluations pour les longues et moyennes distances, ainsi que dans les régions équatoriales et les régions à latitude élevée;

b) Que l'on possède peu de renseignements sur les prévisions de propagation dans le nombreuses régions équatoriales;

c) Que l'emploi d'antennes directives et indispensables pour une utilisation efficace du sprectre dans la bande 7 (ondes décamétriques) et que les rayonnements dans des directions autres que la direction désirée peuvent causer des brouillages;

prie le CCIR

1. D'achever ses travaux relatifs à l'établissement d'une méthode améliorée de prévisions par ordinateur (Avis 533), en tenant compte particulièrement des trajets transéquatoriaux de moyenne et grande longueur, et des régions situées à des latitudes élévées;

2. D'adapter la méthode appliquée actuellement pour les prévisions de propagation de façon qu'elle soit mieux adaptée à la planification du service de radiodiffusion et de recommander les valeurs des indices d'activité solaire;

3. D'émettre, lorsqu'il n'en existe pas encore, des Avis relatifs aux rapports de protection, y compris dans les cas où le signal non désiré et d'un type différent, aux valeurs appropriées d'espacement des canaux et à la valeur minimale du rapport signal/bruit pour une réception satisfaisante;

4. De faire en sorte que le recueil des diagrammes d'antennes du CCIR tienne compte de tous les principaux types d'antennes d'usage courant;

5. De préparer des données sur les performances pratiques des antennes directives et de les présenter sous une forme qui convienne à la planification;

invite les administrations

à participer activement à ces études et à fournir au CCIR les renseignements dont elles disposent sur les questions énumérées ci-dessus et particulièrement sur les valeurs de champ observées dans la bande 7 (ondes décamétriques) en vue d'une comparaison avec les valeurs prévues.

I RECOMMANDATION Nº 501

Relative à l'étude de l'introduction de la technique de la bande latérale unique dans les bandes d'ondes décamétriques attribuées au service de radiodiffusion, pour la préparation de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion à ondes décamétriques.

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que l'emploi de la bande latérale unique permet une utilisation plus efficace du spectre;
b) Que l'introduction de cette technique aux fins de la radiodiffusion à ondes décamétriques pose des problèmes d'ordre technique et économique;

prie le CCIR

de hâter les études concernant l'introduction de la technique de la bande latérale unique dans le service de radiodiffusion à ondes décamétriques et les spécifications d'un système à bande latérale unique approprié, en prêtant une attention particulière aux problèmes économiques concernant les émetteurs et les récepteurs;

invite les administrations

à fournir au CCIR des renseignements sur ce sujet.

ZP RECOMMANDATION N° 502

Relative aux spécifications des récepteurs de télévision à prix modique

La Conférence Administrative Mondiale des Radiocommunications (Génève, 1979),

considérant

a) Que l'on prend de plus en plus conscience des possibilités offertes par la télévision en tant qu'instrument de développement national;
b) Qu'il a été démontré que la réception directe d'émissions de télévision à partir de satellites est réalisable sur le plan technique et intéressante du point de vue économique;
c) Que, dans le limite des ressources restreintes dont ils disposent, de nombreaux pays en développement pourraient souhaiter exploiter au maximum les avantages de la télévision;
d) Que l'existence d'un récepteur de télévision efficace et à prix modique constituerait un stimulant puissant à la mise en place et au développement de services de radiodiffusion télévisuelle dans les pays en développement;
e) Que l'on peut prévoir qu'on aura besoin de récepteurs de télévision monochrome et en couleur pour recevoir les émissions en provenance de stations de Terre et de satellites;
f) Que le CCIR a déjà entrepris l'étude de spécifications pour des récepteurs à de télévision monochrome à prix modique, à usage domestique et à usage communautaire, de même que celle des caractéristiques d'un système de réception pour le service de radiodiffusion (télévision) par satellite;
g) Qu'un accord général sur la qualité de fonctionnement de récepteurs de télévision appropriés aiderait considérablement les constructeurs de ces récepteurs à produire des appareils du type voulu, répondant à des normes de qualité adéquates, et cela pour un prix de revient aussi bas que possible;
h) Qu'il faut tenir compte, dans la conception et la production des récepteurs de télévision, des progrés rapides de la technique ainsi que de l'obsolescence;

invite le CCIR

1. À établir des spécifications de qualité de fonctionnement pour un ou plusieurs types de récepteurs de télévision à prix modique, conformément au point *e*) ci-dessus, et convenant à la production en série;
2. À collaborer, si besoin est, avec d'autres organismes internationaux qui travaillent dans le même domaine afin de mettre au point dans les plus brefs délais des spécifications pour ces récepteurs à prix modique;

prie le Secrétaire général

de communiquer au Secrétaire général des Nations Unies, notamment à l'intention du directeur de l'organisation des Nations Unies pour de Développement Industriel, les résultats de ces travaux, accompagnés de suggestions en ce qui concerne les mesures à prendre et au directeur général de l'UNESCO pour information.

ZS RECOMMANDATION N° 503

Relative à la radiodiffusion en ondes décamétriques

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) L'encombrement des bandes d'ondes décamétriques attribuées au service de radiodiffusion;
b) L'importance des brouillages dans la voie adjacente;

notant

qu'il est possible d'améliorer cette situation en appliquant les Avis pertinents du CCIR;

recommande aux administrations

1. D'accorder une attention particulière aux dispositions relatives au «sprectre hors bande» contenues dans l'avis 328-4 du CCIR;

2. D'encourager, dans toute le mesure du possible, les constructeurs à mettre au point et à construire des récepteurs de radiodiffusion conformes aux dispositions de l'avis 332-4 du CCIR relatif à la sélectivité des récepteurs;

invite les administrations

à tirer parti, dans toute la mesure pratiquement possible, du fonctionnement synchronisé des émetteurs en tenant compte de l'avis 205-1 du CCIR;

invite le CCIR

à effectuer d'autres études relatives aux Avis mentionnés ci-dessus, en tenant compte des besoins de la radiodiffusion en ondes décamétriques, en vue de mettre à jour ces trois avis chaque fois que cela est nécessaire.

YC RECOMMANDATION Nº 504

Relative à la préparation d'un plan de radiodiffusion dans la bande 1605-1705 kHz dans la Région 2

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que la bande 1605-1705 kHz a été attribuée par la présente Conférence au service de radiodiffusion dans la Région 2;

b) Que, conformément au numéro **480**, l'utilisation de cette bande par le service de radiodiffusion est subordonnée à l'élaboration d'un plan de radiodiffusion par une conférence administrative régionale des radiocommunications;

c) Que le Tableau d'attribution des bandes de fréquences prévoit en outre que, dans la Région 2, la bande 1605-1625 kHz est attrivuée en exclusivité au service de radiodiffusion et que la bande 1625-1705 kHz est attribuée au service de radiodiffusion en partage avec d'autres services;

tenant compte

des dispositions du numéro **346** du Règlement des radiocommunications;

recommande

1. Qu'une conférence administrative régionale des radiocommunications soit convoquée en vue d'établir un plan pour le service de radiodiffusion dans la bande 1605-1705 kHz dans la Région 2;

2. Que cette conférence soit convoquée en 1985 au plus tard;

3. Que la date exacte d'entrée en vigueur du plan soit fixée lors de ladite conférence administrative régionale des radiocommunications. Toutefois, l'utilisation de ces bandes par le service de radiodiffusion ne devrait pas commencer avant le 1er juillet 1987 pour les fréquences comprises entre 1625 kHz et 1665 kHz et avant le 1er juillet 1990 pour les fréquences comprises entre 1665 kHz et 1705 kHz;

invite

1. Le Conseil d'administration à prendre les mesures nécessaires pour la convocation d'une conférence administrative des radiocommunications pour la Région 2 chargée de planifier l'utilisation de la bande 1605-1705 kHz par le service de radiodiffusion;

2. Le CCIR à effectuer les études techniques nécessaires pour la convocation d'une conférence de radiodiffusion pour la Région 2, en tenant compte des attributions faites à d'autres services dans les Régions 1 et 3 et de la nécessité d'établir des critères de partage;

encourage les administrations de la Région 2

à favoriser le développement et la production en quantité suffisante de récepteurs convenant pour la bande de radiodiffusion étendue à la fréquence 1705 kHz.

ZL

RECOMMANDATION N° 505

Relative à des études de propagation dans la bande des 12 GHz pour le service de radiodiffusion par satellite (1)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que les critères techniques adoptés lors de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) chargée d'établir un plan d'assignations pour le service de radiodiffusion par satellite dans les Régions 1 et 3, comprenaient une marge maximale de 2 dB, sous un angle de site de 45°, pour l'affaiblissement par les précipitations;

b) Que certaines études ont indiqué que la marge nécessaire dans la Zone tropicale pourrait être supérieure à 2 dB;

c) Que la Réunion spéciale préparatoire du CCIR (Génève, 1978) a reconnu que, pour l'application de la technique proposée dans le Rapport 721 du CCIR, les données disponibles sur les taux de précipitation sont de nature à conduire à une sous-estimation de l'affaiblissement qui se produit dans les régions tropicales;

d) Qu'il est également nécessaire de rassembler une masse de renseignements sur divers autres facteurs de propagation à prendre en compte pour planifier le service de radiodiffusion par satellite;

recommande au CCIR

1. D'accélérer l'étude des effets de l'affaiblissement dû aux précipitations dans les régions tropicales et de spécifier, le plus rapidement possible, les valeurs de l'affaiblissement compatibles avec un fonctionnement satisfaisant du service de radiodiffusion par satellite;

2. De poursuivre l'étude des effets de l'affaiblissement dû aux précipitations sous de petits angles de site, dans toutes les zones hydrométéorologiques;

3. De poursuivre l'étude des effets des tempêtes de sable et de poussière;

4. D'étudier la relation existant entre les caractéristiques de propagation pendant 99 % du mois le plus défavorable et celles de la propagation pendant l'année;

5. D'étudier, pour le émissions à polarisation circulaire, le niveau de la composante dépolarisée par rapport à la composante polarisée;

demande au directeur du CCIR

de porter à la connaissance de toutes les administrations les valeurs de l'affaiblissement dû aux précipitations qui auront été spécifiées.

ZC

RECOMMANDATION N.° 506

Relative aux harmoniques de la fréquence fondamentale des stations de radiodiffusion par satellite (2)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que la bande de fréquences 23,6-24 GHz est attribuée au service de radioastronomie à titre primaire;

b) Que le second harmonique de la fréquence fondamentale des stations de radiodiffusion par satellite fonctionnant dans la bande 11,8-12 GHz pourrait perturber considérablement les observations de radioastronomie dans la bande 23,6-24 GHz si des mesures efficaces n'étaient pas prises pour abaisser le niveau de cet harmonique;

vu

les dispositions du numéro **306** du Règlement des radiocommunications;

recommande

que, lorsqu'elles déterminent les caractéristiques de leurs stations spatiales du service de radiodiffusion par satellite, notamment dans la bande 11,8-12 GHz les administrations prennent toutes les mesures nécessaires pour abaisser le niveau du seconde harmonique au-dessus des valeurs indiquées dans les Avis pertinents du CCIR.

---

(1) Remplace la Recommandation N° Sat-3 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

(2) Remplace la Recommandation N° Sat-2 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

ZF

RECOMMANDATION Nº 507

Relative aux rayonnements non essentiels dans le service de radiodiffusion par satellite (1)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que, du fait du niveau élevé de leur puissance, les stations spatiales du service de radiodiffusion par satellite causeront vraisemblablement, par suite de rayonnements non essentiels, des brouillages aux services assurés dans les bandes de fréquences adjacentes ou en relation harmonique;

b) Que l'on doit tenir compte, lors de la planification du service de radiodiffusion par satellite, de la nécessité de réduire à un niveau acceptable la brouillage causé:

Aux services assurés dans les bandes adjacentes se trouvant à la limite inférieure et à la limite supérieure de la bande 12 GHz attribuée au service de radiodiffusion;

Au service de radioastronomie auquel la bande 23,6-24 GHz est attribuée;

c) Que le CCIR poursuit l'étude de ce problème au titre du Programme d'études pertinent;

invite le CCIR

à poursuivre d'urgence l'étude des questions techniques et d'exploitation que posent les rayonnements non essentiels des stations spatiales du service de radiodiffusion par satellite.

ZD

RECOMMANDATION Nº 508

Relative aux antennes d'émission du service de radiodiffusion par satellite (2)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Qu'il est nécessaire de disposer d'une documentation abondante sur les antennes d'émission pour la planification du service de radiodiffusion par satellite;

b) Que le CCIR poursuit l'étude de ces problèmes au titre des questions et des programmes d'études pertinents;

invite le CCIR

1. À poursuivre l'étude des diagrammes de référence pour les composants copolaire et contrapolaire des antennes d'émission du service de radiodiffusion par satellite, aussi bien pour la réception individuelle que pour la réception communautaire et, en particulier, l'étude des moyens permettant d'obtenir une meilleure suppression des lobes latéraux et des conséquences économiques qui en découlent;

2. À poursuivre l'étude des caractéristiques techniques permettant d'obtenir une précision de pointage de l'antenne d'émission telle que:

L'écart du faisceau d'antenne par rapport à sa direction de pointage nominale ne dépasse pas 0,1°;

L'angle de rotation du faisceau d'émission autour de son axe ne dépasse pas ± 2°;

YZ

RECOMMANDATION Nº 600

Relative à l'utilisation de la bande de fréquences 9300-9500 MHz (3) (4)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

notant

a) Qu'il existe deux classes principales de radiodétecteurs météorologiques d'aéronef fonctionnant respectivement dans les bandes 5350-5460 MHz et 9300-9500 MHz;

---

(1) Remplace la Recommandation Nº Sat-6 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

(2) Remplace la Recommandation Nº Sat-4 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

(3) Voir aussi la Résolution 600.

(4) Remplace la Recommandation Nº 12 de la Conférence administrative des radiocommunications (Génève, 1959).

b) Qu'il existe un nombre considérable de radiodétecteurs de navire dont la mejeure partie fonctionne dans la bande 9300-9500 MHz;
c) Qu'il existe également dans la bande 9300-9500 MHz des radiodétecteurs à terre du service de radionavigation maritime, du service de radionavigation aéronautique et du service météorologique;
d) Que l'utilisation de la bande 5350-5460 MHz attribuée à titre primaire, au seul service de radionavigation aéronautique, est limitée aux dispositifs de radiodétection aéroportés;
e) Que les radiodétecteurs de navire partagent uniquement avec les radiodétecteurs de terre l'utilisation des bandes 2900-3100 MHz et 5470-5650 MHz attribuées à titre primaire respectivement au seul service de radionavigation et au seul service de radionavigation maritime;
f) Qu'il s'est avéré nécessaire d'attribuer la bande 9300-9500 MHz, sur la base de l'égalité des droits, au service de radionavigation aéronautique et au service de radionavigation maritime;
g) Que, dans la bande 9300-9320 MHz, l'utilisation de radiodétecteurs de navire n'est plus autorisée, afin de faciliter le développement des balises de radiodétection à fréquence fixe dans cette bande;
h) Que, dans la bande 9320-9500 MHz, l'utilisation de balises de radiodétection à fréquence fixe du service de radionavigation maritime, sur terre ou en mer, n'est pas autorisée;

considérant

a) Qu'il est de la plus haute importance qu'aucun brouillage préjudiciable ne soit causé aux services de radionavigation qui assurent la sauvegarde de la vie humaine;
b) Qu'il convient que les conditions de fontionnement d'un service de sauvegarde de la vie humaine soient les mêmes dans le monde entier;
c) Que l'accroissement de l'utilisation de la bande 9300-9500 MHz ne peut, en l'absence de coordination, qu'augmenter la probabilité de brouillages préjudiciables entre le service de radionavigation aéronautique et le service de radionavigation maritime;

recommande

1. Que les administrations, l'Organisation de l'aviation civile internationale (OACI) et l'Organisation consultative intergouvernementale de la navigation maritime (OMCI) étudient cette question dès qu'elles le pourront, et notamment;
2. Qu'elles déterminent si, et dans quelles proportions, un brouillage reconnu techniquement possible entre les deux services devient préjudiciable en cours d'exploitation;
3. Qu'elles recherchent, si une telle éventualité se produit, la possibilité de réduire le brouillage préjudiciable par les moyens techniques d'exploitation et de procédure, en admettant que les nouveaux matériels doivent toujours correspondre aux normes techniques les plus élevées;

invite

les administrations, l'Organisation de l'aviation civile internationale et l'Organisation consultive intergouvernementale de la navigation maritime à communiquer à l'Union les résultats de leurs études ainsi que leurs opinions et les propositions qui en découlent.

YK RECOMMANDATION Nº 601

Concernant les fréquences à utiliser dans le service de radionavigation aéronautique pour un système destiné à éviter les collisions entre aéronefs (1)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que l'on n'a pas encore mis au point un système efficace pour éviter les collisions d'aéronefs et améliorer ainsi la sécurité de la navigation aéronautique, compte tenu notamment de leur vitesse de plus en plus grande, mais qu'un tel système s'impose d'urgence;
b) Que si, une fois mis au point, ce système exigeait l'emploi de fréquences radioélectriques, il devrait fonctionner dans l'une des bandes attribuées au service de radionavigation aéronautique;
c) Qu'il est impossible de prévoir, à l'heure actuelle, si les bandes attribuées au service de radionavigation aéronautique conviendront pour un tel système;

recommande

que les administrations et l'Organisation de l'aviation civile internationale (OACI) accordent une attention spéciale aux travaux de mise au point d'un système efficace pour éviter les collisions entre aéronefs, en tenant compte du fait que si des fréquences radioélectriques se révèlent nécessaires et si les bandes attribuées au service de radionavigation aéronautique ne conviennent pas à ce système, il y aura lieu d'étudier la question sur une base internationale.

---

(1) Remplace la Recommandation Nº 20 de la Conférence administrative des radiocommunications (Génève, 1959).

XD

RECOMMANDATION Nº 602

Relative aux radiophares maritimes

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que les radiophares maritimes sont régis dans la Zone européenne maritime par l'«Arrangement régional concernant les radiophares maritimes dans la Zone européenne de la Région 1, Paris, 1951» appelé ci-après «Arrangement de Paris, 1951»;

b) Que l'Arrangement de Paris, 1951, est largement fondé sur la disposition géographique des radiophares existants avant 1939 et sur la situation de la navigation maritime à cette époque;

c) Que, depuis la conclusion de l'Arrangement de Paris, 1951, la disposition géographique et certaines caractéristiques des radiophares maritimes ont été modifiées par accords bilatéraux ou multilatéraux pour tenir compte, en particulier, des changements intervenus dans les habitudes ou la réglementation de la navigation maritime dans la zone concernée;

d) Que l'Arrangement de Paris, 1951, est essentiellement fondé sur l'utilisation radiogoniométriques auditifs;

e) Qu'on assiste, depuis plusieurs années, à une augmentation importante du nombre de récepteurs radiogoniométriques, qui ne font appel qu'à l'onde porteuse des radiophares et qui, d'autre part, n'utilisent pas la modulation pour séparer les radiophares fonctionnant sur la même fréquence;

f) Qu'il est donc souhaitable qu'à la suite de l'examen des caractéristiques techniques de fonctionnement des radiophares maritimes par une conférence administrative mondiale des radiocommunications compétente, une conférence spécialisée soit convoquée sur la base de l'article 32 de la Convention internationale des télécommunications (Malaga-Torremolinos, 1973), afin de procéder à la révision de l'Arrangement de Paris, 1951;

g) Que cet examen devrait concerner tant l'étendue de la zone intéressée par l'Arrangement que les caractéristiques techniques de portée, de valeur du champ aux limites de portée, d'espacement entre canaux adjacents, de taux de modulation ainsi que toute autre disposition jugée nécessaire;

notant

L'existence au chapitre VIII du Règlement des radiocommunications (article 35, section IV, paragraphe C «Radiophares maritimes») des dispositions des numéros **2860** à **2866**;

L'existence au chapitre III (article 8, section 1) du numéro **405** qui définit la Zone européenne maritime;

recommande

1. Que les administrations concernées examinent la question des limites de la zone couverte par l'Arrangement et soumettent des propositions à ce sujet à la prochaine conférence administrative mondiale des radiocommunications compétente;

2. Que toutes les administrations et le CCIR portent d'urgence leur attention sur les caractéristiques techniques des radiophares maritimes et soumettent leurs conclusions à ce sujet à la prochaine conférence administrative mondiale des radiocommunications compétente;

invite le Conseil d'administration

à prendre les mesures nécessaires pour que les questions relatives aux stations de radiophares maritimes, que intéressent les services mobiles, soient inscrites à l'ordre du jour de la prochaine conférence administrative mondiale des radiocommunications pour les services mobiles, de telle manière que cette dernière puisse envisager une modification des articles pertinents du Règlement des radiocommunications;

prie le Secrétaire général

de communiquer le texte de cette Recommandation à l'Organisation consultive intergouvernementale de la navigation maritime (OMCI) et à l'Association internationale de signalisation maritime (AISM).

ZH

RECOMMANDATION Nº 603

Relative aux dispositions techniques concernant les radiophares maritimes dans la Zone africaine (1)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

(1) Remplace la Recommandation Nº 21 de la Conférence administrative des radiocommunications (Génève, 1959).

considérant

la nécessité de faciliter l'établissement de nouveaux radiophares maritimes dans la bande 283,5-315 kHz, particulièrement dans les localités voisines des Zones européenne et africaine;

recommande

que les administrations des pays de la zone africaine adoptent des dispositions analogues à celles de l'Arrangement régional concernant les radiophares maritimes dans la Zone auropéenne de la Région 1.

XI RECOMMANDATION N° 604

Relative à l'utilisation future et aux caractéristiques des radiobalises de localisation des sinistres (1)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que selon les termes de l'article 39 du Règlement des radiocommunications, les signaux des radiobalises de localisation des sinistres ont pour but essentiel de faciliter le repérage de la position de naufragés au cours des opérations de recherche et de sauvetage;

b) Que la Résolution A.91 (IV) de l'Organisation intergouvernementale consultive de la navigation maritime (OMCI) indique que les radiobalises de localisation des sinistres sont destinées principalement au radioralliement, elles peuvent néanmoins être utilisées pour l'alerte lorque les circonstances s'y prêtent;

c) Que par sa Résolution A.217 (VII), l'OMCI recommande aux administrations d'exiger que tous les navires soient équipés, si cela convient, de radiobalises de localisation des sinistres fonctionnant sur les fréquences radioélectriques les plus appropriées;

d) Que l'OMCI envisage actuellement l'équipement obrigatoire de tous les navires à passagers et les navires de charge de jauge brute supérieure ou égale à 300 tonneaux avec des radiobalises de localisation des sinistres;

considérant en particulier

que dans sa Résolution A.279 (VIII), l'OMCI a souligné le besoin urgent d'uniformiser les caractéristiques des radiobalises de localisation des sinistres;

constant

a) Que dans le Règlement des radiocommunications, il existe pour les radiobalises de localisation des sinistres, des dispositions relatives aux fréquences 2182 kHz, 121,5 MHz et 243 MHz;

b) Que la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971), en ce qui concerne les radiobalises de localisation des sinistres, a réservé la bande de fréquences 406-406,1 MHz au service mobile par satellite, uniquement pour l'utilisation et le développement de systèmes de radiobalises de localisation de sinistres à faible puissance faisant appel à des techniques spatiales;

c) Que la Résolution A.91 (IV) de l'OMCI recommande que la fréquence porteuse de 2182 kHz soit utilisée comme fréquence de premier choix pour les radiobalises de localisation des sinistres;

d) Que les caractéristiques techniques des radiobalises de localisation des sinistres fonctionnant sur la fréquence porteuse 2182 kHz sont spécifiées dans l'article 39 du Règlement des radiocommunications et dans son appendice 37 ainsi que dans l'Avis 439 du CCIR;

e) Qu'aux termes de la Résolution 601 les radiobalises de localisation des sinistres fonctionnant sur les fréquences 121,5 MHz ou 243 MHz doivent être conformes aux Avis pertinents du CCIR ainsi qu'aux normes et pratiques recommandées de l'Organisation de l'aviation civile internationale (OACI);

recommande

1. Que compte tenu des sujets d'intérêt commun qu'elles ont dans ce demaine, l'OMCI et l'OACI soient invitées à réexaminer dans les délais les plus brefs, leurs concepts sur les radiobalises de localisation des sinistres pour ce qui est des opérations de recherche et de sauvetage et de la sauvegarde de la vie humaine en mer;

2. Qu'après que l'OMCI et l'OACI auront précisé leurs conceptions, le CCIR soit prié d'étudier les questions techniques et d'exploitation propres aux radiobalises de localisation des sinistres, y compris les fréquences préférées, notamment pour ce qui est des besoins fondamentaux du radioralliement et des caractéristiques techniques de ces radiobalises, compte tenu de la nécessité de leur uniformisation.

---

(2) Remplace la Recommandation N° Mar2-12 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).

XA

RECOMMANDATION Nº 605

Relative aux caractéristiques techniques et aux fréquences des répondeurs à bord des navires (1) (2)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que le tonnage et la vitesse des navires de commerce s'accroissent dans le monde entier;
b) Que chaque année, un grand nombre de navires marchands sont victimes de collisions entraînant des pertes de vies humaines et de biens, et que ces collisions comportent des risques élevés pour l'environnement naturel;
c) Qu'il importe d'établir une corrélation entre les cibles radar et les navires faisant des émissions radiotéléphoniques à ondes métriques;
d) Que des études et des essais ont montré que les répondeurs à bord des navires peuvent rendre plus visibles et améliorer les images des cibles radar par rapport aux images radar normales;
e) Que les études en cours et les essais relatifs aux répondeurs à bord des navires montrent que l'on peut s'attendre à brève échéance à un développement de ces appareils, ce qui permettra une amélioration adéquate des images radar et une identification des cibles radar, et offrira éventuellement des possibilités de transmission de données;
f) Qu'il peut être nécessaire de protéger ces répondeurs contre les brouillages;
g) Qu'il convient que le choix des caractéristiques techniques de ces répondeurs soit coordonné avec les autres utilisateurs du spectre des fréquences radioélectriques dont les opérations pourraient être gênées;

demande au CCIR

de recommander, après consultastion des organisations internationales appropriées, l'ordre de grandeur des fréquences et des largeurs de bande requises à cet effet et convenant le mieux, ainsi que les caractéristiques techniques auxquelles doivent satisfaire de tels dispositifs, en tenant compte de la compatibilité électromagnétique avec les autres services auxquels la même bande de fréquences est attribuée;

invite

les administrations et l'Organisation intergouvernementale consultive de la navigation maritime (OMCI) à continuer d'étudier les avantages qui pourraient résulter, pour l'exploitation, de l'utilisation, généralisée de répondeurs à bord des navires, et à examiner s'il y aurait avantage à adopter, en vue de le mettre en œuvre ultérieurement, un système approuvé sur le plan international;

recommande

qu'en attendant des développements et des évaluations plus avancés de nature technique ou ayant trait à l'exploitation, les administrations se préparent à prendre, lors de la prochaine conférence administrative mondiale des radiocommunications compétente, les mesures nécessaires pour l'utilisation de tels dispositifs.

ZT

RECOMMANDATION Nº 620

Relative au service des auxiliaires de la météorologie dans la bande 27,5-28 MHz (3)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

recommande

aux administrations qui ont assigné des fréquences de la bande 27,5-28 MHz aux stations du service des auxiliaires de la météorologie de prendre des dispositions pour transférer ces assignations, aussitôt que possible, dans des bandes plus élevées, attribuées au même service;

invite l'Organisation météorologique mondiale

à étudier cette question et à procéder, le cas échéant, à la coordination nécessaire entre les administrations.

---

(1) Récepteur-émetteur qui émet automatiquement un signal lorsqu'il reçoit l'interrogation voulue.
(2) Remplace la Recommandation Nº Mar2-14 de la Conférence administrative mondiale des radiocommunications maritimes (Génève, 1974).
(3) Remplace la Recommandation Nº 33 de la Conférence administrative des radiocommunications maritimes (Génève, 1959).

XC RECOMMANDATION Nº 700

Relative à l'utilisation et au partage des bandes de fréquences attribuées aux radiocommunications spatiales (1)

La Conférence Administrative Mondiale de Radiocommunications (Génève, 1979),

considérant

les Résolutions 1721 (XVI), partie D, et 1802 (XVII), partie IV.3, de l'Assemblée générale des Nations Unies, dans chacune desquelles est notamment mentionnée la conviction des Membres des Nations Unies que les systèmes de télécommunication par satellites doivent être organisés sous une forme mondiale et d'une manière telle que tous les pays puissent y avoir accès sans aucune discrimination;

considérant de plus

les conséquences d'ordre économique et social qu'entraînera pour toutes les nations l'introduction d'un système de télécommunication mondial par satellite, comme l'a mis en lumière un rapport établi à l'intention des Membres et Membres associés de l'UNESCO en exécution d'une décision prise en décembre 1962 par la 12ème session de la Conférence générale de cette institution;

reconnaissant

que les Membres de l'Union internationale des télécommunications ont tous intérêt à utiliser de manière equitable et rationnelle les bandes de fréquences attribuées aux radiocommunications spatiales et qu'ils ont le droit de les utiliser ainsi;

recommande aux Membres de l'Union

que l'utilisation et l'exploitation des bandes de fréquences attribuées aux radiocommunications spatiales soint soumises à des accords internationaux fondés sur des principes de justice et d'équité et de nature à permettre l'utilisation et le partage de ces bandes dans l'intérêt mutuel de toutes les nations.

YY RECOMMANDATION Nº 701

Relative à l'utilisation de la bande de fréquences 1330-1400 MHz par le service de radioastronomie

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que les observations de rayonnements radioélectriques d'atomes d'hydrogène neutre, dans la bande 1330-1400 MHz, ont une importance primordiale pour la compréhension de la structure de galaxies lointaines et, par conséquent, de l'évolution de l'univers;
b) Que le service de radioastronomie a été inscrit dans le Tableau d'attribution des bandes de fréquences dans la bande 1330-1400 MHz;
c) Que le service de radioastronomie se consacre à la réception de rayonnements électromagnétiques de niveau extrêmement faible, d'origine extra-terrestre, et qu'il doit être protégé des rayonnements artificiels dans toute la mesure du possible;
d) Que la possibilité, pour le service de radioastronomie, de partager des bandes de fréquences avec d'autres services est limitée;

recommande

1. Qu'en préparant leurs propositions pour la prochaine conférence administrative des radiocommunications compétente, les administrations étudient les dispositions à prendre, dans la bande 1330-1400 MHz, afin d'assurer au service de radioastronomie une protection accrue contre d'autres services qui produisent des rayonnements;

2. Que, lorsqu'elles établissent des plans d'assignations de fréquence, les administrations tiennent compte que des observations de radioastronomie sont effectuées dans la bande 1330-1400 MHz.

YU RECOMMANDATION Nº 702

Relative à l'utilisation des bandes de fréquences 1400-1727 MHz, 101-120 GHz et 197-220 GHz pour la recherche d'émissions intentionnelles d'origine extra-terrestre

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

---

(1) Remplace la Recommandation Nº Spa 10 de la Conférence administrative extraordinaire des radiocommunications (Génève, 1963).

considérant

a) Qu'il est particulièrement important pour l'humanité de déterminer s'il existe des civilisations extra-terrestres;
b) Que c'est dans les bandes 1400-1727 MHz, 101-120 GHz et 197-220 GHz que la probabilité de déceler un signal émis par une civilisation extra-terrestre est la meilleure, parce que ces bandes contiennent des raies spectrales dont l'intérêt es fondamental en physique et qui sont liées aux phénomènes universels;
c) Que, dans les bandes mentionnées au *considérant b*), il existe une probabilité de déceler avec un rapport signal/bruit maximal, un rayonnement émis par des civilisations extra-terrestres;
d) Que la recherche de civilisations extra-terrestres a été inscrite dans les bandes 1400-1727 MHz, 101-120 GHz et 197-220 GHz du Tableau d'attribution des bandes de fréquences;
e) Que les tentatives visant à reconnaître des signaux émanant de civilisation extra-terrestres supposent la réception de rayonnements de niveau extrêmement faible, et que cette réception doit par conséquent être protégée par des rayonnements artificiels dans toute la mesure du possible;
f) Que, pour la réception de signaux émis par une civilisation extra-terrestre, il y a très peu de possibilités de partager des bandes de fréquences avec des services radioélectriques actifs;

recommande

qu'en préparant leurs propositions pour la prochaine conférence administrative des radiocommunications compétente, les administrations étudient l'opportunité de prendre des dispositions visant à assurer, dans les bandes 1400-1727 MHz, 101-120 GHz et 197-220 GHz, un environnement protégé approprié à la réception de rayonnements d'origine extra-terrestre;

invite

les organisations intéressées à la recherche de civilisations extra-terrestres à prendre en considération les points suivants:

1. Les dispositions pertinentes di Règlement des radiocommunications;
2. La nécessité de maintenir une coordination étroite avec leurs administrations nationales en matière d'utilisation des fréquences;
3. La nécessité de choisir, pour les installations de récéption servant à ces observations, des emplacements aussi éloignés que possible des sources de brouillage radioélectrique;
4. Les Rapports et Avis pertinents du CCIR.

ZU RECOMMANDATION Nº 703

Relative à la nécessité de faire cesser le fonctionnement des stations des services fixe et mobile dans les bandes de fréquences 149,9-150,05 MHz et 399,9-400,05 MHz attribuées au service de radionavigation par satellite (1)

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que les bandes de fréquences 149,9-150,05 MHz et 399,9-400,05 MHz ont été attribuées en exclusivité, dans le monde entier, au service de radionavigation par satellite;
b) Que de nombreuses administrations ont besoin de délais prolongés pour pouvoir assurer, dans d'autres bandes appropriées, le fonctionnement des services fixe et mobile existants;
c) Qu'il est de l'intérêt de toutes les administrations que le service de radionavigation par satellite soit mis en œuvre à bref délai, notamment en ce qui concerne son application à la navigation maritime;
d) Que les brouillages causés aux utilisateurs du service de radionavigation par satellite pourraient mettre en danger la sécurité de la vie humaine et des biens;
e) Que le CCIR étudie actuellement les possibilités de partage des bandes de fréquences entre le service de radionavigation par satellite et les services de Terre, mais qu'il n'est pas encore en mesure de formuler de conclusions à cet égard;

recommande

1. Que, dans l'attente d'une conclusion positive du CCIR concernant la possibilité de partage entre les stations du service de radionavigation par satellite et les services fixe et mobile, les administrations prennent toutes les mesures possibles pour protéger contre les brouillages préjudiciables le fonctionnement des stations terriennes mobiles faisant usage du service de radionavigation par satellite;
2. Que, à la lumière des dispositions du paragraphe précédent, les administrations soient invitées à mettre, dès que possible, un terme au fonctionnement des stations des services fixe et mobile dans les bandes 149,9-150,05 MHz et 399,9-400,05 MHz, notamment de celles qui sont situées dans des régions côtières.

---

(1) Remplace la Recommandation Nº Spa 8 de la Conférence administrative extraordinaire des radiocommunications (Génève, 1963).

ZV RECOMMANDATION N° 704

Relative à la compatibilité entre le service de radiodiffusion dans la bande 100-108 MHz et le service de radionavigation aeronáutique dans la bande 108-117,975 MHz

La Conférence administrative mondiale de radiocommunications (Génève, 1979),

considérant

a) Que la radiodiffusion en ondes métriques est de plus utilisée avec des puissances élevées, dans la bande 100-108 MHz;
b) Que la bande 108-117,975 MHz est utilisée mondialement par des systèmes de radionavigation aéronautique agrées au plan international;
c) Que la partie de la bande comprise entre 108 MHz et 111,975 MHz est utilisée par les systèmes d'atterrissage aux instruments (ILS), employés par les aéronefs pour l'atterrissage automatique;
d) Que la bande comprise entre 108 MHz et 117,975 MHz est utilisée par le système de radiophare d'alignement omnidirectionnel à ondes métriques (VOR);
e) Que, dans certains parties des Régions 3 et 3, des brouillages se sont produits entre le service de radiodiffusion et le service de radionavigation aéronautique;

consciente

a) Que les produits d'intermodulation provenant de combinaisons d'émissions de radiodiffusion peuvent tomber dans la bande 108 MHz et 117,975 MHz attribuée au service de radionavigation aéronautique;
b) Que des produits d'intermodulation peuvent se former dans le récepteur de radionavigation;
c) Que des émissions de radiodiffusion à grande puissance peuvent entraîner le blocage des récepteurs de radionavigation;
d) Que les émissions du service de radionavigation aéronautique peuvent causer des brouillages au service de radiodiffusion;

prie le CCIR

1. D'étudier d'urgence le problème des brouillages entre les deux services;
2. De déterminer les critères appropriés de protection des deux services;

invite

l'Organisation de l'aviation civile internationale (OACI) et les autres organisations internationales appropriées à étudier d'urgence le problème et à communiquer les résultats de leurs études au CCIR;

recommande

qu'en assignant des fréquences au service de radiodiffusion dans la bande 100-108 MHz et au service de radionavigation aéronautique dans la bande 108-117,975 MHz, les administrations prennent note des risques possibles de brouillage et appliquent des mesures de protection appropriées.

T RECOMMANDATION N° 705

Relative aux critères à appliquer au partage des fréquences entre le service de radiodiffusion par satellite et le service de radiodiffusion de Terre dans la bande 620-790 MHz (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que des fréquences de la bande 620-790 MHz peuvent être assignées à des stations de télévision modulation de fréquence du service de radiodiffusion par satellite;
b) Qu'il est nécessaire de fixer une limite de la puissance surfacique afin de protéger efficacement le service de radiodiffusion de Terre;

(1) Remplace la Recommandation N° Spa2-10 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

notant

a) Que, dans ces conclusions, la Reúnion spéciale mixte du CCIR (Génève, 1971) a indiqué les limites suivantes de la puissance surfacique afin de protéger le service de radiodiffusion de Terre:

— 121 dB (W/m²)	pour $\delta \leq 20°$
— 121 + 0,4 (δ – 20) dB (W/m²)	pour $20° < \delta \leq 60°$
— 105 dB (W/m²)	pour $60° < \delta \leq 90°$

δ étant l'angle d'arrivé au-dessus du plan horizontal (en degrés);

b) Que des essais supplémentaires effectués par une administration après la Réunion spéciale mixte du CCIR ont montré qu'il peut être nécessaire d'adopter les valeurs suivantes, plus prudentes, pour les limites de puissance surfacique:

— 130 dB (W/m²)	pour $\delta \leq 20°$
— 130 + 0,4 (d – 20) dB (W/m²)	pour $20° < \delta \leq 60°$
— 114 dB (W/m²)	pour $60° < \delta \leq 90°$

δ étant l'angle d'arrivé au-dessus du plan horizontal (en degrés);

c) Que le Rapport 631-1 du CCIR donne le résultat des études effectuées jusqu'en 1978;

d) Qu'il est nécessaire de recueillir des renseignements supplémentaires sur le rapport de protection contre le brouillage causé par un signal de télévision à modulation de fréquence à un signal de télévision à bande latérale résiduelle, tant pour les systèmes à 625 lignes qu'à 525 lignes;

e) Qu'avec les sytèmes de réception de télévision de Terre utilisant les techniques actuelles, le champ minimal à protéger peut en certains cas être inférieur aux valeurs recommandées dans l'Avis 417-2 du CCIR;

f) Que l'ont peut être amené à tenir compte des réflexions sur le sol;

g) Que la technique de dispersion de l'energie peut réduire le rapport de protection requis et qu'il convient d'y faire appel si elle se révèle efficace;

recommande

1. Qu'en raison de l'absence de renseignements suffisants sur les essais effectués dans les conditions d'exploitation, et afin de fournir des critères de partage à tire provisoire, la puissance surfacique maximale produite à la surface de la Terre dans le zone de service d'une station de radiodiffusion de Terre (voir l'Avis 417-2 du CCIR) par une station spatiale du service de radiodiffusion par satellite ne dépasse pas les valeurs suivantes dans la bande 620-790 MHz:

— 129 dB (W/m²)	pour $\delta \leq 20°$
— 129 + 0,4 (δ – 20) dB (W/m²)	pour $20° < \delta \leq 60°$
— 113 dB (W/m²)	pour $60° < \delta \leq 90°$

δ étant l'angle d'arrivé au-dessus du plan horizontal (en degrés);

2. Que ces limites ne soient dépassées sur le territoire d'un pays que sous réserve de l'accord de l'administration de celui-ci;

3. Que l'on évite d'émettre des porteuses non modulées;

4. Que le CCIR étudie d'urgence les critères à appliquer pour le partage des fréquences entre le service de radiodiffusion par satellite et le service de radiodiffusion de Terre dans la bande 620-790 MHz et qu'il rédige un Avis sur les valeurs de la puissance surfacique à utiliser pour remplacer les limites provisoires indiqués ci-dessus;

5. Que, dans ses études, le CCIR prenne en considération, en particulier, les facteurs suivants:

5.1. Rapport de protection requis contre le brouillage causé par un signal de télévision à modulation de fréquence à un signal de télévision à bande latérale residuelle, tant pour les systèmes à 525 lignes qu'à 625 lignes;

5.2. Champ minimal à protéger pour le service de télévision de Terre, compte tenue de l'état de la technique;

5.3. Effet des réflexions sur le sol;

5.4. Nombre des satellites de radiodiffusion visibles d'un récepteur de radiodiffusion de Terre;

5.5. Effet de la discrimination de polarisation;

5.6. Effet de la directivité de l'antenne;

6. Que, dans ses études, le CCIR examine les avantages de la technique de dispersion de l'energie dans le service de radioddifusion par satellite (télévision).

YW RECOMMANDATION Nº 706

Relative au partage des fréquences entre, d'une part le service d'exploitation de la Terre par satellite (détecteurs passifs) et le service de recherche spatiale (détecteurs passifs), et d'autre part les services fixe, mobile, sauf mobile aéronautique, et fixe par satellite dans la bande 18,6–18,8 GHz.

La Conferénce administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que des attributions aux services d'exploration de la Terre par satellite et de recherche spatiale pour le fonctionnement des détecteurs passifs à bord d'engins spatiaux ont été faites dans diverses bandes de fréquences;

b) Que les attributions faites dans la bande 18,6-18,8 GHz le sont en partage avec les services fixe, mobile, sauf mobile aéronautique, et fixe pr satellite;

c) Que l'application des critères de partage contenus dans le Rapport 694 du CCIR pourrait limiter le développement des services fixe, mobile, sauf mobile aéronautique, et fixe par satellite;

invite le CCIR

1. À faire réexaminer le contenu du Rapport 694 par toutes les commissions d'études concernées (notamment les Comissions d'études 4 et 9);

2. À poursuivre les études ayant déjà donné lieu au Rapport 609-1, en tenant compte des besoins des services d'exploration de la Terre par satellite (détecteurs passifs) et de recherche spatiale (décteurs passifs);

3. À étudier les restrictions minimales qui pourraient être appliquées aux services fixe, mobile, sauf mobile aéronautique, et fixe par satellite (espace vers Terre) pour assurer un fonctionnement satisfaisant des detécteurs passifs;

4. À étudier les restrictions maximales que peuvent tolérer les services fixe, mobile, sauf mobile aéronautique et fixe par satellite, sans compromettre le fonctionnement de tous les services susceptibles d'utiliser cette bande de fréquences.

YV RECOMMANDATION Nº 707

Relative à l'utilisation de la bande de fréquences 32-22 GHz en partage entre le service inter-satellites et le service de radionavigation

La Conferénce administrative mondiale des radiocomnunications (Génève, 1979),

considérant

a) Que la bande 32-33 GHz est attribuée au service inter-satellites et au service de radionavigation;

b) Que le service de radionavigation présente des aspects de sécurité;

c) Que le renvoie 893 a été inclus dans l'article 8;

recommande

que des études soient entreprises d'urgence, concernant les critères à appliquer pour le apartage de la bande de fréquences 32-33 GHz entre les deux services précités;

prie le CCIR

d'effectuer ces études;

recommande en outre

qu'une future conférence administrative mondiale des radiocommunications compétente passe en revue les Avis du CCIR, dans le but d'inclure les critères de partage susmentionnées dans l'article 28.

ZQ RECOMMANDATION Nº 708

Relative aux bandes de fréquences partagées par les srvices de radiocommunication spatiale entre eux ainsi qu'entre les services de radiocommunication spatiale et les services de radiocommunication de Terre (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

reconnaisant

a) La valeur, pour la Conférence, de la documentation contenue dans le Rapport de la Réunion spéciale préparatoire du CCIR (Génève, 1978);

---

(1) Remplace la Recommandation Nº Spa2-15 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

b) Le fait de la XIV[e] Assemblée plénière du CCIR a aprouvé un certain nombre de Questions et de Programmes d'études au titre desquels ce Comité doit encore étudier des problèmes très divers concernant les radiocommunications spatiales;

considérant cependant

a) Que certains Avis du CCIR, dont la liste suit, nécessitent la poursuite des travaux et des études;

Avis 335-2 «Partage de fréquences entre systèmes du service fixe par satellite et des services de radiocommunication de Terre fonctionant dans la même bande de fréquences»;

Avis 465-1 «Diagramme de rayonnement de réference de station terrienne, à utiliser pour la coordination et pour l'évaluation des brouillages dans la gamme des fréquences comprises entre 2 et 10 GHz environ»;

Avis 466-2 «Niveau maximal admissible du brouillage, dans une voie téléphonique d'un réseau à satellite géostationnaire du service fixe par satellite utilisant la modulation de fréquence avec multiplexage en fréquence, produit par d'autres réseaux de ce service»;

b) Que les débats de la présent Conférence, notamment ceux relatifs aux articles 27, 28 et 29 et aux autres articles pertinents du Règlement des radiocommunications, ont montré que l'on a besoin de renseigments supplémentaires pour répondre aux Questions et Programmes d'études ci-aprées en cours d'examen par le CCIR:

Question 1-2/4 «Antennes pour le systèmes du service fixe par satellite»;

Question 2-3/4 «Caractéristiques techniques des systèmes du service fixe par satellite»;

Programme d'études 2A-3/4 «Possibilité de partage des bandes de fréquences entre les systèmes du service fixe par satellite et les services de radiocommunication de Terre»;

Programme d'études 2J-2/4 «Facteurs techniques dont dépende l'efficacité d'utilisation de l'orbite des satellites géostationnaires par des réseaux à satellite de radiocommunication partageant des bandes de fréquences attribuées au service fixe par satellite»;

c) Qu'il serait utile de connaître les valeurs numériques précises de la puissance surfacique produite par les stations spatiales du service de radiodiffusion par satellite, qui permettraient d'établir une distinction entre la «réception individuelle» et la «réception communautaire» dans le service de radiodiffusion par satellite;

d) Que le partage des fréquences entre le service de radionavigation et le service fixe par satellite (Terre vers espace) a été adopté dans la bande de fréquences 14-14,3 GHz;

recommande

1. Aux administrations, exploitations privées reconnues et autres participants aux travaux du CCIR, de donner une priorité à la présentation de contributions à l'étude des questions précitées, de manière que des projets d'Avis puissent être préparés lors des réunions des Comissions d'études compétentes aux fins d'examen par l'Assemblée plénière du CCIR:

2. Au CCIR, d'étudier, ou, selon le cas, de continuer à étudier:

2.1. Les diagrammes de référence d'antennes de station terrienne qui pourraient convenir à la fixation de normes de fonctionnement minimales, en vue de recommander des diagrammes à cette fin pour améliorer l'utilisation des bandes de fréquences partagées entre le service fixe par satellite et les services de radiocommunication de Terre ainsi qu'entre services de radiocommunication spatiale et améliorer l'utilisation de l'orbite des satellites géostationnaires;

2.2. Les diagrammes de référence d'antennes de satellite qui pourraient convenir à la fixation de normes de fonctionnement minimales, notamment en dehors du faisceau de rayonnement principal, pour améliorer l'utilisation de l'orbite des satellites géostationnaires et pour accoître les possibilités de réutilisation des fréquences;

2.3. Les diagrammes de réference d'antennes à polarisation croisées qui pourraient convenir à la fixation de normes de fonctionnement minimales et, à cet égard, d'étudier également:

2.3.1. Les parties du spectre des fréquences dans lesquelles, il serait le plus avantageux d'utiliser des polarisations orthogonales linéaires ou des polarisations orthogonales circulaires;

2.3.2. L'opportunité, compte tenu de facteurs techniques et de considérations relatives à l'utilisation de l'orbite, d'utiliser des polarisations orthogonales dans un même satellite comparativement à une telle utilisation dans deux satellites;

2.4. Les limites à imposer aux rayonnements non essentiels ainsi que les tolérances de fréquence dans les services de radiocommunication spatiale et les services de radiocommunication de Terre, dans la mesure où ces limites et ces tolérances peuvent affecter le partage des bandes de fréquences;

2.5. Les critères de brouillage admissible pour les divers services de radiocommunication spatiale et de radiocommunication de Terre partageant les bandes de fréquences attribuées par la présente Conférence, afin de permettre la détermination:

2.5.1. De la distance de coordination et de la probabilité de brouillage entre stations en-deçà de cette distance;

2.5.2. Des limites à imposer à la puissance surfacique produite à la surface de la Terre par les stations spatiales;

2.6. Le niveaux maximal de brouillage admissible pouvant être causé à une liaison par satellite géostationnaire par tout autre réseau à satellite géostationnaire et par l'ensemble de tous les autres réseaux à satellite géostationnaire, en particulier dans le cas:

2.6.1. De signaux téléphoniques modulés en fréquence;

2.6.2. De signaux de télévision modulés en fréquence;

2.6.3. De signaux à modulation numérique;

ainsi que la manière la plus appropriée dont il convient de spécifier ces brouillages admissibles dans ces cas et dans d'autres cas;

2.7. Les critères de brouillage à appliquer au partage de fréquences entre réseaux à satellite non géostationnaire et réseaux à satellite géostationnaire;

2.8. La possibilité d'établir un critère technique pour exprimer l'efficacité d'utilisation de l'orbite des satellites géostationnaires;

2.9. La possibilité d'améliorer et de simplifier la méthode permettant de déterminer la zone de coordination, telle qu'elle est décrite dans l'appendice 28 au Règlement des radiocommunications;

2.10. Les conditions de partage des fréquences dans les bandes attribuées par la présente Conférence au service de radiodiffusion par satellite, en vue d'émettre aussitôt que possible des Avis appropriés permettant aux administrations et à l'IFRB de disposer des données techniques nécessaires pour appliquer les procédures d'examen, nottamment celles qui sont énoncées aux articles 11, 12 et 13 du Règlement des radiocommunications et dans le Résolution **33**;

2.11. La détermination des niveaux de puissance surfacique requis pour la réception individuelle et la réception communautaire dans le service de radiodiffusion par satellite, en vue de spécifier des valeurs numériques qui permettront d'établir une distinction entre ces types de réception;

2.12. Les critères de partage des fréquences entre le service de radionavigation et le service fixe par satellite (Terre vers espace) dans la bande de fréquences 14-14,3 GHz;

O RECOMMANDATION Nº 709

Relative au partage des bandes de fréquences entre le service mobile aéronautique et le service inter-satellites

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que les bandes 54,25-58,2 GHz, 59-64 GHz, 116-134 GHz, 170-182 GHz et 185-190 GHz sont attribuées au service inter-satellites et au service mobile;

b) Que les bandes susmentionnées son situées dans des parties du spectre des fréquences radioélectriques voisines de crêtes d'absorpotion aunosphérique;

c) Que, néanmoins, l'absorption aunonsphérique elle seule ne suffit pas toujours pour empêcher que des brouillages préjudiciables soient causés aux stations du service inter-satellites par des stations fonctionnant à bord d'aéronefs volant à haute altitude;

d) Que, pour cette raison, les stations d'aéronef du service mobile aéronautique peuvent fonctionner sous réserve de ne pas causer de brouillage préjudiciable au service inter-satellite (voir le numéro **909** dont le text est reproduit ci-après) (1);

recommande

que l'on procède d'urgence à des études des critères de partage applicables à ces deux services dans les bandes de fréquences susmentionnés;

prie le CCIR

d'effectuer ces études;

recommande en outre

qu'une future conférence administrative mondiale des radiocommunications compétente examine à nouveaux les attributions dans ces bandes, compte tenu des résultats des travaux du CCIR.

---

(1) **909** Dans les bandes 54,25-58,2 GHz, 59-64 GHz, 116-134 GHz, 170-182 GHz et 185-190 GHz, les stations du service mobile aéronautique peuvent fonctionner sous réserve de ne pas causer de brouillage préjudiciable au service inter-satellites (voir le numéro **435**).

N

RECOMMANDATION Nº 710

Relative à l'utilisation de radiodétecteurs aéroportés dans les bandes de fréquence partagées par le service inter-satellites et le service de radiolocalisation

La Conférence administrative mondiale des radiocommunications (Genève, 1979),

considérant

a) Que les bandes 59-64 GHz et 126-134 GHz sont attribuées au service inter-satellites et au service de radiolocalisation;

b) Que les bandes susmentionnées sont situées dans les parties du spectre des fréquences radioélectriques voisines de crêtres d'absorption atmosphérique;

c) Que, néanmoins, l'absorption atmosphérique à elle seule en suffit pas toujours pour empêcher que des brouillages préjudiciables soient causés à des stations du service inter-satellites par des radiodécteurs fonctionnant à bord d'aéronefs volant à haute altitude;

d) Que, pour cette raison, les radiodétecteurs aéroportés du service de radiolocalisation peuvent fonctionner sous réserve de ne pas causer de brouillage préjudiciable au service inter-satellites (voir le numéro **910,** dont le texte est reproduit ci-après) (1);

recommande

que l'on procède d'urgence à des études des critères de partage applicables à ces deux services dans les bandes de fréquences susmentionnées;

prie le CCIR

d'effectuer ces études;

recommande en outre

qu'une future conférence administrative mondiale des radiocommunications compétente examine à nouveau les attributions dans ces bandes, compte tenu des résultats des travaux du CCIR.

Z

RECOMMANDATION Nº 711

Relative à la coordination des stations terriennes (2)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Qu'aux termes de l'article 11 du Règlement des radiocommunications, les assignations de fréquence aux stations terriennes das certaines bandes partagées, avec égalité des droits, entre services de radiocommunication de Terre et services de radiocommunication spatiale, doivent faire l'objet d'une coordination de façon à éviter les brouillages préjudiciables mutuels;

b) Que la méthode de calcul décrite à l'appendice 28 au Règlement des radiocommunications s'applique seulement aux fréquences de la gamme de 1 GHz à 40 GHz;

c) Que les Tableaux I et II de cet appendice ne comportent pas les valeurs numériques de tous les paramètres nécessaires pour certains services de radiocommunication spatiale et pour certains services de radiocommunication de Terre partageant des bandes de fréquences avec egalité des droits;

invite le CCIR

à poursuivre d'urgence ses études:

Sur les données relatives aux services de radiocommunication spatiale et de radiocommunication de Terre partageant des bandes de fréquences avec egalité des droits, qui ne figurent pas dans les Tableaux I et II de l'appendice 28 au Règlement des radiocommunications;

Sur l'élaboration de méthodes de calcul permettant de determiner la zone de coordination des stations terriennes pour les fréquences inférieures à 1 GHz et supérieures à 40 GHz;

---

(1) **910** Dans les bandes 59-64 GHz et 126-134 GHz, les radiodétecteurs aéroportés du service de radiolocalisation peuvent fonctionner sous réserve de ne pas causer de brouillage préjudiciable au service inter-satellites (voir le numéro **435**).

(2) Remplace la Recommandation Nº Spa2-9 de la Conférence administrative mondiale des télécommunications spatiales (Génève, 1971).

recommande aux administrations

d'utiliser jusqu'à la prochaine conférence administrative mondiale des radiocommunications compétente:

Les Avis du CCIR éventuellement applicables, pour ce qui est des valeurs qui ne figurent pas dans les Tableaux I et II de l'appendice 28 au Règlement des radiocommunications;

Les méthodes de détermination de la zone de coordination pour des fréquences inférieures à 1 GHz et supérieures à 40 GHz, qui feraient l'objet d'Avis du CCIR.

U RECOMMANDATION Nº 712

Relative à l'interdépendance entre le conception des récepteurs, le groupement des canaux et les critères de partage dans le service de radiodiffusion par satellite (1)

La Conférence administrative mondiale des radiocommunications (Génève, 1979),

considérant

a) Que la conception des récepteurs, le groupement des canaux et les critères de partage sont interdépendants et qu'ils ont une influence importante sur l'élaboration d'un plan pour le service de radiodiffusion par satellite;

b) Que, jusqu'à présent, on n'a peut-être pas accordé une attention suffisante à ces facteurs et à l'influence qu'ils exercent sur la mise en œuvre d'un tel plan;

invite le CCIR

à étudier le problème de l'interdépendance entre la conception des récepteurs, le groupement des canaux et les critères de partage, ainsi que l'influence de ces facteurs sur l'exploitation du service de radiodiffusion par satellite.

---

(1) Remplace la Recommandation Nº Sat-7 de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977).

APPENDICE 25 Mar2

Plan d'allotissement de fréquences aux stations côtières radiotéléphoniques fonctionnant dans les bandes exclusives du service mobile maritime entre 4000 kHz et 23 000 kHz

(Voir les numéros 448 et 457 du Règlement des radiocommunications et l'appendice 17 Rév.)

Note a) —Les fréquences indiquées dans la colonne (1) sont des fréquences assignées (voir le numéro **85**) telles qu'elles figurent à l'appendice 17 Rév. au Règlement des radiocommunications. Chaque fréquence est suivie, entre parenthèses, de l'indication de la fréquence porteuse ainsi que du numéro de la voie. (Voir la Section A de l'appendice 17 Rév. au Règlement des radiocommunications.)

Note b) — Les stations côtières radiotéléphoniques qui fonctionnent dans les bandes exclusives du service mobile maritime entre 4000 kHz et 23 000 kHz doivent utiliser la puissance minimale nécessaire pour couvrir leur zone de service. Elles ne doivent en aucun cas utiliser une puissance de crête supérieure à 10 kW par voie. (Voir le numéro **1351C** du Réglement des radiocommunications.)

Note c) — La mise à jour du plan figurant dans le present appendice s'effectuera conformément à la procédure qui fait l'objet de l'article 9B du Réglement des radiocommunications et qui est reproduite en annexe.

ANNEXE

Mar2 **Article 9B du Règlement des radiocommunications**

Procédure de mise à jour du Plan d'allotissement (1) de fréquences aux stations côtières radiotélégraphiques fonctionnant dans le bandes exclusives du service mobile maritime entre 4000 kHz et 23 000 kHz

(Appendice 25 Mar2)

639DY Mar2 § 1. (1) Avant de notifier au Comité international d'enregistrement des fréquences ou de mettre en service une assignation de fréquence à une station côtière radiotéléphonique pour laquelle aucun allotissement correspondant ne figure dans le Plan d'allotissement de fréquences contenu dans l'appendice 25 Mar2, toute administration qui:

a) Se propose de mettre en service une station côtière radiotéléphonique et n'a aucun allotissement dans le plan; ou

b) Se propose de développer le service radiotéléphonique assuré par sa ou ses stations côtières et a besoin d'un allotissement additionnel.

envoie au Comité au plus tôt deux années dans le cas *a*) mentionné ci-dessus, ou au plus tôt six mois dans le cas *b*) mentionné ci-dessus mais en tout cas au plus tard trois mois avant la date prévue de mise en service de son service radiotéléphonique en projet, les renseignements énumérés à l'appendice 1C.

639DZ Mar2 (2) Le Comité publie dans une section spéciale de sa circulaire hebdomadaire les renseignements dont il est question au numéro **639DY**, accompagnés des cas d'incompatibilité apparente que le Comité peut déceler entre l'allotissement en projet faisant l'objet de la publication en toute autre allotissement existant ou en projet. Le Comité fournit également toute information de caractère technique et toute suggestion qu'il peut présenter en vue d'éviter ces incompatibilités.

639EA Mar2 (3) Si la demande lui en est faite par une administration quelconque et, en particulier, par une administration d'un pays qui a besoin d'assistance spéciale, et si les circonstances paraissant le justifier, le Comité, utilisant á cet effet les moyens dont il dispose et qui conviennent aux circonstances, fournit l'assistance suivante:

a) Detérmination d'une ou de voies qui conviennent le mieux pour le service projéte par l'administration avant que celle-ci communique les renseignements à publier;

b) Application de la procédure prévue au numéro **639EB**;

c) Toute autre asssistance de caractère technique afin que les procédures décrites dans le présent article puissent être menées à bien.

639EB Mar2 § 2. (1) En même temps qu'elle envoie au Comité les renseignements énumérés à l'appendice 1C en vue de leur publication, l'administration concernée recherche, relativement à l'allotissement en question, l'accord des administrations auxquelles la voie est allotie. Elle envoie au Comité une copie de toute la correspondance y afférente.

639EC Mar2 (2) Si, après avoir étudié les renseignements publiés par le Comité, une administration est d'avis que ses services existants ou ses services en projet destinés à être mis en service dans les délais mentionnées au numéro **639DY** pourraient être défavorablement influencés, elle a le droit d'être partie à la procédure entamée aux termes du numéro **639EB**.

639ED Mar2 § 3. (1) Toute administration qui reçoit une demande aux termes du numéro **639EB** en accuse immédiatement réception, par télégramme. Si l'administration qui a envoyé la demande n'a pas reçu d'accusé de réception dans le délai de trente jours qui suit la date de la circulaire hebdomadaire dans laquelle les renseignements pertinents ont été publiés conformément aux dispositions du numéro **639DZ**, elle envoie un télégramme demandant cet accusé de réception, télégramme auquel l'administration qui le reçoit répond dans un nouveau délai de quinze jours.

639EE Mar2 (2) Au reçu de la demande faite aux termes du numéro **639EB**, l'administration intéressée étudie rapidement la question, eu égard à la date prévue de mise en service de la ou des assignations correspondant à l'allotissement pour lequel l'accord est demandé, du point de vue du brouillage nuisible qui serait causé au service assuré par sa ou ses station(s) côtière(s):

a) Qui utilise(ent) une assignation de fréquence conforme à un allotissement figurent dans le Plan, ou

b) Qui sera (seront) mise(s) en service, dans le délai prescrit au numéro **639EV**, et pour laquelle (lesquelles) un allotissement figure dans le Plan; ou

c) Qui sera (seront) mise(s) en service dans le délai prescrit au numéro **639EV**, et pour laquelle (lesquelles) un allotissement en projet a été communiqué au Comité aux termes du numéro **639DY**, aux fins de publication conformément au numéro **639DZ**.

---

(1) Voir la Resolution N.° 6.

639EF (3) Toute administration qui reçoit une demande aux termes du numéro **639EB** et qui considère que
Mar2 le projet d'utilisation d'une voie ne causera pas un brouillage nuisible au service assuré par ses stations côtières dont il est question au numéro **639EE,** communique son accord à l'administration qui le lui a demandé, le plus rapidement possible et au plus tard soixante jours après la date de la circulaire hebdomadaire pertinente.

639EG (4) Toute administration qui reçoit une demande aux termes du numéro **639EB** et qui considère que
Mar2 le projet d'utilisation d'une voie pourrait causer un brouillage nuisible au service assuré par ses stations côtières dont il est question au numéro **639EE,** communique à l'administration qui lui a envoyé la demande les raisons de son désaccord le plus rapidement possible et au plus tard soixante jours après la date de la circulaire hebdomadaire pertinente. Elle lui fournit également toute information et suggestion en vue d'arriver à une solution satisfaisante du problème. L'administration recherchant l'accord s'efforce d'adapter ses besoins, dans la mesure du possible, en prenant en considération les observations qu'elle a reçues.

639EH (5) Dans le cas où une administration recherchant un accord n'a pas d'allotissement dans la bande
Mar2 considérée, toute administration à laquelle la demande d'accord est adressée recherche, de concert avec l'administration requérente, tous les moyens de faire face aux besoins de celle-ci.

639EI § 4. (1) L'administration qui recherche un accord peut demander au Comité de s'efforcer d'obtenir
Mar2 cet accord dans les circonstances suivantes:

a) Une administration à laquelle une demande d'accord a été envoyée aux termes du numéro **639EB** n'envoie pas d'accusé de réception de cette demande dans un délai de quarante-cinq jours à partir de la date de la circulaire hebdomadaire dans laquelle les renseignements pertinents ont été publiés;

b) Une administration a envoyé un accusé de réception aux termes du numéro **639ED** mais ne communique pas sa décision dans un délai de soixante jours à partir de la date de la circulaire hebdomadaire dans laquelle les renseignements pertinents ont été publiés;

c) L'administration qui rechercher un accord et l'administration auprès de laquelle l'accord est recherché sont en désaccord sur les possibilités de partage;

d) Il n'est pas possible d'arriver à un accord pour toute autre raison.

639EJ (2) L'administration qui recherche un accord, ou toute administration à laquelle une demande d'accord
Mar2 a été adressée, ou bien le Comité, peuvent demander des renseignements supplémentaires dont ils estiment avoir besoin pour l'étude des problèmes relatifs à cet accord.

639EK (3) Lorsque le Comité reçoit une demande aux termes de l'alinéa *a*) du numéro **639EI,** il envoie
Mar2 sans délai un télégramme à l'administration intéressée en lui demandant d'en accuser réception immédiatement.

639EL (4) Lorsque le Comité reçoit un accusé de réception à la suite de la mesure qu'il a prise aux termes
Mar2 du numéro **639 EK** ou lorsque le Comité reçoit une demande aux termes de l'alinéa *b*) du numéro **639EI,** il envoie sans délai un télégramme à l'administration intéressée en lui demandant de prendre rapidement une décision sur la question.

639EM (5) Lorsque le Comité reçoit une demande aux termes de l'alinéa *d*) du numéro **639EI,** il s'efforce
Mar2 d'obtenir l'accord mentionné au numéro **639EB.** Lorsque le Comité ne reçoit pas d'une administration un accusé de réception à la demande qu'il a formulée en application des dispositions du numéro **639EB** dans le délai spécifié au numéro **639ED,** il agit, en ce qui concerne cette administration, conformément aux dispositions du numéro **639EK.**

639EN (6) Lorsqu'une administration ne répond pas dans le délai de quinze jours qui suit l'envoi du télégramme
Mar2 que le Comité lui a envoyé aux termes du numéro **639EK** en lui demandant un accusé de réception, ou lorsqu'elle ne communique pas sa décision sur la question dans le délai de trente jours qui suir l'envoi du télégramme du Comité aux termes du numéro **639EL,** l'administration est réputée s'être engagée, une fois que l'allotissement en projet est inséré dans le Plan:

a) À ne pas formuler de plainte concernant les brouillages nuisibles qui pourraient être causés au service assuré par ses station côtières radiotéléphoniques par l'utilisation d'assignations de fréquence conformes à l'allotissement pour lequel l'accord a été recherché;

b) À faire en sorte que ses stations côtières radiotéléphoniques existantes ou en projet ne causeront pas de brouillages nuisibles à l'utilisation d'assignations de fréquence conformes à l'allotissement pour lequel l'accord a été recherché.

Le Comité inscrit dans le Fichier de référence en regard de l'allotissement et des assignations qui en découlent une observation dans la colonne Observations indiquant que ces assignations ne bénéficient par des dispositions du numéro **607** du Règlement des radiocommunications en ce qui concerne les assignations de l'administration qui recherche l'accord.

639EO (7) Le Comité examine l'allotissement en projet du point de vue de la probabilité du brouillage nuisible
Mar2 que cet allotissement serait susceptible de subir de la part d'un allotissement figurant dans le Plan au nom de l'administration qui n'a pas répondu à la demande du Comité, on qui a communiqué son désaccord sans en fournir les raisons; si sa conclusion est favorable et si l'application de la présente procédure aux autres administrations concernées le permet, il insère l'allotissement en projet dans le Plan.

639EP Mar2 (8) Dans le cas d'une conclusion défavorable, le Comité informe l'administration concernée du résultat de son examen; si cette dernière insiste et, si l'application de la présente procédure aux autres administrations concernées le permet, il insère l'allotissement en projet dans le Plan.

639EQ Mar2 (9) Lorsque le Comité reçoit une demande aux termes de l'alinéa *c*) du numéro **639EI,** il évalue les possibilités de partage et il communique aux administrations intéressées les résultats obtenus.

639ER Mar2 (10) En cas de désaccord persistant, le Comité examine l'allotissement en projet du point de vue du brouillage nuisible qui serait causé au service assuré par les stations de l'administration ayant manifesté son désaccord. Dans le cas où la conclusion du Comité est favorable et si l'application de le présente procédure aux autres administrations concernées le permet, il insère l'allotissement en projet dans le Plan.

639ES Mar2 (11) Si, à la suite de l'examen dont il est question au numéro **639ER,** le Comité aboutit à une conclusion défavorable, il examine l'allotissement en projet du point de vue du brouillage nuisible susceptible d'être causé aux services assurés dans les différentes voies dans la bande considérée. Si le Comité formule une conclusion défavorable dans tous les cas, il choisit la voie la moins défavorablement influencée et, si l'administration qui recherche l'accord lui en fait la demande il insère l'allotissement en projet dans cette voie du Plan.

639ET Mar2 § 5. L'administration qui recherche l'accord pour un allotissement informe le Comité des résultats de ses consultations avec les administrations concernées. Lorsque le Comité conclut que la procédure décrite dans le présent article a été appliquée à l'égard de toutes les administrations concernées, il publie sa conclusion dans une section spéciale de sa circulaire hebdomadaire et, selon le cas, il met le Plan à jour.

639EU Mar2 § 6. Nonobstant les dispositions qui précédent et si les circonstances le justifient, une administration peut, dans des cas exceptionnels, notifier au Comité, en vue de son inscription provisoire dans le Fichier de référence, une assignation de fréquence non couverte par un allotissement. Elle doit cependent commencer en même temps la procédure décrite au présente article.

639EV Mar2 § 7. Lorsque, dans le délai de douze mois qui suit la date d'insertion d'un allotissement dans le Plan, le Comité ne reçoit pas la notification d'une première assignation de fréquence relative à cet allotissement ou lorsque cette première assignation notifiée n'a pas été mise en service dans les délais prescrits dans le Règlement des radiocommunications, avant de procéder à la suppression de l'allotissement dans le plan, il consulte l'administration concernée sur l'opportunité d'une telle suppression et publie cette information dans le cadre de la mise à jour du Plan. Cependant, au cas où à la suite d'une demande reçue de l'administration concernée, le Comité conclut que des circonstances exceptionnelles motivent un délai supplémentaire, ce dernier ne doit en aucun cas dépasser six mois, sauf dans le cas d'une administration qui n'a pas de station côtière en service, administration pour laquelle ce délai peut être étendu à dix-huit mois.

639EW Mar2 § 8. Toute administration au nom de laquelle un allotissement figure dans le Plan et qui a besoin, en vue d'améliorer son service, de remplacer cet allotissement par un autre dans la même bande de fréquences, applique le procédure décrite dans le présent article. Dans le cas où cette administration aboutit dans l'application de cette procédure à un résultat positif, le Comité remplace, à sa demande, l'allotissement existant dans le Plan par l'allotissement en projet.

639EX Mar2 § 9. Le Comité tient à jour un Plan de référence, tel qu'il résulte de l'application de la présente procédure. Il établit sous une forme appropriée, aux fins de publication par le Secrétaire général, tout ou partie d'une version révisée du Plan chaque fois que les circonstances le justifient, et en toute cas une fois par an.

APPENDICE 26

PARTIE I

Dispositons générales

SECTION I

Définitions

1. *Plan d'allotissement des fréquences.*

Plan qui indique les fréquences à utiliser dans une zone ou par un pays, sans préciser les stations auxquelles ces fréquences peuvent être assignées.

2. *Signification de la terminologie* employée dans le présent Appendice pour les différentes méthodes de répartition des fréquences:

Répartition des fréquences à des:	En français	En englais	En espagnol
Services	Attibution (attribuer)	Allocation (to allocate)	Atribución (atribuir)
Zones	Allotissement (allotir)	Allotment (to allot)	Adjudicación (adjudicar)
Stations	Assignation (assigner)	Assignment (to assign)	Asignación (asignar)

3. *Une ligne aérienne mondiale principale* est une ligne de grande longueur, comprenant un ou plusieurs tronçons, dont le caractère est essentiellement international, qui s'étend sur plusieurs pays et qui exige des communications à longue distance.

4. *Une zone de passage des lignes aériennes mondialles principales* (ZLAMP) est une zone englobant un certain nombre de lignes aériennes mondiales principales qui suivent généralement un même courant de trafic et qui son géographiquement assez voisines pour pouvoir être desservies logiquement à l'aide des mêmes familles de fréquences.

5. *Les lignes aériennes régionales et nationales* sont toutes les lignes aériennes utilisant le service mobile aéronautique (R) qui n'entrent pas dans la définition des lignes aériennes mondiales principales donnée au paragraphe 4 ci-dessus.

6. *Une zone des lignes aériennes régionales et nationales* (ZLARN) est une zone englobant un certain nombre de lignes aériennes au numéro précédent.

7. *Famille de fréquences du service mobile aéronautique.*

Groupe de fréquences choisies dans différentes bandes du service mobile aéronautique pour permettre l'établissement de communications entre les aéronefs en vol et les stations aéronautiques correspondantes quelles que soient les heures et les distances.

SECTION II

Principes techniques et d'exploitation appliqués pour l'établissement du plan d'allotissement des fréquences pour les services mobiles aéronautiques (R) et (OR)

A) Détermination de la largeur des voies

1. *Espacement entre fréquences.*

Les espacements entre fréquences qu'indique le tableau suivant permettent l'emploi de systèmes de communication à rendement élevé.

Bande (kHz)	Espacement entre fréquences (kHz)	Bande (kHz)	Espacement entre fréquences (kHz)
2 850-3 155	7	8 815- 9 040	8,5
3 400-3 500	7	10 005-10 100	9
3 900-3 950	7	11 175-11 400	9,5
4 650-4 750	7	13 200-13 360	10
5 450-5 480	7,5	15 010-15 100	10
5 480-5 730	7,5	17 900-18 030	10
6 525-6 765	7,5	–	–

a) On suppose que, pour les émissions de classe A3. les fréquences de modulation ont pour limite supérieure 3000 Hz et que, pour les autres classes d'émissions autorisées, le rayonnement des bandes latérales ne dépasse pas celui des émissions de classe A3.

b) Afin d'éviter les brouillages susceptibles de résulter de l'emploi simultané d'une même voie pour des émissions de classes différentes, l'utilisation pour les diverses classes d'émission (A1, A2, A3, A4 et F1) des voies telles qu'elles résultent du tableau précédent fera l'objet d'arrangements particuliers entre les administrations intéressees, aucune priorité de principe n'étant accordée à une classe d'émission particulière.

c) On reconnaît qu'il est possible de fractionner chacune des voies résultant des espacements ci-dessus en deux voies, ou davantage, convenant pour les émissions de classe A1.

d) Pour satisfaire des besoins particuliers, on pourra grouper des voies adjacentes qui résultent du tableau précédent, sous réserve que les administrations intéressées concluent des arrangements particuliers.

e) Les arrangements visés aux alinéas *b*), *c*), *d*) ci-dessus seront conclus en vertu des dispositions de l'article 43 (Arrangements particuliers) de la Convention internationale des télécommunications, et de l'article 4 du Règlement des radiocommunications.

2. *Fréquences à allotir.*

On trouvera dans le tableau ci-contre la liste des fréquences à allotir dans les bandes exclusives réservées au service mobile aéronautique, sur la base de la largeur de bande prévue au paragraphe 1 ci-dessus.

kHz

2850-3155	4650-4750	8815-9040	15 010-15 100
3 023,5 (R) et (OR) 3 032 3 039 3 046 3 053 3 060 3 067 3 074 3 081 3 088 3 095 3 102 3 109 3 116 3 123 3 130 3 137 3 144 3 151 (OR) 18 voies	4 703,5 4 710,5 4 717,5 4 724,5 4 731,5 4 738,5 4 745,5 (OR) 7 voies	8 967 8 975,5 8 984 8 992,5 9 001 9 009,5 9 018 9 026,5 9 035 (OR) 9 voies	15 016 15 026 15 036 15 046 15 056 15 066 15 076 15 086 (*a*) 15 092,5 (*a*) 15 096,5 (OR) 11 voies
3900-3950	5480-5730	11 175-11 400	17 900-18 030
Région 1 3 904 3 911 3 918 3 925 3 932 3 939 3 946 (OR) 7 voies	5 680 (R) et (OR) 5 688 5 695,5 5 703 5 710,5 5 718 5 725,5 (OR) 6 voies	11 180,5 11 190 11 199,5 11 209 11 218,5 11 228 11 237,5 11 247 11 256,5 11 266 (*a*) 11 273 (OR) 11 voies	(*a*) 17 975 17 983,5 17 993,5 18 003,5 18 013,5 18 023,5 (OR) 6 voies
	6525-6765	13 200-13 360	
	(*a*) 6 685 (*a*) 6 687,5 6 693 6 700,5 6 708 6 715,5 6 723 6 730,5 6 738 6 745,5 6 753 6 760,5 (OR) 12 voies	13 205,5 13 215,5 13 225,5 13 235,5 13 245,5 13 255,5 (OR) 6 voies	

(*a*) Cette fréquence ne doit être utilisée que pour des émissions de classe A1.

3. *Voies communes aux services (R) et (OR).*

L'usage des voies communes aux services (R) et (OR) et dont les fréquences centrales sont 3023,5 kHz et 5680 kHz est autorisé dans le monde entier comme l'indique la partie II du présent appendice.

Nonobstant les dispositions du Plan d'allotissement figurant à la parte II du présent appendice, la fréquence 5680 kHz peut également être utilisée dans les stations aéronautiques pour les communications avec des stations d'aéronef lorsque les autres fréquences des stations aéronautiques sont indisponibles ou inconnues. Cette utilisation sera cependant limitée à des zones et à des conditions telles qu'il ne puisse en résulter aucun brouillage nuisible aux autres communications autorisées du service mobile aéronautique.

4. L'Organisation de l'Aviation Civile Internationale (OACI) assure dans une grande partie du monde la coordination internationale entre les radiocommunications du service aéronautique (R). Il convient donc, le cas échenté, de consulter cette organisation en particulier pour utilisser en exploitation les fréquences prévues dans le Plan.

5. *Adaptation de la procédure d'allotissement.*

Les plans d'allotissement contenus dans cet appendice n'épuisent évidemment pas toutes les possibilités de partage. Aussi, afin de faire face à des besoins particuliers d'exploitation auxquels les présents plans d'allotissement ne satisfont pas d'une autre manière, les administrations peuvent assigner des fréquences prises dans les bandes d'ondes décamétriques du service mobile aéronautique dans des zones autres que celles auxquelles elles sont alloties dans lesdits plans. Toutefois, l'utilisation des fréquences ainsi assignées ne doit pas diminuer la protection dont bénéficient ces mêmes fréquences, dans les zones où elles sont alloties par les plans au-dessous de la valeur déterminée par l'application de la procédure prévue par la section II-B de la partie I et le paragraphe 4, *d*), de la section II de la partie III du présent appendice pour les services (R) et (OR) respectivement.

6. Lorsqu'il est nécessaire de satisfaire les exigences de l'exploitation des lignes aériennes internationales, les administrations pourront adapter les procédures d'allotissement pour l'assignation des fréquences du service mobile aéronautique (R) et ces assignations seront ensuite sujettes à l'approbation préalable des administrations intéressées.

7. On aura recours à la coordination décrite au paragraphe 4 lorsqu'il sera opportun de la faire pour l'utilisation rationelle des fréquences en question.

8. En plus des dispositions de cert appendice qui prévoient l'extension de certaines fréquences des ZLAMP EU et ME, pour répondre aux besoins des vols internationaux en provenance et à destination du territoire de l'URSS, l'administration de ce pays pourra utiliser, dans la même intention, les fréquences alloties aux ZLARN 2 et 3 à leurs subdivisions. Il ne devra pas en résulter une diminution de la protection au-dessous des normes mentionées au paragraphe 5 ci-dessus pour l'ensemble des stations du service mobile aéronautique.

B) Courbes indiquant des portées de brouillage

1. *Définition des courbes.*

Sur les calques insérés dans une pochette à la fin du présent appendice, des courbes indiquent, pour les différents ordres de grandeur de fréquences, la limite des distances minima acceptables devant séparer deux stations terrestres émettant sur la même fréquence et dont la puissance rayonnée serait de 1 kW (émission non modulée), afin d'assurer, à la limite de portée utile de l'emission désirée d'une des stations terrestres, un rapport signal utile/signal brouilleur de 15 db à bord d'une station d'aéronef.

La portée utile n'est pas inidiquée sur les courbes.

2. *Type de carte utilisé.*

Ces calques ne peuvent être utilisés que sur un planisphère établi selon une projection de Mercator et dont l'échelle est identique à celle indiquée sur chacun des calques. Ils ne doivent donc pas être utilisés sur des cartes qui ne seraient pas conformes à ces définitions. Les planisphères, que l'on trouvera également à la fin de cet appendice, sur lesquels figurent les limites des ZLAMP et celles des ZLARN, sont établis à l'échelle convenable et les calques peuvent être utilisés sur ceux-ci.

3. *Changement d'échelle ou de systeme de projection.*

Si l'on désire utiliser d'autres cartes en projection de Mercator, avec une échelle différente, il est nécessaire de dessiner, à partir des coordonnées figurant dans les tableaux ci-dessous, de nouvelles courbes pour tenir compte du changement d'échelle.

En dessinant les nouvelles courbes, il faut se rappeler que le point d'intersection de l'axe vertical de symétrie, c'est-à-dire um méridien, et de l'axe perpendiculaire représentant um parallèle, doit être à la latitude 00° pour la courbe 00°, à celle de la latitude 20° N pour la courbe 20°, 40° N pour 40°, etc.

Les coordonnées géographiques apparaissant dans les tableaux ci-dessous sont données par rapport au méridien 180° pris comme axe de symétrie pour la construction des courbes.

4. *Conditions adoptées pour le partage des fréquences entre les zones.*

Les différents calques sont établis dans les conditions de partage de fréquences adoptées par la Conférence internationale administrative des radiocommunications aéronautiques (CIARA, 1948/1949), soit:

Zones	Bandes comprises entre: (MHz)	Conditions de partage
Entre deux ZLAMP	3 et 6,6 9 et 11,3 13 et 18	Propagation de nuit. Propagation de jour. Séparation en longitude. *Note.* — Il a été admis que les conditions de partage étaient les mêmes pour 6,6 MHz et pour 5,6 MHz.
Entre une ZLAMP et une ZLARN	3 et 5,6 6,6 et 11,3 13 et 18	Propagation de nuit. Propagation de jour. Séparation en longitude.
Entre deux ZLARN	3 et 4,7 5,6 et 11,3 13 et 18	Propagation de nuit. Propagation de jour. Séparation en longitude.

Des courbes supplémmentaires permettent de déterminer les possibilités de répétition pour une utilisation diurne des fréquences comprises dans les bandes 3 MHz, 3,5 MHz et 4,7 MHz.

Les renseignements donnés dans les «Graphiques de portées minimum et maximum à utiliser comme guide pour l'allotissement des fréquences», annexe 1, volume 1 du Rapport de la première session de la CIARA (Génève, 1948), on été utilisés pour la préparation du plan d'allotissement.

5. *Mode d'emploi.*

Prendre l'une des cartes annexées au présent appendice et choisir le calque correspondant à l'ordre de grandeur de fréquences et aux conditions de partage que l'on désire étudier.

Placer de centre du calque (c'est-à-dire l'intersection de l'axe de symétrie et de l'axe horizontal), sur la ligne délimitant la zone ou sur le lieu géographique de l'émetteur. Noter la latitude de ce point et prendre la courbe correspondante.

Pour tout émetteur situé en um point quelconque à l'extérieur de la courbe, la rapport de protection défini au paragraphe 1 ci-dessus sera supérieur à 15 db.

Pour tout émetteur se trouvant en un point situé à l'intérieur de la courbe, la rapport de protection obtenu sera inférieur à 15 db.

L'orientation des courbes est telle qu'elles sont utilisables pour l'hémisphère nord; pour l'hémisphère sud, elles devront être inversées. C'est une précaution qu'il convient de prendre lorqu'il s'agit de suivre les limites des zones et de passer d'un hémisphère à l'autre.

6. *Élements pour le tracé des courbes.*

3,0 MHz, nuit

C) Puissance rayonée

Sauf indication contraire figurant aux parties II et IV, on suppose que les puissances de crêtes rayonées sont les suivantes:

Classe d'émission	Stations	Puissance de crête rayonnée
A1	Stations terrestres	1 kW
	Stations d'aéronef	50 W
A3 (taux de modulation 100 %)	Stations terrestres	4 kW
	Stations d'aéronef	200 W

PARTIE II

(Remplace par l'appendice 27.)

PARTIE III

Principes techniques et d'exploitation appliqués dans l'allotissement des fréquences pour le service mobile aéronautique (OR)

SECTION I

Bandes de fréquences et voies disponibles

1. *Bandes de frequénces.*

Les bandes de fréquences disponibles pour le service aéronautique (OR) forment trois catégories distinctes:

a) Les bandes attribuées en exclusivité au service mobile aéronatique (OR);
b) Les bandes attribuées en partage spécifiquement au service mobile aéronautique (OR) et à d'autres services;
c) Les bandes attribuées au service mobile dont le service mobile aéronautique (OR) n'est pas spécifiquement exclu.

2. *Fréquences à assigner.*

A) Bandes exclusives:

Pour les bandes attribuées en exclusivité au service mobile aéronautique (OR), les fréquences à assigner sont indiquées à la Partie I.

B) Bandes partagées:

Les voies que l'on propose d'attribuer au service mobile aéronautique (OR) dans les bandes qu'il partage avec d'autres services ont la même largeur que celles des bandes exclusives. Cependant, aucune fréquence de ces bandes n'a été spécifiquement désignée pour ces attributions. Le nombre des voies dont l'attribution est proposé dans ces bandes pour le service mobile aéronautique (OR) a été déterminé en tenant compte notamment de la largeur des bandes et du nombre des services qui les partagent.

C) Voies communes aux services (R) et (OR):

L'usage des voies communes aux services (R) et (OR) et dont les fréquences centrales sont 3023,5 kHz, et 5680 kHz est autorisé dans le monde entier dans les conditions définies au numéro **3** de la section II de la Partie I.

3. *Choix des fréquences.*

A) Bandes exclusives:

Les besoins, y compris les besoins communs à plusiurs régions, ont été satisfaits, dans la limite des bandes disponibles, à l'aide des fréquences des bandes attribuées en exclusivité dans le monde entier au service mobile aéronautique (OR). Dans la Région 1, les besoins excéndentaires ont été satisfaites dans la mesure du possible au moyen des fréquences de la bande 3900-3950 kHz attribuées en exclusivité au service mobile aéronautique (OR) dans cette Région.

B) Bandes partagées:

Le reste des besoins a été satisfait, dans la mesure la plus large possible, à l'aide des fréquences des bandes indiquées aux paragraphes 1, *b*), et 1, *c*), de la présente section est envisagées dans cet ordre.

SECTION II

Adaptation des principes techniques

1. *Fractionnement des voies.*

Pour utiliser les bandes de la façon la plus rationelle, on a consideré qu'il est possible d'aménager, dans une voie prévue pour une émission de classe A.3, ou bien une émission de classe A.3, ou bien deux ou plus de deux émissions A.1, A.3.A, ou encore d'autres types complexes de transmission. Quand une voie est subdivisé, les subdivisions ne doivent pas être utilisées par des administrations différentes. En utilisant les voies supplémentaires ainsi obtenues, on doit veiller à ne pas causer de brouillage nuisible aux usagers des voies adjacentes.

2. *Modification de la classe d'une émission.*

En raison de la nécessité, d'une part d'éviter les brouillages nuisibles, d'autre part d'utiliser de la façon la plus efficace les bandes de fréquences disponibles, la modification de la classe d'une émission est autorisée dans le cas où un tel changement n'exige aucun élargissement de la bande nécessaire.

3. *Allotissement des voies adjacentes (OR).*

On a alloti des voies adjacentes à un pays en ayant exprimé le désir, lorsque les conditions géographiques l'ont permis et chaque fois que cela s'est révélé possible.

4. *Rapports de protection et partages.*

a) Pour les zones où il s'est révélé nécessaire d'accroître le nombre de répetitions des assignations, on a satisfait à l'aide d'une voie allotie à une administration plusieurs demandes formulées par cette administration, même dans le cas où il pouvait en résulter un abaissement du rapport de protection entre les émissions des stations intéressées;

b) Dans les zones où le nombre des demandes dépasse de beaucoup la moyenne, les rapports de protection peuvent être réduits pa accords entre les administrations intéresées;

c) Certaines assignations ont été répétées bien qu'il y ait une forte probabilité de brouillages entre stations relevant d'administrations différentes; on a admis, ce faisant, que toutes les stations en question n'émettraient que par intermittence. En pareil cas, toutes les stations intéressées ont des droits égaux à l'utilisation de la fréquence commune, et aucune station ni aucun groupe de stations ne bénéficie d'aucune priorité sur les autres;

d) Certaines fréquences ont été assignés sous la forme d'assignations dites «secondaires». En pareil cas, une station qui dispose d'une fréquence sous la forme d'une assignation dite «primaire» est protégée par les dispositions suivantes contre les brouillages nuisibles qu'est susceptible de provoquer une station qui dispose de la même fréquence sous la forme d'une assignation secondaire:

La puissance émise par la station qui dispose d'une assignation secondaire doit être inférieure à celle de la station qui dispose de la même fréquence sous la forme d'une assignation primaire;

Une distance au moins égale à la moitié de la distance de répétition requise pour assurer un rapport de protection de 20 décibels doit séparer les stations intéressées.

4. *Limitation de la puissance des stations.*

Les administrations intéressées doivent s'entendre pour réduire pendant la nuit la puissance rayonnée par les stations aéronautiques afin de pouvoir utiliser ces fréquences pendant la nuit.

PARTIE IV

Plan d'allotissement des fréquences pour le service mobile aéronautique (OR) dans les bandes comprises entre 2505 kHz et 23 350 kHz

1. Les abréviations suivantes ont été employées dans le Plan:

a) *Liste alphabétique des abréviations désignant les pays:*

AFS	Union de l'Afrique du Sud.
AGL	Angola.
ALB	Albanie (République populaire d').
ALS	État de l'Alaska, États-Unis d'Amerique.
ARG	République Argentine.
ARS	Arabie Saoudite.
ATN	Antilles néerlandaises.
AUS	Australie (Fédération de l').
AUT	Autriche.
AZR	Açores.
B	Brésil.
BER	Bermudes.
BLR	République Socialiste Soviétique de Biélorussie.
BOL	Bolivie.
BUL	Bulgarie (République populaire de).
CAF	République Centrafricaine.
CAN	Canada.
CAR	Carolines.
CRG	Cambodge.
CHL	Chili.
CHN	Chine.
CLM	Colombie (République de).
CLN	Ceylan.
CME	Cameroun (État du) (sous tutelle de la France).
COG	République du Congo.
CPV	Cap Vert (Îles du).

CTI	République de Côte d'Ivoire.
CTR	Costa Rica.
CUB	Cuba.
CYP	Chypre.
D	Allemagne.
DAH	République du Dahomey.
DNK	Danemark.
DOM	République Dominicaine.
E	Espagne.
EGY	République Arabe Unie (Région égyptienne).
EQA	Equateur.
ETH	Ethiopie.
F	France et Algérie.
FJI	Fidji (Îles).
FNL	Finlande.
G	Royaume-Uni de la Grande-Bretagne et de l'Irlande du Nord.
GAB	République Gabonaise.
GDL	Guadeloupe (Département français de la).
GIB	Gibraltar.
GNP	Guinée portugaise.
GRC	Grèce.
GRL	Groenland.
GTM	Guatemala.
GUB	Guyane britannique.
GUF	Guyane (Département français de la).
HKG	Hongkong.
HND	Honduras (République de).
HOL	Pays-Bas.
HTI	Haïti (République d').
HVO	République de Haute-Volta.
HWA	État d'Hawaï, États-Unis d'Amérique.
I	Italie.
IND	Inde.
INP	Indes portugaises.
INS	Indonésie (République d').
IOB	Indes occidentales britanniques.
IRN	Iran.
IRQ	Iraq.
ISL	Islande.
ISR	État d'Israël.
J	Japon.
JON	Île Johnston.
KEN	Kenya.
LAO	Laos.
LBN	Liban.
LBY	Libye.
MAC	Macau.
MDG	Madagascar (République Malgache).
MDW	Îles Midway.
MEX	Mexique.
MLA	Malaya.
MLI	Fédération du Mali.
MLT	Malte.
MOZ	Mozambique.
MRA	Mariannes.
MRC	Maroc (Royaume du).
MRL	Marshall.
MRT	Martinique (Département français de la).
MTN	République Islamique de Mauritanie.
NCG	Nicaragua.
NCL	Nouvelle-Calédonie et dépendances.
NGN	Nouvelle Guinée néerlandaise.
NGR	République du Niger.
NHB	Nouvelles-Hébrides (Archipel) (Condominium franco-britannique).
NOR	Norvège.

NZL	Nouvelle-Zélande.
OCE	Polynésie française.
PAK	Pakistan.
PAP	Papua (Territoires des).
PHL	Philippines (République des).
PNR	(Panama (République des).
PNZ	Zone du Canal de Panana.
POL	Pologne (République Populaire de).
POR	Portugal.
PRG	Paraguay.
PRU	Pérou.
PTR	Puerto Rico.
REU	Réunion (Département français de la).
RHS	Rhodesia du Sud.
ROU	République Populaire Roumanie.
S	Suède.
SLV	El Salvador (République de).
SMB	Somalie britannique.
SMF	Côte française des Somalis.
SNG	Singapore.
STPS	Tomé et Príncipe.
SUI	Suisse.
SUR	Surinam.
SYR	République Arabe Unie (Région syrienne).
TCD	République du Tchad.
TCH	Tchéscoslovaquie.
TGO	Togo (République du).
TMP	Timor portugais.
TUN	Tunisie.
UKR	République Socialiste Soviétique de l'Ukraine.
URG	Uruguay.
URS	Union des Républiques Socialistes Soviétiques.
URS–AM	Union des Républiques Socialistes Soviétiques — Asie Centrale.
URS–C	Union des Républiques Socialistes Soviétiques — Caucase.
URS–E	Union des Républiques Socialistes Soviétiques — Europe.
URS–SEO	Union des Républiques Socialistes Soviétiques — Sibérie et Extrême-Orient.
USA	Les 48 États contigus des États-Unis d'Amérique (à l'exception des États de l'Alaska et de Hawaï).
VEN	Vénézuela.
VTN	Viêt-Nam.
WAKJ	(Wake (Île).
YUG	Yougoslavie.

b) Autres abréviations:

N = Nord;
E = Est;
S = Sud;
W = Ouest.

Exemple:

«N-46° N» *signifie* «au Nord de 46° Nord»;
«55° W-64° W et N-7° S» *signifie* «entre 55° Ouest et 64° Ouest et au Nord de 7° Sud»;
W = Watts;
kW = Kilowatts.

Exemple:

«CUB (500 W)»*signifie* «Cuba puissance limitée à 500 watts antenne»;
(6) *signifie* «Stations français»;
(7) *signifie* «Stations des États-Unis d'Amerique»;
(81) *signifie* «Allemagne de l'Est»;
■ *signifie* «Réseaux de la Communauté française».

APÊNDICE 27 Aer2

Plan d'allotissement de fréquences pour le service mobile aéronautique (R) et renseignements connexes

(Voir l'article 50 du Règlement des radiocommunications)

PARTIE I

Dispositions générales

SECTION I

Définitions

1. Plan d'allotissement de fréquences.

27/1 Plan qui indique les fréquences à utiliser dans une zone, sans préciser les auxquelles ces fréquences peuvet être assignées.

27/2 2. Signification de la terminologie employée dans le présent appendice pour les de méthodes de répartition des fréquences:

Répartition des fréquences à des	En français	En anglais	En espagnol
Services	Attribution (attribuer)	Allocation (to allocate)	Atribución (atribuir)
Zones	Allotissement (allotir)	Allotment (to allot)	Adjudicación (adjudicar)
Stations	Assignation (assigner)	Assignment (to assign)	Asignación (asignar)

27/3 3. *Une ligne aérienne mondiale principale* est une ligne de grande longueur, comprent un ou plusieurs tronçons, dont le caractère est essentiellement international, qui s'étendre plusieurs pays et qui exige des communications à longue distance.

27/4 4. *Une zone de passage des lignes aériennes mondiales principales* (ZLAMP) est un englobant un certain nombre de lignes aériennes mondiales principales qui suivent général un même courant de trafic et qui sont géographiquement assez voisines pour pouvoir être des logiquement à l'aide des mêmes familles de fréquences.

27/5 5. *Les lignes aériennes régionales et nationales* sont toutes les lignes aériennes utilisant le service mobile aéronautique (R) qui n'entrent pas dans la définition des lignes aériennes mondiales principales donnée au numéro **27/3.**

27/6 6. *Une zone des lignes aériennes régionales et nationales* (ZLARN) est une zone englobant un certain nombre de lignes aériennes définies au numéro **27/5.**

27/7 7. *Une zone d'allotissement VOLMET* est une zone dont les limites englobent tous les points où une installation destinée à des diffusion sur ondes décamétriques peut être appelée à émettre à l'aide d'une famillie de fréquences allotie à la zone en question.

27/8 8. *Une zone de réception VOLMET* est une zone à l'intérieur de laquelle les aéronefs doivent pouvoir recevoir les émissions d'une ou plusieurs stations situées dans la zone d'allotissement VOLMET à laquelle elle est associée.

27/8A 8-A. *Une zone mondiale d'allotissement* est une zone à laquelle sont alloties des fréquences permettant l'établissement de communications à grande distance entre une station aéronautique située dans cette zone et un aéronef en service n'importe où dans le monde (1).

27/8A.1 (1) Le type de communications auxquelles se référe le numéro **27/8A** peut faire l'objet d'une réglementation par les administrations.

27/9 9. *Une fanilie de fréquences du service mobile aéronautique (R)* se compose de deux fréquences ou plus choisies dans différentes bandes du service mobile aéronautique (R) et destinées à l'établissement des communications dans la zone d'utilisation (voir les numéros **27/189** à **27/207A**, quelles que soient les heures, entre les stations d'aéronef et les stations aéronautiques correspondantes.

SECTION II

Principes techniques et d'exploitation appliqués pour l'établissement du Plan d'allotissement de fréquences pour le service mobile aéronautique (R)

A) Caractéristiques et utilisation des voies

1. *Espacements entre fréquences.*

27/10 1.1. L'espacement entre fréquences porteuses (fréquences de référence) est de 3 kHz. Cet espacement est suffisant pour des systèmes de communication utilisant les classes d'émission mentionnées aux numéros **27/49** à **27/52** dans les bandes de fréquences comprises entre 2850 kHz et 22 000 kHz attribuées en exclusivité au service mobile aéronautique (R). La fréquence porteuse (fréquence de référence) des voies figurant dans les Plan doit être un multiple entier de 1 kHz.

27/11 1.2. Pour les émissions radiotélephoniques, les fréquences audibles ont pour limites 300 et 2700 Hz; pour les autres classes d'émission autorisées, la largeur de bande occupée ne dépasse pas la limite supérieure des émissions de classe A3J. Toutefois, la spécification de ces limites n'implique aucune restriction quant à leur extension en ce qui concerne les émissions autres que celles de la classe A3J, á condition que les limites relatives aux émissions non désirées soient respectées (voir les numéros **27/66B** et **27/66C**).

27/11A *Note — Pour les types d'émetteur de station d'aéronef et de station aéronautique installés pour la première fois avant le 1er février 1983, les fréquences audibles sont limitées à 3000 Hz.*

27/11B 1.3. En raison des brouillages possibles, une voie donnée ne devraient pas être utilisée dans la même zone d'allotissement pour la radiotéléphonie et la transmission de données.

27/12 1.4. Afin d'éviter les brouillages nuisibles susceptibles de résulter de l'emploi simultané d'une même voie pour des émissions de classes différents, l'utilisation, pour les diverses classes d'émission autres que A3J et A2H, des voies dérivées des fréquences indiquées au numéro **27/16** doit faire l'objet d'arrangements particuliers entre les administrations intéressées et celles dont les services susceptibles d'être défavorablement influencés.

27/13 SUP

27/14 1.5. Pour éviter des brouillages possibles, les voies adjacentes dérivées des fréquences indiquées dans le tableau (numéro **27/16**) n'ont pas, en règle générale, été alloties aux mêmes ZLAMP, ZLARN ou zones VOLMET. Toutefois, pour satisfaire à des besoins particuliers, les administrations intéressées peuvent conclure des arrangements particuliers pour des assignations de voies adjacentes dérivées des fréquences indiquées dans ledit tableau.

27/15 1.6. Les arrangements visés aux numéros **27/12** et **27/14** sont conclus em vertu des dispositions des articles de la Convention internationale des télécommunications et du Règlement des radiocommunications intitulés «Arrangements particuliers» (1).

2. *Fréquences alloties.*

27/16 On trouvera dans le tableau ci-après la liste des fréquences porteuses (fréquences de référence) alloites dans les bandes attribuées en exclusivité au service mobile aéronautique (R), sur la base des espacements entre fréquences spécifiés au numéro **27/10** (2).

---

(1) Note de secrétariat général: L'article pertinent du Règlement des radiocommunications est maintenant l'article 7, intitulé «Accords particuliers».

27/16.1 (2) Pour le calcul de la fréquence assignée par rapport à une fréquence porteuse (fréquence de référence) figurant dans le tableau, voir les numéros **27/12**, **27/72B** et **27/73**.

27/17 à 27/19 SUP

27/20 4. L'Organisation de l'aviation civile internationale (OACI) assure la coordination internationale des radiocommunications du service mobile aéronautique (R). Cette Organisation devrait être consultée, dans tous les cas appropriées, pour utiliser, en exploitation, les fréquences prévues dans le Plan.

5. *Adaptation de la procédure d'allotissement.*

27/21 Le plan d'allotissement contenu dans de présent appendice n'épuise évidemment pas toutes les possibilités de partage. Aussi, afin de faire face à des besoins particuliers d'exploitation auxquels ce Plan ne satisfait pas d'une autre maniére, les administration peuvent assigner des fréquences des bandes du service mobile aéronautique (R) dans des zones aurtres que celles auxquelles elle sont alloties dans le Plan. Toutefois, l'utilisation des fréquences ainsi assignées ne doir pas diminuer au-dessous de la valeur déterminées en appliquent la procédure prévue pour le service (R) à la section IIB de la partie I du présent appendice, la protection dont elles bénéficient dans les zones où elles sont alloties dans le Plan.

27/22 6. Lorsqu'il est nécessaire de satisfaire les besoins de l'exploitation des lignes aériennes internationales, les administrations peuvent adapter la procédure d'allotissement pour assigner des fréquences du service mobile aéronautique (R); ces assignations font l'objet d'un accord préalable de la part des administrations dont les services peuvent être défavorablement influencés.

27/23 7. On a recours à la coordination décrite au numéro **27/20** lorsqu'il est opportun et souhaitable de le faire pour utiliser rationnellement les fréquences en question, et notamment dans les cas où les procédures spécifiées au numéro **27/22** ne sont pas satisfaisantes.

B) Courbes indiquant les portées de brouillage

27/24 1. *Dispositions générales.*

27/24A 1.1. *Portée utile.*

En raison de certains facteurs (puissance de l'émetteur, affaiblissement de propagation, niveau de bruit, etc.), il existe une limite en ce qui concerne les distances auxquelles on peut établir des communications fiables entre une station aéronautique et une station d'aéronef. Cette distance limite, fondée sur le trajet de propagation le plus défavorable, est appelée «portée utile». On admet souvent que la distance limite est la limite de la zone des lignes aériennes.

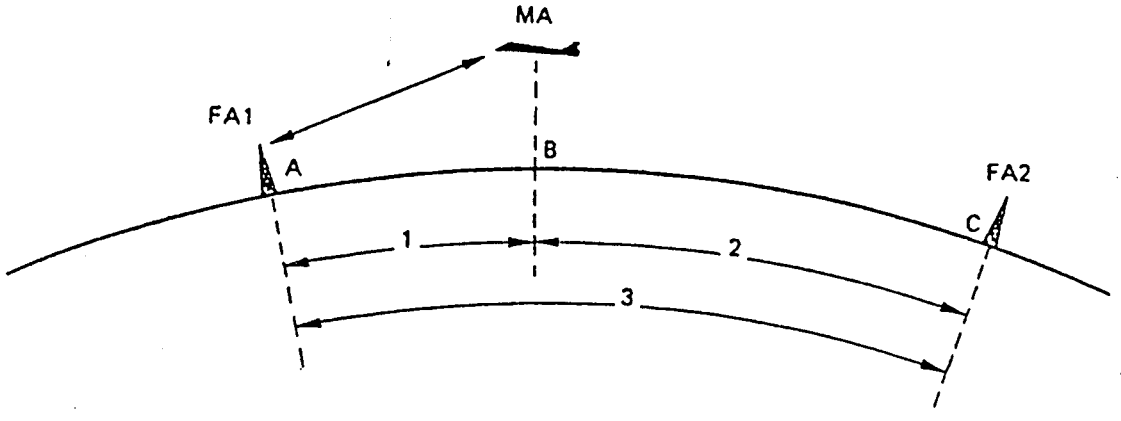
27/24B 1.2. *Portée de brouillage.*

Il s'agit de la distance minimale entre la limite de portée utile de l'émission désirée et la station susceptible de causer des brouillages, qui assure un rapport signal utile/signal brouilleur de 15 dB. Ce rapport de protection est établi entre le signal désiré reçu par une station d'aéronef à la limite de la portée utile et le signal provenant d'une station aéronautique que, émettant sur la même fréquence, est susceptible de causer des brouillages. La portée de brouillage a été calculée pour différentes fréquences indiquées dans les tableaux figurant aux numéros **27/39** à **27/48**, dans des conditions de propagation diurne et nocturne, à des latitudes moyennes, pour une activité solaire moyenne et pour une puissance apparente rayonnée moyenne de 1 kW pour la station aéronautique.

27/24C 1.3. *Distance de répétition.*

Il s'agit de la distance à laquelle on peut partager une fréquence; cette distance équivaut à la somme de la portée utile et de la portée de brouillage.

27/24D 1.4. La figure 1 illustre l'utilisation du concept de la portée de brouilalge lors de la planification des fréquences basée sur lar détermination de la distance de répétition.



FA1 = station aéronautique en communication avec la station d'aéronef MA.
FA2 = station aéronautique en communication avec des stations d'aéronef autres que la station MA.
MA = station d'áeronef en communication avec la station aéronautique FA1.
1 = portée utile AB.
2 = portée de brouillage CB.
3 = distance de répétition AC.

Figure 1 — Portée utile, portée de brouillage, distance de répétition

27/24E 1.5. Les calques utilisés dans le présent appendice indiquent, pour les fréquences mentionnées, la portée de brouillage, définie au numéro **27/24B**, entre une station aéronautique qui cause du brouillage et une station d'aéronef fonctionnant à la limite de sa portée utile. En raison de la variation des conditions de propagation non seulement d'heure en heure pendant les périodes de jour et de nuit, mais également de jour en jour, selon la saison, le niveau d'activité solaire, et le lieu géographique, on peut s'attendre à une variation notable du rapport de protection de 15 dB; par conséquent, une plus grande protection peut être assurée la plupart du temps, spécialement lorsque l'aéronef ne fontionne pas à la limite pas de sa portée utile.

27/24F 1.6. On trouve dans la documentation technique publiée par l'IFRB (par exemple, dans les textes du cycle d'études de l'IFRB sur la gestion des fréquences et l'utilisation du sprectre des fréquences: Document N° 11/76 ou révisions) des renseignements supplémentaires sur la portée utile, la portée de brouillage, la distance de répétition ainsi que sur l'utilisation des calques.

27/25 1.7. Il existe deux types de calques á utiliser respectivement avec les planisphères e projection de Mercator et avec les cartes en projection azimutale à surfaces égales le Lambert pour les zones polaires. Les calques pour cartes en projection de Mercator s'étendent sur les régions comprises entre 60° de latitude nord et 60° de latitude sud. Les calques pour cartes en projection de Lambert s'étendent sur les régions situées au nord de 30° N et au sud de 30° S. Les cartes en projection de Lambert recouvrent les cartes en projection de Mercator entre les parallèles 30° N et 60° N et les parallèles 30° S et 60° S. Ces recouvrements servent à assurer la continuité entre les calques des deux systèmes.

2. *Types de cartes utilisées.*

27/26 Les calques mentionnés aux numéros **27/24E** et **27/25** ne peuvent être utilisés que sur un planisphère ou une carte polaire dont la projection et l'échelle sont identiques à celles indiquées sur chacun des calques. Ils ne doivent donc pas être utilisés sur des cartes qui ne seraient pas conformes à ces définitions. Les planisphères et les cartes polaires à utiliser avec le présente appendice sur lesquels figurent les limites des ZLAMP, celles des ZLARN et celles des zones VOLMET, sont établis à l'échelle qui permet d'utiliser les calques directement. Les zones d'aurore sont représentéss sir les cartes polaires.

3. *Changement d'échelle ou de système de projection.*

27/27 3.1. Si l'on désire utiliser d'autres cartes avec une échelle ou une projection différente, il est nécessaire de dessiner, à partir des coordonnées qui figurent dans les tableaux ci-après, de nouvelles courbes pour tenir compte du changement d'échelle ou de projection.

27/28 3.2. En desinnant les nouvelles courbes, le point d'intersection de l'axe vertical des symètrie, c'est-à-dire un méridien, et de l'axe perpendiculaire représentant un parallèle, doit être à la laitude 00° pour la courbe 00°, 20° N pour la courbe 20°, 40° N, pourla courbe 40°, etc.

27/29 3.3. Les coordonnées géographiques qui apparaissent dans les tableaux qui figurent aux numéros **27/39** à **27/48** sont données par rapport au méridien 180° pris comme axe de symétrie pour la construction des courbes.

4. *Conditions de partage entre les zones.*

4.1. *Bandes comprises entre 3 MHz et 11,3 Mhz..*

27/30 4.1.1. Les calques sont établis dans les conditions de partage suivantes:

Zones	Bandes comprises entre (MHz)	Conditions de partage
Entre deux ZLAMP ou deux zones VOLMET ou entre une ZLAMP et une zone VOLMET.	3 et 6,6 9 et 11,3	Propagation nocturne. Propagation diurne. *Note.* — Il est adminis que les conditions de partage sont les mêmes pour 6,6 MHz et pour 5,6 MHz.
Entre une ZLAMP ou une zone VOLMET et une ZLARN.	3 e 5,6 6,6 e 11,3	Propagation nocturne. Propagation diurne.
Entre deux ZLARN	3 e 4,7 5,6 e 11,3	Propagation nocturne. Propagation diurne.

27/31 4.1.2. Des courbes supplémentaires permettent de déterminer les possibilités de répétition des fréquences des bandes des 3 MHz, 3,5 MHz et 4,7 MHz, lorsqu'elles sont utilisées de jour.

4.2. *Bandes comprises entre 13 MHz et 22 MHz.*

27/31A 4.2.1. Le Plan d'allotissement révisé pour les bandes des 13 MHz, 18 MHz et 22 MHz est uniquement fondé sur la protection pendant le jour. Il en résulte les possibilités de partage suivantes:

27/31B 4.2.2. Le facteur de répétition est au moins égal à 3, pour la bande des 13 MHz et égal à 4 pour les bandes des 18 MHz et 22 MHz. Il est à noter que l'on pourrait réduire la séparation en longitude, pour permettre une répétition de 4 (à 13 MHz) et de 6 (à 18 MHz et 22 MHz) compte tenu des conditions d'exploitation et des circonstances locales;

27/31C 4.2.3. Le partage se fait en fonction des emplacements probables des stations aéronautiques et non en fonction des limites de zones.

5. Mode d'emploi des calques pour les bandes comprises entre 3 MHz et 11,3 MHz.

27/32 5.1. Prendre l'une des cartes des ZLAMP, des ZLARN ou des zones VOLMET à utiliser avec le présent appendice et choisir le calque correspondant à l'ordre de grandeur de la fréquence et aux conditions de partage que l'on désire étudier.

27/33 5.2. Les cartes et calques en projection de Lambert sont à utiliser pour les zones polaires situées au nord de 60° N et au sud de 60° S; les cartes et calques en projection de Mercator sont à utiliser entre 60° N et 60° S.

27/34 5.3. Placer le centre du calque (c'est-à-dire l'intersection de l'axe de symétrie et de l'axe horizontal) sur la ligne qui délimite la zone (utiliser la ligne qui délimite la zone de réception dans le cas VOLMET), au point de cette ligne qui est le plus rapproché de l'émetteur susceptible de causer des brouillages, ou sur l'emplacement de l'émetteur susceptible de causer des brouillages. Noter la latitude du point choisi et utiliser la courbe de portée de brouillage correspondant à cette latitude.

27/35 5.4. Pour tout émetteur situé en un point quelconque à l'extérieur de la courbe, le rapport de protection défini au numéro **27/24B** sera supérieur à 15 dB.

27/36 5.5. Pour tout émetteur situé en un point à l'intérieur de la courbe, le rapport de protection obtenu sera inférieur à 15 dB. Cependent, si l'émetteur est situé à l'intérieur de la courbe et si le trajet de propagation traverse une zone d'aurore, il est admis que l'affaiblessiment du signal á l'intérieur de cette zone conduit à un rapport de protection supérieur à 15 dB.

27/37 5.6. L'orientation des calques en projection de Mercator est telle qu'ils sont utilisables pour l'hémisphere nord; pour l'hémisphère sud, ils doivent être renversés. C'est une précaution qu'il convient de prendre lorsqu'il s'agit de suivre les limites de zones qui passent d'un hémisphere à l'autre.

C) Classes d'émission et puissance

1. *Classes d'émission.*

27/49 Dans le service mobile aéronautique (R), il est permis d'utiliser les émissions suivantes, à condition de respecter les dispositions spéciales applicables à chaque cas et à condition de ne pas causer de brouillages nuisibles aux autres utilisateurs de la voie concernée.

27/50 1.1 *Téléphonie — modulation d'amplitude:*

Double bande latérale ..... (1) A3
Bande latérale unique, onde porteuse complète ..... (1) A3H
Bande latérale unique, onde porteuse supprimée A3J

1.2. *Télégraphie (y compris transmissions automatiques de données).*

27/51 1.2.1. *Modulation d'amplitude:*

Télégraphie sans modulation par une fréquence audible (manipulation par tout ou rien) (2) A1
Télégraphie par manipulation par tout ou rien d'une ou plusieurs fréquences audibles de modulation ou manipulation par tout ou rien de l'émission modulée, y compris l'appel sélectif, bande latérale unique, porteuse complète A2H
Télégraphie harmonique multivoie, bande latérale unique, onde porteuse supprimée A7J
Autres émissions telles que la transmission automatique de données, bande latérale unique, porteuse supprimée A9J

27/52 1.2.2. *Modulation de fréquence:*

Télégraphie par manipulation par déplacement de fréquence sans modulation par une fréquence audible, l'une des deux fréquences étant émise à un instant donné .... (2) F1

27/53 SUP

2. *Puissance.*

27/54 2.1. Sauf indication contraire figurant à la partie II du présente appendice, les puissances de crête fournies à la ligne d'alimentation de l'antenne ne dépassent pas les valeurs maximales indiquées dans le tableau ci-dessous; il est admis que les puissances apparentes rayonnées de crête correspondantes sont égales aux deux tiers de ces valeurs.

Classe d'émission	Stations	Puissance de crête maximale
A2H, A3J, A7J, A9J	Stations aéronautiques	6 kW
A3 (*a*), A3H (*a*)	Stations d'aéronef	400 W
(Taux de modulation 100 %)		
Autres émissions telles que A1, F1	Stations aéronautiques	1,5 kW
	Stations d'aéronef	100 W

(*a*) Les émissions des classes A3 et A3H doivent être utilisées seulement sur 3023 kHz et 5680 kHz, ainsi que dans les cas prévus au paragraphe 5 de la Résolution N° Aer 2-3

27/55 2.2. Il est admis que la puissance de crête maximale spécifiée dans le tableau ci-dessus pour les stations aéronautiques produira la puissance apparente rayonnée moyenne de 1 kW adoptée pour le tracé des courbes qui indiquent les portées de brouillage.

27/56 2.3. Afin d'assurer des communications de qualité satisfaisante avec les aéronefs, les stations aéronautiques qui desservente les ZLAMP, les zones VOLMET et les zones mondiales d'allotissement peuvent utiliser des puissances plus élevées que les puissances maximales spécifiées au numéro **27/54**, sauf dans le cas des fréquences 3023 kHz et 5680 kHz, que sont soumises aux dispositions spéciales des numéros

(1) Les émissions A3 et A3H sont à utiliser uniquement sur 3023 kHz et 5680 kHz ainsi que dans les cas prévus au paragraphe 5 de la Résolution N° Aer2-3.

(2) Les classes d'émission A1 et F1 sont permises à condition qu'elles ne causent pas de brouillages nuisibles aux émissions des classes A2H, A3J, A7J et A9J. Par ailleurs, les émissions des classes A1 et F1 doivent être conformes aux dispositions des numéros **27/65** à **27/66C** et il faut prendre soin de placer ces émissions au centre ou au voisinage du centre de la voie. Toutefois, une fréquence audible modulante est permise avec des émetteurs à bande latérale unique si la porteuse est supprimée conformément aux dispositions du numéro **27/63**.

27/208 à **27/214**. S'il en est ainsi, l'administration qui exerce sa juridiction sur la station aéronautique intéressée prend note des dispositions du número **694** du Réglement des radiocommunications et fait en sorte dans chaque cas:

27/57 *a*) Lorsque des brouillages nuisibles sont possibles, qu'une coordination soit effectuée avec les administrations intéressées;

27/58 *b*) Qu'aucun brouillage nuisible ne soit causé aux stations qui utilisent des fréquences conformément aux dispositons pertinentes du plan d'allotissement;

27/59 *c*) Que, dans les autres ZLAMP, ZLARN ou zones VOLMET auxquelles la ou les mêmes fréquences sont alloties, les rapports de protection spécifiés pour ces zones soient maintenus;

27/60 *d*) Que les caractéristiques de directivité de l'antenne soint telles queile rayonnement soit réduit au minimum dans les directions ou il n'est pas nécessaire et notamment vers celles des autres ZLAMP, ZLARN ou zones VOLMET auxquelles la ou les mêmes fréquences sont alloties;

27/61 *e*) Que, conformément aux dispositons du Règlement des radiocommunications, les détails complets concernant chaque assignation soient notifiés à l'IFRB y compris les caractéristiques de l'antenne d'émission.

27/62 2.4. Il est admis que la puissance des émetteurs d'aéronef peut, en pratique, dépasser les limites spécifiées au número **27/54,** mais l'utilisation d'une puissance plus élevée (qui normalement ne devrait pas dépasser une valeur de crête de 600 W) ne doit pas causer de brouillage nuisible aux stations qui utilisent des fréquences conformément aux principes techniques sur lesquels le Plan d'allotissement est fondé.

D) Limites des niveaux de puissance des émissions non désirées

1. *Dispositions d'ordre technique relatives à l'utilisation d'émissions à bande latérale unique.*

27/63 1.1. *Définition du niveau de l'onde porteuse:*

Onde porteuse	Niveau N (dB) de l'onde porteuse par tapport à la puissance de crête
Onde porteuse complète (par exemple A2H) ...	$0 \geq N \geq -6$
Onde porteuse supprimée (par exemple A3J) ..	Stations d'aéronef $N \leq -26$ Stations aéronautiques $N \leq -40$

27/64 SUP

2. *Tolérance applicable aux niveaux des émissions en dehors de la largeur de bande nécessaire.*

27/65 2.1. Dans le cas d'une émission à bande latérale unique, la puissance moyenne fournie sur une fréquence quelconque à la ligne d'alimentation de l'antenne d'une station aéronautique ou d'une station d'aéronef est inférieure à la puissance moyenne (P_m) de l'émetteur, de la quantité indiquée dans le tableau figurant au numéro **27/66.**

27/66 2.2. Por les types d'emetteur de station d'aéronef et pour les émetteurs de station aéronautique installés avant le 1er février 1983:

Ecart Δ par rapport à la fréquence assignée (kHz)	Affaiblissement minimum par rapport à la puissance moyenne (P_m) (dB)
$2 \leq \Delta < 6$	25
$6 \leq \Delta < 10$	35
$10 \leq \Delta$	Stations d'aéronef: 40 Stations aéronautiques: $43 + 10 \log_{10} (P_m)$ (watts)

27/66A *Note.* — Tous les émetteurs mis en service pour la première fois après le 1er février 1983 devront être conformes aux spécifications du numéro **27/66C.**

27/66B 2.3. Dans le cas d'une émission à bande latérale unique, la puissance de crête (P_p) fournie sur une fréquence quelconque à la ligne d'alimentation de l'antenne d'une station aéronautique ou d'une station d'aéronef est inférieure à la puissance de crête (P_p) de l'émetteur, de la quantité indiquée dans le tableau figurant au numéro **27/66C.**

27/66C 2.4. Pour les émetteurs de station d'aéronef installés aprés le 1er février 1983 et pour les émetteurs de station aéronautique utilisés après le 1er février 1983:

Ecart Δ par rapport à la fréquence assignée (kHz)	Affaiblissement minimum par rapport à la puissance moyenne (P_m) (dB)
$1,5 \leq \Delta < 4,5$	30
$4,5 \leq \Delta < 7,5$	38
$7,5 \leq \Delta$	Stations d'aéronef: 43 Stations aéronautiques: (*a*)

(*a*) Pour les puissances d'émission inférieures ou égales à 50 watts: $43 + 10 \log_{10} (P_p)$ (watts). Pour les puissances d'émission supérieures à 50 watts, l'affaiblissement doit être d'au moins 60 dB.

27/67 à 27/71 SUP

E) Autres dispositions d'ordre technique

1. *Fréquences assignées.*

27/72 1.1. Pour une station qui fait des émissions à bande latérale unique, à l'exception de la classe d'émission A2H, la fréquence assignée doit être supérieure de 1400 Hz à la fréquence porteuse (fréquence de référence).

27/72A 1.2. Pour les stations aéronautiques équipées de systémes d'appel sélectif, la classe d'émission A2H doit être indiquée dans la colonne «Renseignements supplémantaires» de la fiche de notification (voir l'appendice 1 au Règlement des radiocommunications).

27/72B 1.3. Pour les classes d'émission A1 et F1, la fréquence assignée est choisie conformément aux dispositions du renvoi relatif aux numéros **27/51** et **27/52.**

27/73 1.4. La fréquence assignée à une station qui utilise des émissions à double bande latérale (A3) doit être la fréquence porteuse (fréquence de référence).

PARTIE II

Plan d'allotissement de fréquences pour le service mobile aéronautique (R) dans ses bandes exclusives entre 1850 KHz et 22 000 kHz

SECTION I

Description des limites des zones et subdivisions de zones

27/74 1. Les descriptions des limites données ci-après concernent les zones auxquelles des fréquences ont été alloties conformément au Plan d'allotissement des fréquences établi par la Conférence.

27/75 2. Ces zones sont également représentées graphiquement sur les cartes à utiliser avec le présent appendice. S'il existe des différences entre une zone telle qu'elle est représentée sur les cartes et telle qu'elle est décrite ci-après, c'est la description qui fait foi.

27/76 3. La mention du nom d'un pays ou d'une zone géographique dans les descriptions ou sur les cartes, ainsi que le tracé de frontières sur les cartes n'impliquent, de la part de l'UIT, aucune prise de position quant au statut politique de ce pays ou de cette zone géographique, ni aucune reconnaissance officielle de ces frontières.

27/77 4. Dans la description des limites des zones de passage des lignes aériennes mondiales principales (ZLAMP), toute ligne qui joint deux points et qui n'est pas autrement définie est un arc de grand cercle.

27/78 Dans la discription des limites des zones des lignes aériennes régiolanes et nationales (ZLARN) et des subdivisions de ces zones, toute ligne qui joint deux points et qui n'est pas autrement définie est une droite sur une carte en projection de Mercator.

27/79 Dans la description des limites des zones VOLMET, toute ligne qui joint deux points est un arc de grand cercle.

ARTICLE 1

Description des limites des zones de passage des lignes aériennes mondiales principales (ZLAMP)

27/80 *Zone de passage des lignes aériennes mondiales principales — CARAIBES:*

(ZLAMP-CAR)

Du point 20° N, 120° W, par les points 35° N, 120° W, 35° N, 85° W, 43° N, 74° W, 40° N, 60° W, 00° 48° W, 00° 80° W, jusqu'au point 20° N, 120° W.

27/81 SUP

27/82 *Zone de passage des lignes aériennes mondiales principales — CENTRE EST PACIFIQUE:*

(ZLAMP-CEP)

Du point 50° N 122° W, par les points 38° N 120° W, 15° N 110° W, 20° S 145° W, 20° S 152° W, 30° N 165° W, jusqu'au point 50° N 122° W.

27/83 *Zone de passage des lignes aériennes mondiales principales — CENTRE OUEST PACIFIQUE:*

(ZLAMP-CWP)

Du point 40° N 117° E, par les points 25° N 155° W, 17° N 155° W, 00° 165° W, 00° 170° E, 12° S 136° E, 09° N 115° E, 23° N 114° E, jusqu'au point 40° N 117° E.

27/84 *Zone de passage des lignes aériennes mondiales principales — EUROPE:*

(ZLAMP-EUR)

Du point 33° N 12° W, par les points 54° N 12° W, 70° N 00°, 74° N 40 E, 74° N 52° E, 60° N 52° E, 40° N 36° E, 29° N 35° 30′ E, 32° N 13° E, jusqu'au point 33° N 12° W.

27/85 SUP

27/85A *Zone de passage des lignes aériennes mondiales principales — OCÉAN INDIEN:*

(ZLAMP-INO)

Du Pôle Sud, par les points 30° S 26° E, 20° N 35° E, 30° N 60° E, 30° N 90° E, 30° S 120° E, 40° S 160° E, jusqu'au Pôle Sud.

27/86 *Zone de passage des lignes aériennes mondiales principales — MOYEN ORIENT:*

(ZLAMP-MID)

Du point 51° N 30° E, par les points 57° N 37° E, 50° N 80° E, 44° N 94° E, 08° N 76° E, 11° 45′N 42° E, 30° N 30° E, jusqu'au point 51° N 30° E.

27/87 *Zone de passage des lignes aériennes mondiales principales — NORD ATLANTIQUE:*

(ZLAMP-NAT)

Du Pôle Nord, par les points 60° N 135° W, 49° N 120° W, 49° N 74° W, 39° N 78° W, 18° N 66° W, 05° N 55° W, 16° N 26° W, 32° N 08° W, 44° N 02° E, 60° N 20° E, jusqu'au Pôle Nord.

27/87A *Zone de passage des lignes aériennes mondiales principales — NORD CENTRE ASIE:*

(ZLAMP-NCA)

Du Pôle Nord, par les points 75° N 10° E, 60° N 25° E, 30° N 25° E, 30° N 73° E, 37° N 73° E, 49° N 85° E, 42° N 97° E, 42° N 110° E, 45° N 113° E, 46° 30′N 120° E, 49° N 116° E, 54° N 123° E, 45° N 133° E, 40° N 124° E, 30° N 124° E, 25° N 135° E, 65° N 170° W, jusqu'au Pôle Nord.

27/88 à 27/93 SUP

27/94 *Zone de passage des lignes aériennes mondiales principales — NORD PACIFIQUE.*

(ZLAMP-NP)

Du Pôle Nord, par les points 60° N 135° W, 47° N 118° W, 30° N 165° W, 30° N 115° E, 41° N 116° E, 55° N 135° E, jusqu'au Pôle Nord.

27/95 *Zone de passage des lignes aériennes mondiales principales — AFRIQUE:*

(ZLAMP-AFI)

Du point 40° N 35° W, par les points 37° N 03° W, 37° N 44° E, la frontière entre la République d'Iraq et l'Iran, les points 29° N 48° E, 26° N 56° E, 20° N 62° E, 22° S 60° E, 35° S 30° E, 35° S 16° E, 05° N 03° W, 05° N 35° W, jusqu'au point 40° N 35° W.

27/96 SUP

27/97 SUP

27/98 *Zone de passage des lignes aériennes mondiales principales — SUD ATLANTIQUE:*

(ZLAMP-SAT)

Du Pôle Sud, par les points 30° S 75° W, 19° S 53° W, 00° 60° W, 20° N 60° W, 25° N 25° W, 41° N 15° W, 41° N 03° W, 15° N 03° W, 20° S 32° E, jusqu'au Pôle Sud.

27/99 SUP

27/100 *Zone de passage des lignes aériennes mondiales principales — SUD AMÉRIQUE:*

(ZLAMP-SAM)

Du Pôle Sud, par les points 15° N 125° W, 15° N 60° W, 10° N 60° W, 05° S 30° W, 36° S 52° W, jusqu'au Pôle Sud.

27/101 SUP

27/100 *Zone de passage des lignes aériennes mondiales principales — SUB-EST ASIATIQUE:*

(ZLAMP-SEA)

Du point 26° N 130° E, par les points 00° 130° E, 00° 135° E, 12° S 145° E, 12° S 160° E, 25° S 155° E, 40° S 150° E, 35° S 115° E, 18° N 62° E, 26° N 65° E, jusqu'au point 26° N 130° E.

27/103 *Zone de passage des lignes aériennes mondiales principales — SUD PACIFIQUE:*

(ZLAMP-SP)

Du Pôle Sud, par les points 38° S 145° E, 00° 167° E, 00° 175° W, 22° N 158° W, 22° N 156° W, 00° 120° W, jusqu'au Pôle Sud.

27/103A *Zone de passage des lignes aériennes mondiales principales — ASIE DE L'EST:*

(ZLAMP-EA)

Du point 55° N 124° E, par les points 37° N 145° E, 26° N 130° E, 00° 130° E, 00° 80° E, 18° N 62° E, 37° N 67° E, 55° N 80° E, jusqu'au point 55° N 124° E.

ARTICLE 2

Description des limites des zones et subdivisions de zones des lignes aériennes régionales et nationales (ZLARN)

27/104 *Zone des lignes aériennes régionales et nationales — 1:*

(ZLARN-1)

Cette zone est délimitée par une ligne qui, partant du Pôle Nord, suit le méridien 15° W, passe par les points 72° N 15° W, 40° N 50° W, 30° N 39° W, 30° N 10° W, 31° N 10° W et 31° N 10° E; elle a ensuite le tracé suivant: frontière Libye-Tunisie jusqu'à la Méditerranée, côtes de la Libye et de la République Arabe d'Egypte jusqu'à Alexandrie; elle se dirige ensuite vers le Caire et, de là, vers l'est, le long du paralléle du Caire, jusqu'à l'intersection avec le méridien 40° E, puis vers le nord le long de ce méridien jusqu'à la rive du sud de la mer Noire, et le long de le côte turque vers l'ouest jusqu'à l'intersection avec le méridien 30° E; elle suit ce méridien jusqu'à la frontière Roumanie-URSS, puis les frontières de l'URSS avec la Roumanie, la Hongrie, la République Socialiste Tchécoslovaque, la Pologne, la côte soviétique de la Baltique jusqu'à la frontière entre la Finlande et l'URSS et entre la Norvège et l'URSS. De là, elle passe par le point 70° N 32° E et suit le méridien 32° E jusqu'au Pôle Nord.

27/105 *Subdivision de zone 1A:*

Cette subdivision est délimitée par une ligne qui, partant du point 65° N 26° W, passe par les points 40° N 50° W, 40° N 20° W, 60° N 20° W, 60° N 26° W, pour revenir à son point de départ 65° N 26° W.

27/106 *Subdivision de zone 1B:*

Cette subdivision est délimitée par une ligne qui, partant du Pôle Nord et suivant le méridien 15° W, passe par les points 72° N 15° W, 65° N 26° W, 60° N 26° W, 60° N 20° W, 50° N 20° W et 50° N 10° W, puis se dirige vers l'est en passant par les eaux territoriales entre les îles Anglo-Normandes et la côte française qu'elle rejoint au méridien 03° W, pour longer la côte dans la direction nord-est, puis la frontière de la France avec la Belgique, le Luxembourg et la République fédérale d'Allemagne, puis la frontière Suisse-République fédérale d'Allemagne et République fédérale d'Allemagne-Austrich. Elle longe ensuite la frontière entre la République Socialiste Tchécoslovaque et la République fédérale d'Allemagne, puis la frontière entre la République fédérale d'Allemagne et la République Démocratique Allemande, en direction de la mer Baltique, puis se dirige vers l'ouest en longeant la côte de la République fédérale d'Allemagne jusqu'à la frontière entre la République fédérale d'Allemagne et le Danemark. Elle longe ensuite cette frontière jusqu'à la mer du Nord et de là, le long du parallèle 55° N, gagne le point 55° N 04° E et passe ensuite par les points 56° N 03° E, 59° N 02° E et 62° N 01° E, pour rejoindre le Pôle Nord en longeant le méridien 01° E.

27/107 *Subdivision de zone 1C:*

Cette subdivision est délimitée par une ligne qui, partant du Pôle Nord, longe le méridien 01° E jusqu'au point 62° N 01° E et passe ensuite par les points 59° N 02° E, 56° N 03° E, 55° N 04° E, pour longer ensuite le parallèle 55° N en direction de l'est, puis la frontière séparant le Danemark de la République fédérale d'Allemagne, jusqu'à la mer Baltique. Elle suit alors la côte de la République fédérale d'Allemagne sur la mer Baltique jusqu'à la frontière entre la République fédérale d'Allemagne et la Repúblique Démocratique Allemande; puis elle longe cette frontière, les frontières occidentales de la République Socialiste Tchécoslovaque et de l'Autriche, la frontière Suisse-Austriche, la frontière Liechtenstein-Autriche, puis de nouveau la frontière Suisse-Autriche, pour se diriger ensuite vers l'est en longeant les frontières méridionales de l'Autrich et de la Hongrie; de là, elle suit la frontière entre la Hongrie et la Roumanie, puis la frontière de l'URSS avec la Hongrie, la République Socialiste Tchécoslovaque et la Pologne jusqu'à la côte de la mer Baltique. Ensuite elle longe la côte soviétique de la mer Baltique, suit les frontières entre la Finlande et l'URSS et entre la Norvége et l'URSS, passe par le point 70° N 32° E, pour enfin rejoindre le Pôle Nord en longeant le méridien 32° E.

27/108 *Subdivision de zone 1D:*

Cette subdivision est délimitée par une ligne partant du point de rencontre des frontières de l'URSS, de la Hongrie et de la Roumanie pour se diriger vers l'ouest et longer les frontières méridionales de la Hongrie et de l'Autrich jusqu'à la frontière de la Suisse avec l'Italie; elle longe ensuite la frontière France-Italie jusqu'à la mer Mériderranée et, de là, passe par les points 43° N 10° E, 41° N 10° E et 41° N 07° E; de là, elle suit le méridien 07° E jusqu'à la côte de l'Afrique du Nord, puis longe cette côte en passant par Tunis, Tripoli et Benghazi jusqu'à la frontière de la Libye avec la République Arabe d'Egypte. Elle continue ensuite le long de la côte vers Alexandrie, se dirige vers le Caire, puis suit le parallèle du Caire jusqu'à son point d'intersection avec le méridien 40° E, se dirige ensuite vers le nord en suivant le méridien 40° E jusqu'à l'intersection avec la frontière séparant la République Arabe Syrienne de la République d'Iraq et suivant cette frontièrre jusqu'à la frontière turque. Puis, elle suit la frontière séparant la Turquie de la République d'Iraq, de l'Iran et de l'URSS jusqu'à la côte de la mer Noire. De là, elle continue le long de la côte turque de la mer Noire pour atteindre le méridien 30° E et le suivre jusqu'à la frontière de la Roumanie avec l'URSS, longeant ensuite cette frontière jusqu'à point de rencontre des frontières de l'URSS, de la Hongrie et de la Roumanie.

27/109 *Subdivision de zone 1E:*

(ZLARN-2)

Cette subdivision est délimitée par une ligne qui, partant du point 50° N 20° W, passe par les points 40° N 20° W, 40° N 50° W, 30° N 39° W, 30° N 10° W, 31° N 10° W et 31° N 10° E; elle longe ensuite la frontière de la Libye avec la Tunisie jusqu'à la Méditerranée et de là, elle longe la côte tunisienne jusqu'à son point d'intersection avec le méridien 10° E, qu'elle suit jusqu'au point 43° N 10° E. Elle longe ensuite les frontières franco-italienne et italo-suisse, puis les frontières séparant l'Austriche de la Suisse, du Liechtenstein, puis à nouveau de la Suisse. Elle longe ensuite la frontière séparant la Suisse de la République fédérale d'Allemagne, puis les frontières séparant la France de la République fédérale d'Allemagne, du Luxembourg et de la Belgique, jusqu'à la côte de la Manche, et de là, partant vers l'ouest, traverse les eaux territoriales entre les îles Anglo-Normandes et la côte française pour atteindre le point 50° N 10° W et revenir à son point de départ 50° N 20° W.

27/110 *Zone des lignes aériennes régionales et nationales — 2:*

(ZLARN-2)

Cette zone est délimitée par une ligne qui, partant du Pôpe Nord, passe par le point 70° N 32° E, pour longer ensuite la frontière entre la Norvège et l'URSS et entre la Finlande et l'URSS jusqu'à la côte de la mer Baltique, suivre ensuite les eaux territoriales soviétiques le long de la côte de la mer Baltique, jusqu'à la frontière séparant l'URSS de la Pologne, puis longer la frontière séparant l'URSS des pays suivants: Pologne, République Socialiste Tchécoslovaque, Hongrie et Roumanie jusqu'au point d'intersection de la côte de la mer Noire avec le méridien 30° E; elle suit ce méridien jusqu'à la côte turque de la mer Noire, longe cette côte jusqu'à l'intersection des frontières de la Turquie et de l'URSS et, de là, longe leur frontière commune et la frontière Iran-URSS jusqu'à la mer Caspienne, puis la côte iranienne de cette mer. De là, elle suit la frontière méridionale de l'URSS jusqu'au point de rencontre des frontières de la Mongolie, de la République Populaire de Chine et de l'URSS à environ 49° N 88° E, pour suivre ensuite le méridien 88° E jusqu'au parallèle 55° N et longer ce parallèle jusqu'à 60° E, puis rejoindre le Pôle Nord en suivant le méridien 60° E.

27/111 *Subdivision de zone 2A:*

Cette subdivision est délimitée par une ligne qui, partant du Pôle Nord, suit le méridien 32° E jusqu'au point 70° N 32° E pour suivre ensuite la frontière entre la Norvège et l'URSS et entre la Finlande et l'URSS jusqu'à la côte de la mer Baltique, puis longer les eaux territoriales soviétiques de la mer Baltique jusqu'au point 55° N 20° E; de là, passer par Moscou et, par le point 55° N 60° E, rejoindre le Pôle Nord en suivant le méridien 60° E.

27/112 *Subdivision de zone 2B:*

Cette subdivision est délimitée par une ligne qui, partant du point 55° N 88° E, passe par les points 55° N 60° E, 47° N 53° E pour suivre ensuite la côte orientale de la mer Caspienne jusqu'à la côte de l'Iran et, de là, se diriger vers l'est en suivant la frontière méridionale de l'URSS jusqu'au point de rencontre des frontières de la Mongolie, de la République Populaire de Chine et de l'URSS à environ 49° N 88° E, et longer ensuite le méridien 88° E pour revenir à son point de départ 55° N 88° E.

27/113 *Subdivision de zone 2C:*

Cette subdivision est délimitée par une ligne qui, partant du point 55° N 60° E, va jusqu'à Moscou et, de là, jusqu'au point 55° N 20° E, pour se diriger ensuite vers le sud en suivant la frontière séparant l'URSS de la Pologne, puis la frontière entre l'URSS et les pays suivants: Pologne, République Socialiste Tchécoslovaque, Hongrie et Roumanie, jusqu'à la côte de la mer Noire à son point d'intersection avec le méridien 30° E. Cette ligne suit alors le méridien 30° E jusqu'à la côte turque de la mer Noire et longe ensuite cette côte jusqu'à son intersection avec la frontière entre la Turquie et l'URSS; de là, elle longe leur frontière commune et la frontière Iran-URSS jusqu'à la mer Caspienne, puis suit la côte méridionale de la mer Caspienne et se dirige ensuite vers le nord en suivant la côte orientale de cette mer et, passant par le point 47° N 53° E, revient à son point de départ 55° N 60° E.

27/114 *Zone des lignes aériennes régionales et nationales — 3:*

(ZLARN-3)

Cette zone est délimitée par une ligne qui, partant du Pôle Nord, suit le méridien 60° E jusqu'au point 55° N 60° E pour longer ensuite le parallèle 55° N jusqu'à son point d'intersection avec le méridien 88° E et de là suivre ce méridien jusqu'au point de rencontre des frontières de la Mongolie, de la République Populaire de Chine et de l'URSS à environ 49° N 88° E, puis longer la frontière Mongolie-République Populaire de Chine et URSS-République Populaire de Chine jusqu'à la côte. Elle passe alors entre les eaux territoriales soviétiques et japonaises et, par les points 43° N 147° E, 50° N 164° E et 65° N 170° W, rejoint le Pôle Nord en suivant le méridien 170° W.

27/115 *Subdivision de zone 3A:*

Cette subdivision est délimitée par une ligne qui, partant du Pôle Nord, suit le méridien 60° E jusqu'au point 55° N 60° E en longeant le parallèle 55° N jusqu'à son point d'intersection avec le méridien 88° E; de là, elle passe par les points 60° N 88° E et 60° N 110° E et rejoint le Pôle Nord en suivant le méridien 110° E.

27/116 *Subdivision de zone 3B:*

Cette subdivision est délimitée par une ligne qui, partant du Pôle Nord, suit le méridien 110° E et passe ensuite par les points 60° N 110° E, 60° N 147° E, 43° N 147° E, 50° N 164° E et 65° N 170° W et rejoint le Pôle Nord en suivant le méridien 170° W.

27/117 *Subdivision de zone 3C:*

Cette subdivision est délimitée par une ligne qui, partant du point 60° N 88° E, rejoint le point de recontre des frontières entre la Mongolie, la République Populaire de Chine et l'URSS, à environ 49° E, pour suivre la frontière Mongolie-République Populaire de Chine et la frontière URSS-République Populaire de Chine jusqu'à la côte. Elle passe ensuite entre les eaux territoriales soviétiques et japonaises, passe par les points 43° N 147° E, 60° N 147° E, et rejoint son point de départ 60° N 88° E.

27/118 *Zone des lignes aériennes régionales et nationales — 4:*

(ZLARN-4)

Cette zone est délimitée par une ligne qui, partant du point 30° N 39° W, passe par les points suivantes: 10° N 20° W, 05° S 20° W, 05° S 12° E, longe la frontière séparant la République Populaire du Congo de la République Populaire d'Angola, puis suit la frontière septentrionale de la République du Zaire, longe celle de la République Populaire du Congo, de l'Empire Centrafricain et du Soudan, et de là se dirige vers le nord le long de la frontière occidentale du Soudan; à partir de là, cette ligne suit la frontière occidentale de la République Arabe d'Egypte, continue vers le nord jusqu'à la Méditerranée et longe les côtes méditerranéenne et atlantique de l'Afrique du Nord jusqu'au point situé à 30° N 10° W. De là, elle suit le parallèle 30° N en direction de l'ouest pour revenir à son point de départ 30° N 39° W.

27/119 *Subdivision de zone 4A:*

Cette subdivision est délimitée par une ligne qui, partant du point 30° N 39° W, passe par le point 21° N 31° W, puis par Gao et Zinder. De cette ville, longe la frontière septentrionale du Nigeria jusqu'à un point situé à l'ouest de N'Djamena; elle longe alors de parallèle de N'Djamena jusqu'au point 12° N 22° E. Elle se dirige ensuite vers le nord en suivant la frontière occidentale du Soudan et la frontière occidentale de la République Arabe d'Egypte jusqu'à la Méditerranée, pour longer ensuite les côtes méditerranéenne et atlantique de l'Afrique du Nord jusqu'au point 30° N 10° W et, de là, suivre le parallèle 30° N jusqu'à son point de départ 30° N 39° W.

27/120 *Subdivision de zone 4B:*

Cette subdivision est délimitée par une ligne qui, partant du point 21° N 31° W, passe par les points 10° N 20° W, 05° S 20° W et 05° S 12° E et, de là, longe la frontière méridionale de la République Populaire du Congo, de l'Empire Centrafricain, jusqu'au point de recontre des frontières de la République du Zaire, du Soudan et de l'Empire Centrafricain. De là, elle longe la frontière occidentale du Soudan jusqu'au point 12° N 22° E, pour longer ensuite le parallèle de N'Djamena jusqu'à la frontiére du Nigeria. De là, elle se dirige vers l'ouest en suivant cette frontière jusqu'au point 13°12' N 10°45' E, passe par Zinder et Gao, et revient à son point de départ 21° N 31° W.

27/121 *Zone des lignes aériennes régionales et nationales — 5:*

(ZLARN-5)

Cette zone est délimitée par une ligne qui, partant du point 41° N 40° E, passe par le point 37° N 40° E, pour longer ensuite la frontière séparant la Turquie de la République Arabe Syrienne jusqu'à la côte méditerranéenne et, de là, arriver au point où la frontière commune de la Libye et de la République Arabe d'Egypte rejoint la côte de l'Afrique du Nord, Chypre restant en dehors de la zone. Elle se dirige ensuite vers le Sud, en suivant la frontière occidentale de la République Arabe d'Egypte et du Soudan jusqu'à la frontière du Kenya. De là, elle se dirige vers l'est en longeant la frontière nord du Kenya, et, en direction du sud, elle suit la frontière séparant le Kenya de la Somalie pour rejoindre la côte orientale de l'Afrique au point 02° S 41° E. Elle continue en passant par les points 02° S 73° E et 37° N 73° E, longe en direction de l'est la frontière entre la République d'Afghanistan et le Pakistan; de là, en direction de l'ouest, elle suit la frontière méridionale de l'URSS jusqu'à la mer Caspienne. Elle longe ensuite la frontière nord de l'Iran et de la Turquie jusqu'à son point de départ 41° N 40° E.

27/122 *Subdivision de zone 5A:*

Cette subdivision est délimitée par une ligne qui, partant du point 37° N 40° E, suit la frontière séparant la Turquie de la République Arabe Syrienne jusqu'à la côte méditerranéenne et, de là, gagne le point

d'intersection de la frontière égypto-libyenne et de la côte de l'Afrique du Nord, sans passer par Chypre. Elle se dirige ensuite vers le sud, longe la frontière occidentale de la République Arabe d'Egypte et suit, vers l'est, la frontière commune à la République Arabe d'Egypte et au Soudan pour atteindre le point 24° N 37° E. Elle continue en passant par les points 11°45' N 42° E, 11°45' N 55° E, 20° N 52° E, 26° N 52° E, et longe les frontières séparant l'Iran de la République d'Iraq et la République d'Iraq de la Turquie, pour revenir à son point de départ 37° N 40° E.

27/123 *Subdivision de zone 5B:*

Cette subdivision est délimitée par une ligne qui, partant du point 41° N 40° E, passe par le point 37° N 40° E puis, se dirigeant vers l'est, longe la frontière séparant la Turquie de la République Arabe Syrienne et de la République d'Iraq, et la frontière séparant la République d'Iraq et l'Iran jusqu'au point 30° N 49° E, et de là coupe le golfe Persique en son milieu en passant par 26° N 52° E et 24° N 60° E, Bombay et 37° N 73° E, pour longer ensuite, en direction de l'est, la frontière séparant la République d'Afghanistan du Pakistan et, en direction de l'ouest, la frontière méridionale de l'URSS jusqu'à la mer Caspienne. De là, elle suit la frontière nord de l'Iran et de la Turquie jusqu'à 41° N 40° E.

27/124 *Subdivision de zone 5C:*

Cette subdivision est délimitée par une ligne qui, partant du point 26° N 52° E, passe par les points 13° N 52° E, 13° N 54° E, 02° S 54° E, 02° S 73° E Bombay, 24° N 60° E et, de là, coup le golfe Persique en son milieu et rejoint le point 26° N 52° E.

27/125 *Subdivision de zone 5D:*

Cette subdivision est délimitée par une ligne qui, partant du point de rencontre des frontières de la République Arabe d'Egypte, de la Libye et du Soudan, suit, en direction du sud la frontière occidentale du Soudan jusqu'à la frontière du Kenya, longe ensuite la frontière nord du Kenya, pour se diriger vers le sud en suivant la frontière séparant le Kenya de la Somalie jusqu'à la côte orientale de l'Afrique, en un point situé à 02° S 42° E, puis passe par les points 02° S 54° E, 13° N 54° E, 13° N 52° E, 12° N 44° E et, de là, se dirige vers le nord-ouest, coupant la mer Rouge en son milieu jusqu'au point 24° N 37° E. De là, elle longe la frontière méridionale de la République Arabe d'Egypte pour revenir à son point de départ.

27/126 *Zone des lignes aériennes régionales et nationales — 6:*

(ZLARN-6)

Cette zone est délimitée par une ligne qui, partant approximativement du point 49° 88° E, longe la frontière séparant la Chine et l'URSS, l'Afghanistan et le Pakistan, l'Iran et le Pakistan jusqu'au point 23° N 61° E et, de là, rejoint Bombay, puis longe le méridien 73° E passe par les points 02° S 73° E, 02° S 92° E, 10° S 92° E, 10° S 141° E, 00° 141° E, 00° 160° E, 03° 30' N 160° E, 03° 30 N 170° W, 10° N 170° W, 50° N 164° E, 43° N 147° E. De là, elle passe, en direction de l'ouest, entre les eaux territoriales japonaises et soviétiques, elle suit les frontières nord et septentrionale de la Chine, pour rejoindre son point de départ, approximativement 49° N 88° E.

27/127 *Subdivision de zone 6A:*

Cette subdivision est délimitée par une ligne qui, partant du point 37° N 75° E, longe la frontière séparant le Pakistan de la République d'Afghanistan, l'Iran du Pakistan jusqu'au point 23° N 61° E et, de là, continue jusqu'á Bombay, puis jusqu'au point 24° N 80° E et, de là, jusqu'à Calcultta. Elle longe ensuite da côte du Bangladesh et de la Birmanie jusqu'à la frontière séparant la Birmanie de la Thaïlande puis le long de cette frontière et de celle séparant la Birmanie de la Repúblique Démocratique Populaire Lao pour remonter le long de la frontière séparant la République Populaire de Chine de la Birmanie. De là elle se dirige vers l'ouest en longeant la frontière méridionale de la République Populaire de Chine pour rejoindre son point de départ 37° N 75° E.

27/128 *Subdivison de zone 6B:*

Cette subdivison est délimitée par une ligne qui, partant du point 39° 49' 41" N 124° 10' 06" E, passe par les points 39° 31' 51" N 124° 06' 31" E, 39° N 124° E et atteint le point 32° 30' N 124° E. Entre le point 32° 30' N 124° E et le point 25° N 123° E, la limite de cette subdivison n'est pas définie. Du point 25° N 123° E, la ligne passe par les points 21° N 121° 30' E, 20° N 120° E, 20° N 176° W, 50° N 164° E et 43° N 147° E, puis se dirige vers l'ouest en passant entre les eaux territoriales japonaises et soviétiques,

et longe ensuite la frontière séparant la République Populaire Démocratique de Corée de l'URSS, puis la frontière séparant la République Populaire de Chine de la République Populaire Démocratique de Corée, pour revenir à son point de depart 39° 49' 41" N 124° 10' 06" E.

27/129 *Subdivison de zone 6C:*

Cette subdivison de zone est délimitée par une ligne qui, partant du point 20° N 130° E, passe par les points 04° N 130° E, 04° N 118° E, et de là longe les frontières méridionales de Sabah et de Sarawak jusqu'à la côte puis elle se dirige vers le sud en suivant la côte occidentale de Bornéo jusqu'à méridien 110° E qu'elle longe jusqu'à point 10° S 110° E. De là, elle passe par les points 10° S 141° E, 00° 141° E, 00° 160° E, 03° 30' N 160° E, 03° 30' N 170° W, 10° N 170° W, 20° N 176° W et, de ce dernier point , rejoint le point 20° N 130° E.

27/130 *Subdivison de zone 6D:*

Cette subdivison est délimitée par une ligne qui, partant du point de rencontre des frontières de la République Populaire de Chine, de l'Inde et de la Birmanie, se dirige vers le sud en longeant les frontières séparant la Birmanie de l'Inde et la Birmanie du Bangladesh, atteint le golfe du Bengale; de là, elle longe la côte de Birmanie jusqu'à son point le plus méridional. Elle se dirige ensuite vers l'île de Weh (au large de la côte septentrionale de Sumatra) et de là passe par les points 02° S 92° E, 10° S 92° E jusqu'au point 10° S 110° E; de là, elle se dirige vers l'est jusqu'au point 10° S 141° E et remonte vers le nord jusqu'au point 00° 141° E, passe par le point 04° N 130° E et les points 20° N 130° E et 20° N 113° E. Puis, elle se dirige vers le sud en contournant l'île de Haïnan; elle longe ensuite la frontière separant la République Populaire de Chine du Viet Nam, puis les frontières separant la République Populaire de Chine de la République Démocratique Populaire Lao et la République Populaire de Chine de la Birmanie pour revenir à son point de départ au point de rencontre des frontières de la République Populaire de Chine, de l'Inde et de la Birmanie.

27/131 *Subdivison de zone 6E:*

Cette subdivison est délimitée par une ligne qui, partant du point 20° N 73° E, passe par les points 02° S 73° E, 02° S 92° E, puis par l'île de Weh (au large de la côte septentrionale de Sumatra), jusqu'au point 10° N 97° E, de là, elle longe de la côte de Birmanie, du Bangladesh et de l'Inde, et atteint Calcutta pour continuer ensuite, par le point 24° N 80° E, jusqu'à son point de départ 20° N 73° E.

27/132 *Subdivison de zone 6F:*

Cette subdivison est délimitée par une ligne qui, partant du point 25° N 123° E, passe par les points 21° N 121° 30' E, 20° N 120° E, 20° N 113° E, puis contourne par le sud l'île de Haïnan, puis longe les frontières entre a République Populaire de Chine et le Viet Nam, la République Démocratique Populaire Lao et la Birmanie jusqu'au point de rencontre des frontières de la République Populaire de Chine, de l'Inde et de la Birmanie; elle se dirige ensuite vers le sud le long des frontières séparant la Birmanie de l'Inde et du Bangladesh jusqu'au golfe du Bengale. Elle longe ensuite la côte de la Birmanie jusqu'à son point le plus méridional, puis se dirige vers l'île de Weh (au large de la côte septentrionale de Sumatra). Elle passe ensuite par les points 02° S 92° E, 10° S 92° E et 10° S 110° E, puis se dirige vers le nord en suivant le méridien 110° E; elle longe ensuite la limite de la subdivison 6C jusqu'aux 20° N 130° E, 43° N 147° E; elle se dirige vers l'ouest entre les eaux territorials du Japon et de l'URSS et suit ça frontière séparant la République Démocratique Populaire de Corée de l'URSS, puis la frontière séparant la République Populaire de Chine de la République Démocratique Populaire de Corée jusqu'aux points 39° 49' 41" N 124° 10' 06" E, 39° 31' 51" N 124° 06' 31" E, 39° N 124°E, puis jusqu'au point 32° 30' N 124° E.

Entre les points 32° 30° N 124° E et 25° N 123° E, la limite de cette subdivison n'est pas définie.

27/132A *Subdivison de zone 6G:*

Cette subdivison est délimitée par une ligne qui, partant du point 32°30' N 124° E se dirige vers le nord jusqu'au point 39° N 124° E, passe par le point 39° 31' 51" N 124° 06' 31" E puis atteint le point 39° 49' 41" N 124° 10' 06" E sur la frontière séparant la République Populaire de Chine et la République Populaire Démocratique de Corée. Elle longe ensuite la frontière de la République Populaire de Chine jusqu'au point de recontre des frontières de l'Inde et de la Birmanie. De là, elle se dirige vers le sud en longeant les frontières séparant l'Inde de la Birmanie et le Bangladesh de la Birmanie, jusqu'au golfe de Bengale. Elle longe ensuite la côte de Birmanie jusqu'à son point le plus méridional, se dirige vers l'île de Weh (au large de la côte septentrionale de Sumatra), pour continuer ensuite par les points 02° S 92° E et 10° S 92° E,

jusqu'au point 10° S 110° E. Puis elle se dirige vers l'est jusqu'au point 10° S 141° E, ensuite vers le nord jusqu'au point 00° 141° E et passe par les points 04° N 130° E, 20° N 130° E et 20° N 120° 40' E. De là, elle se dirige vers le nord jusqu'aux points 21° N 121° 30' E et 25° N 123° E.

Entre les points 25° N 123° E et 32° 30' N 124° E, la limite de cette subdivison de zone n'est pas définie.

Dans les régions où les subdivisons 6D, 6F et 6G sont communes, les fréquences alloties à la subdivison de zone 6G doivent être utilisées uniquement par les stations aéronautiques de la République Populaire de Chine; les fréquences alloties aux subdivisons de zone 6D et 6F doivent être utilisées uniquement par les stations aéronautiques des administrations des autres pays situés dans les régions communes. Dans ces régions communes également, l'utilisation opérationnelle par la République Populaire de Chine des fréquences alloties à la subdivision 6G doit être limitée à la zone définie par une ligne qui, partant du point 21° 32' 52" N 108° E, passe par le points 20° N 108° E, 20° N 107° E, 18° N 107° E, 18° N 108° E, 15° N 110° E, 10° N 110° E, 06° N 108° E, 03° 30' N 112° E, 04° N 113° E, 08° N 116° E, 10° N 118° E, 14° N 119° E, 18° N 119° E jusqu'au point 20° N 120° 40' E, et de là, longe la limite de la subdivison de zone 6D jusqu'au point 21° 32' 52' N 108° E.

27/133 *Zone des lignes áeriennes régionales et nationales — 7:*

(ZLARN-7)

Cette zone est délimitée par une ligne qui, partant du Pôle Sud, suit le méridien 20° W jusqu'au point 05° S 20° W; elle suit la parallèle 05° jusqu'au point 05° S 12° E, longe ensuite la frontière séparant la République Populaire du Congo de la République Populaire d'Angola, la frontière septentrionale de la République du Zaïre, la frontière séparant l'Ougande du Soudan, et la frontière séparant la Kenya des pays suivants: Soudan, Ethiopie et Somalie. Elle passe ensuite par les points 02° S 42° E, 02° S 60° E et sur le méridien 60° E jusqu'au point 11° S 60° E; elle rejoint enfin le Pôle Sud en passant par les points 11° S 65° E, 40° S 65° E et 40° S 60° E.

27/134 *Subdivison de zone 7A:*

Cette subdivison est délimitée par une ligne qui, partant du Pôle Sud, suit le méridien 20° W et passe ensuite par 05° S 20° W, 05° S 10° E, 40° S 10° E, 40° S 60° E et rejoint le Pôle Sud en suivant le méridien 60° E.

27/135 *Subdivison de zone 7B:*

Cette subdivison est délimitée par une ligne qui, partant du point 05° S 10° E, passe par le point 05° S 12° E pour longer la frontière séparant la République Populaire du Congo de la République Populaire d'Angola, puis la frontière septentrionale de la République du Zaïre jusqu'au point de rencontre des frontières de l'Ouganda, de la République du Zaïre et du Soudan. De là, elle suite les frontières orientales de la République du Zaïre, de la République Rwandaise, de la République du Burundi, puis à nouveau de la République du Zaïre. Elle longe ensuite les frontières méridionales de la République du Zaïre et de la République Populaire d'Angola jusqu'à la côte de l'Atlantique Sud, pase par le point 17° S 10° E et revient à son point de départ 05° S 10° E.

27/136 *Subdivision de zone 7C:*

Cette subdivision est délimitée par une ligne qui, partant du point de rencontre des frontières de l'Ouganda, de la République du Zaïre et du Sodan suit la frontière occidentale de l'Ouganda et de la Tanzanie et longe ensuite la frontière méridionale de la Tanzanie jusqu'à la côte. De là, elle passe par les points 11° S 41° E, 11° S 60° E, 02° S 60° E, 02° S 41° E jusqu'a la côte orientale de l'Afrique, puis se dirige vers le nord suivant les frontières orientale et septentrional du Kenya, puis la frontière septentrionale de l'Ouganda et rejoint le point de rencontre des frontières de la République du Zaïre, du Soudan et de, l'Ouganda.

27/137 *Subdivision de zone 7D:*

Cette subdivison est délimitée par une ligne qui, partant de la frontière séparant la Tanzanie du Mozambique sur le lac Nyassa, se dirige vers le sud en suivant sur toute sa longuer la frontière occidentale du Mozambique jusqu'à la côte orientale de l'Afrique; elle passe ensuite par les points 27° S 33° E, 40° S 33° E, 40° S 65° E, 11° S 65° E, 11° S 41° E pour longer la frontière septentrionale du Mozambique jusqu'au lac Nyassa.

27/138 *Subdivision de zone 7E:*

Cette subdivison est délimitée par une ligne qui, partant du point 17° S 10° E, passe par les points 40° S 10° E, 40° S 33° E, 27° S 33° E puis longe sur toute sa longueur la frontière occidentale du Mozambique, puis la partie de la frontière occidentale de la Tanzanie allant jusqu'à la pointe nord du lac Nyassa. De là, elle suit la frontière séparant le Malawi de la Tanzanie et celle qui sépara la Zambie de la Tanzanie, pour longer ensuite les frontières séparant la République du Zaïre de la Zambie, la République Populaire d'Angola de la Zambie, et la République Populaire d'Angola de la Namibie jusqu'à la côte, pour revenir à son point de départ 17° S 10° E.

27/138A *Subdivision de zone 7F:*

Cette subdivison est délimitée par une ligne qui, partant du point 05° S 10° E, passe par le point 05° S 12° E et longe la frontière séparant la République Populaire du Congo et la République Populaire d'Angola, jusqu'à point de rencontre des frontières de la République Populaire du Congo, de la République Populaire d'Angola et de la République du Zaire; de là, elle suit la frontière séparant la République Populaire d'Angola et la République du Zaïre jusqu'à la côte Atlantique qu'elle longe jusqu'au fleuve Zaïre; elle longe ensuite les frontières nord, est et sud de la République Populaire d'Angola jusqu'à la côte de l'Atlantique Sud, passe par le point 17° S 10° E et revient à son point de départ 05° S 10° E.

27/139 *Zone des lignes aériennes régionales et nationales — 8:*

(ZLARN-8)

Cette zone est délimitée par une ligne qui, partant du Pôle Sud, suit, le méridien 60° E jusqu'au point 40° S 60° E et passe ensuite par les points 40° S 65° E, 11° S 65° E, 11° S 60° E, 02° S 60° E, 02° S 92° E, 10° S 92° E, 10° S 110° E pour rejoindre le Pôle Sud en suivant le méridien 110° E.

27/140 SUP

27/141 *Zone des lignes aériennes régionales et nationales — 9:*

(ZLARN-9)

Cette zone est délimitée par une ligne qui, partant du Pôle Sud, suit le méridien 160° E jusqu'au point 27° S 160° E; de là ele passe par les points 19° S 153° E, 10° S 145° E, 10° S 141° E, 00° 141° E, 00° 160° E, 03° 30' N 160° E, 03° 30' N 120° W, pour rejoindre le Pôle Sud en suivant le méridien 120° W.

27/142 SUP

27/143 *Subdivision de zone 9B:*

La ligne délimitant cette subdivision est définie par les points 00° 141° E, 10° S 141° E, 10° S 145° E, 27° S 160° E, 27° S 157° W, 03° 30' N 157° W, 03° 30' N 160° E, 00° 160° E, 00° 141° E.

27/144 *Subdivision de zone 9C:*

La ligne délimitant cette subdivision part du Pôle Sud, suit le méridien 170° W jusqu'à 03° 30' N, passe par le point 03° 30' N 120° W et rejoint le Pôle Sud en suivant le méridien 120° W.

27/145 *Subdivision de zone 9D:*

La ligne délimitant cette subdivision part du Pôle Sud, suit le méridien 160° E jusqu'au point 27° S 160° E, passe par le point 27° S 170° W et rejoint le Pôle Sud en suivant le méridien 170° W.

27/145A *Zone des lignes aériennes régionales et nationales — 10:*

(ZLARN-10)

Cette zone est délimitée par une ligne qui, partant du point 50° N 164° E, passe par le point 66° N 169° W, puis longe le méridien 169° W jusqu'au Pôle Nord. Elle passe ensuite par les points 82° N 30° E, 82° N

00°, 73° N 00°, 73° N 15° W, puis longe le méridien 15° W jusqu'au point 72° N 15° W. Elle passe ensuite par les points 40° N 50° W, 40° N 65° W, 44° 30' N 73° W, 41° N 81° W, 41° N 88° W,48° N 91° W, 48° N 127° W, 50° N 130° W, pour se diriger ensuite versa l'ouest et revenir à son point de départ 50° N 164°E.

27/146 *Subdivision de zone 10A:*

Cette subdivison est délimitée par une ligne qui, partant du point 50° N 164° E, passe par le point 66° N 169° W; de là, elle suit le méridien 169° W jusqu'au Pôle Nord, passe par le point 50° N 130° W et revenir ensuite vers l'ouest jusqu'à son point de départ 50° N 164° E.

27/147 *Subdivision de zone 10B:*

La ligne délimitant cette zone part du point 57° N 140° W, passe au Pôle Nord, puis par les points 48° N 91° W, 48° N 127° W, 57° N 139° W, et revient à son point de départ 57° N 140° W.

27/148 *Subdivision de zone 10C:*

La ligne délimitant cette subdivision est définie par les points 57° N 140° W, 60° N 140° W, 60° N 91° W, 48° N 91° W, 48° N 127° W, 57° N 139° W, 57° N 140° W.

27/149 *Subdivision de zone 10D:*

La ligne délimitant cette subdivision part du point 48° N 98° W, puis passe par le Pôle Nord et par les points 69° N 45° W, 61° N 70° W, 45° N 72° W, 41° N 81° W, 41° N 88° W, 48° N 91° W, 48° N 98° W.

27/150 *Subdivision de zone 10E:*

La ligne délimitant cette subdivision passe par les points 45° N 74° W, 61° W 72° W 69° N 47° W, puis par le Pôle Nord et par les points 72° N 15° W, 40° N 50° W, 40° N 65° W, pour revenir à son point de départ 45° N 74° W.

27/150A *Subdivision de zone 10F:*

La ligne délimitant cette subdivision part du Pôle Nord et passe par les points 82° N 30° E, 82° N 00°, 73° N 00°, 73° N 20° W, 70° N 20° W, 63° 30' N 39° W, 58° 30' N 43° W, 58° 30' N 50° W, 63° 30' N 55° 44' W, 65° 30' N 58° 39' W, 74° N 68° 18' W, 76° N 76° W, 78° N 75° W, 82° N 60° W, et revient à son de départ au Pôle Nord.

27/150B *Zone des lignes aériennes régionales et nationales — 11:*

(ZLARN-11)

Cette zone est délimitée par une ligne qui, partant du point 29° N 180°, passe par les points 50° N 164° E, 50° N 127° W, pour longer ensuite la frontière séparant les États-Unis d'Amérique du Canada jusqu'au point 46° N 67° W; elle passe ensuite par les points 40° N 65° W, 40° N 50° W, 25° N 35° W, 25° N 98° W, 33° N 119° W, 33° N 153° W, 29° N 153° W, pour revenir à son point de départ 29° N 180°.

27/151 *Subdivision de zone 11A:*

La ligne délimitant cette subdivision pat du point 29° N 180°, puis passe par les points 50° N 164° E, 50° N 130° W, 33° N 130° W, 33° N 153° W, 29° N 153° W, pour revenir à son point de départ 29° N 180°.

27/152 *Subdivision de zone 11B:*

Cette subdivison est délimitée par une ligne qui, partant du point 50° N 130° W, passe par les points 33° N 130° W, 33° N 119° W, 25° N 98° W, 25° N 65° W, 40° N 65° W, 46° N 67° W. De là, elle suit la frontière entre les États-Unis d'Amérique et le Canada, passant pat le point 50° N 127° W, pour revenir à son point de départ 50° N 130° W.

27/152A *Subdivision de zone 11C:*

Cette divison est délimitée par une ligne qui, partant du point 25° N 65°W, passe par les points 40° N 65° W, 40° N 50° W, 25° N 35° W, pour revenir à son point de départ 25° N 65° W.

27/152B *Zone des lignes aériennes régionales et nationales — 12:*

(ZLARN-12)

Cette zone est délimitée par une ligne qui, partant du point 03° 30' N 170° W, passe par le point 10° N 170° W, pour longer ensuite la ligne séparant les Régions 2 et 3 de l'UIT jusqu'au point 29° N 180°; elle passe ensuite par les points 29° N 153° W, 33° N 153° W, 33° N 120° W, 35° N 120° W, 32° N 104° W, 25° N 91° W, 26° N 91° W, 26° N 79° W, 27° N 79° W, 27° N 76° 30' W, 25° N 70° W, 25° N 35° W, pour longer ensuite la ligne séparant les Régions 1 et 2 de l'UIT, jusqu'au point 00° 20° W. De là, elle passe par les points 00° 44° W, 04° 24' N 50° 39' W pour longer ensuite les frontières séparant le Brésil du Département français de la Guyane, du Surinam, de la Guyane, du Venezuela, de la Colombie, jusqu'au point de rencontre des frontières du Brésil, du Pérou et de la Colombie; elle longe ensuite les frontières séparant le Pérou de la Colombie et de l'Equateur, jusqu'au point 04° S 93° W. De là, elle passe par les points 05° S 93° W, 05° S 120° W, 03° 30' N 120° W, pour revenir à son de départ 03° 30' N 170° W.

27/153 *Subdivision de zone 12A:*

La ligne délimitant cette subdivision part du point 03° 30' N 170° W, passe par le point 10° N 170° W, puis longe la ligne séparant les Régions 2 et 3 de l'UIT jusqu'au point 29° N 180°; elle passe par les points 29° N 153° W, 03° 30' N 153° W, pour revenir à son point de départ 03° 30' N 170° W.

27/154 *Subdivision de zone 12B:*

La ligne délimitant cette subdivision part du point 03° 30' N 153° W, suit la méridien 153° W jusqu'au point 33° N 153° W et passe par les points 33° N 120° W, 17° N 115° W, 14° N 93° W, 02° N 86° W, 02° N 93° W, 05° S 93° W, 05° S 120° W, 03° 30' N 120° W, pour revenir à son point de départ 03° 30' N 153° W.

27/155 *Subdivision de zone 12C*

La ligne délimitant cette subdivision part du point 33° N 120° W, passe par les points 35° N 120° W, 32° N 104° W, 25° N 91° W, 23° N 83° W, 22° N 83° W, 13° N 90° W, 16° N 116° W, pour revenir à son point de départ 33° N 120° W.

27/156 *Subdivision de zone 12D:*

Cette subdivision est délimitée par une ligne qui, partant du point 20° N 91° W, passe par les points 26° N 91° W, 26° N 79° W, 27° N 76° 30' W, 26° N 73° W, 17° N 58° W, 10° N 58° W, puis par les villes de Panama et de Colon, les îles du Cygne et la ville de Belize, pour revenir à son point de départ 20° N 91° W.

27/157 *Subdivision de zone 12E:*

La ligne délimitant cette subdivision part du point 15° N 95° W et passe par les points 23° N 92° W, 23° N 85 W, 19° N 85° W, 09° N 77° W, 02° N 79° W, puis par le point 01° N 75° W, elle longe la frontière orientale et méridionale de l'Equateur jusqu'au point 04° S 81° W, de là, passe par les points 02° N 81° W, 02° N 86° W et 14° N 93° W, pour revenir à son point de départ au point 15° N 95° W.

27/158 *Subdivison de zone 12F:*

Cette subdivison est délimitée par une ligne qui, partant du point 02° N 79° W, passe par le point 08° N 83° W, longe la frontière séparant Panama de Costa Rica, passe par les points 10° N 83° W, 13° N 83° W, 13° N 70° W, 08° N 70° W, 06° N 67° W, 01° N 66° W, longe la frontière séparant le Brésil de la Colombie jusqu'au point 04° S 70° W et, de là, suit la frontière séparant la Colombie du Pérou puis la frontière séparant la Colombie de l'Equateur, pour revenir á son point de départ 02° N 79° W.

27/159 *Subdivison de zone 12G:*

Cette subdivison de zone est délimitée par une ligne qui, partant du point 07° N 73° W, passe par les points 14° N 73° W, 14° N 58° W, 01°31' N 58° W; elle longe ensuite les frontiéres du Brésil avec la Guyane, le Venezuela, la Colombie, passe par les points 01°57' N 68° W, 05° N 69° W, pour revenir à son point de départ 07° N 73° W.

27/160 *Subdivison de zone 12H:*

Cette subdivison est délimitée par une ligne qui, partant du point 05° N 70° W, passe par les points 08°45' N 60° W, 08° N 58°W, 08° N 49° W, 04°10' N 51°36' W; elle longe ensuite les frontières séparant le Brésil du Département français de la Guyane, du Surinam, de la Guyane, du Venezuela et de la Colombie, jusqu'au point de rencontre des frontières du Brésil, de la Colombie et du Pérou, pour revenir à son point de départ 05° N 70° W.

27/161 *Subdivison de zone 12I:*

La ligne délimitant cette subdivision part du point 25° N 70° W, passe par le point 25° N 35° W, puis longe la ligne séparant les Régions 1 et 2 de l'UIT, jusqu'au point 00° 20° W; elle passe ensuite par les points 00° 44° W, 08° N 54° W, 08° N 58° W, 17° N 58° W, pour revenir à son point de départ 25° N 70° W.

27/161A *Subdivison de zone 12J:*

Cette subdivison est délimitée par une ligne qui, partant du point 04° S 93° W, passe par les points 02° N 93° W, 02' N 79° W, longe da frontière séparant l'Équateur de la Colombie jusqu'au point de rencontre des frontières de la Colombie, du Pérou et de l'Equateur, longe la frontière séparant le Pérou de l'Equateur, pour revenir à son point de départ 04° S 93° W.

27/161B *Zone des lignes aériennes régionales et nationales — 13:*

(ZLARN-13)

Cette zone est délimitée par une ligne qui, partant du Pôle Sud, suit le méridien 120° W jusqu'au point 05° S 120° W; de là, elle suit le parallèle 05° S jusqu'au point 05° S 93° W, passe par le point 04° S 82° W et suit les frontières mèridionales de l'Equateur, de la Colombie, du Venezuela, de la Guyane, du Surinam et du Département français de la Guyane, jusqu'au point 04° 24' N 50° 39' W. Elle passe ensuite par les point 04° 24' N 47° W, 00° 32° W, 00° 20° W, pour rejoindre le Pôle Sud en suivant le méridien 20° W.

27/162 *Subdivison de zone 13A:*

La ligne délimitant cette subdivision part du point 05° S 120° W, passe par les points 05° S 93° W, 04° S 82° W, 19° S 81° W, 57° S 81° W, 57° S 90° W, puis par le Pôle Sud, pour revenir à son point de départ 05° S 120° W.

27/163 *Subdivison de zone 13B:*

La ligne délimitant cette subdivision part du point 29° S 111° W, passe par les points 24° S 111° W, 24° S 104° W, 29° S 104° W, pour revenir à son point de départ 29° S 111° W.

27/164 *Subdivision de zone 13C:*

Cette subdivision est délimitée par une ligne qui, partant du point 15° S 47° W, passe par les points 20° S 44° W, 23° 19' S 42° W, 25° S 45° W, 22° 30' S 50° 39' W, 19° 52' S 58° W, puis longe les frontières du Brésil ave le Paraguay, la Bolivie, le Pérou, la Colombie, le Venezuela, la Guyane, le Surinam et le Département français de la Guyane. Elle passe ensuit par les points 04° 24' N 50° 39' W, 04° 24' N 47° W, pour revenir à son point de départ 15° S 47° W.

27/165 *Subdivision de zone 13D:*

Cette subdivison est délimitée par une ligne qui, partant du point 11° S 69° 30' W, longe la frontière entre la Bolivie et le Brésil, passe par le point 20° 10' S 58° W, longe ensuite la frontière entre la Bolivie et le Paraguay jusqu'au point 22° 30' S 62° 30' W, puis longe la frontière entre la Bolivie et l'Argentine et passe par le point 23° S 67° W; elle longe la frontière entre la Bolivie et le Chili, passe par le point 16° 30' S 69° 30' W, longe la frontière entre la Bolivie et le Pérou, pour revenir à son point de départ 11° S 69° 30' W.

27/165A *Subdivision de zone 13M:*

Cette subdivison est délimitée par une ligne qui, partant du point 19° S 81° W, passe par les points 04° S 82° W, 03° S 80° W, puis longe la frontière entre le Pérou et l'Equateur et entre le Pérou et la Colombie jusqu'au point 11° S 69° 30' W; elle longe ensuite la frontière entre le Pérou et la Bolovie jusqu'au point 17° 30' S 69° 30' W, pùis la frontière entre le Pérou et le Chili, pour revenir à son point de départ 19° S 81° W.

27/165B *Subdivision de zone 13N:*

Cette subdivison est délimitée par une ligne qui, partant du point 22° 30' S 62° 30' W, longe la frontière entre le Paraguay et la Bolivie jusqu'au point 20° 10' S 58° W; elle longe ensuite la frontière entre le Paraguay et le Brésil jusqu'au point 25° 50' S 54° 30' W, puis la frontière entre le Paraguay et l'Argentine, pour revenir à son point de départ 22° 30' S 62° 30' W.

27/166 *Subdivision de zone 13E:*

La ligne délimitant cette subdivision part du point 32° S 81° W, passe par le point 19° S 81° W, rejoint le point d'intersection de la côte avec la frontière séparant le Chili du Pérou, puis longe les frontières séparant le Chili du Pérou, de la Bolivie et de l'Argentine jusqu'au parallèle 32° S, pour revenir à son point de départ 32° S 81° W.

27/167 *Subdivision de zone 13F:*

La ligne délimitant cette subdivision part du point 57° S 81° W, passe par le point 32° S 81° W, jusqu'au croisement du parallèle 32° S avec la frontière entre le Chili et l'Argentine, puis par les points 52° S 67° W, 57° S 67° W, 57° S 40° W et par le Pôle Sud pour revenir à son point de départ 57° S 81° W.

27/168 *Subdivision de zone 13G:*

La ligne délimitant cette subdivision part du point 36° S 55° W, passe par le point d'intersection du parallèle 32° S avec la frontière entre l'Argentine et le Chili, se dirige vers le nord en suivant la frontière séparant l'Argentine de la Bolivie, du Paraguay, du Brésil et de l'Uruguay, pour revenir à son point de départ 36° S 55° W.

27/169 *Subdivision de zone 13H:*

La ligne délimitant cette subdivision part du point 57° S 90° W, passe par les points 57° S 70° W, 52° S 70° W, puis longe la frontière entre le Chili et l'Argentine jusqu'a son croisement avec le parallèle 32° S, passe par les points 36° S 55° W, 57° S 55° W, 57° S 25° W et par le Pôle Sud pour revenir à son point de départ 57° S 90° W.

27/170 *Subdivision de zone 13I:*

La ligne délimitant cette subdivision part du point 40° S 50° W, passe par le point 36° S 55° W, longe la frontière séparant l'Uruguay de l'Argentine et du Brésil, passe par le point 35° S 45° W, pour revenir à son point de départ 40° S 50° W.

27/171 *Subdivision de zone 13J:*

Cette subdivision est délimitée par une ligne qui, partant du point 15° S 47° W, passe par les points 20° S 44° W, 23° 19' S 42° W, 29° S 40° W, 35° S 45° W, puis longe les frontières du Brésil avec l'Uruguay, l'Argentine, le Paraguay et la Bolivie jusqu'au point 19°52' S 58° W. Elle passe ensuite par le point 18° S 57° 37' W, pour revenir à son point de départ 15° S 47° W.

27/172 *Subdivision de zone 13K:*

Cette subdivision est délimitée par une ligne qui, partant du point 22° 30' S 50° 39' W, passe par les points 25° S 45° W, 29° S 40° W, 20° S 32° W, 00° 32° W, 04° 24' N 47° W, 04° 24' N 50° 39' W, pour revenir à son point de départ 22° 30' S 50° 39' W.

27/173 *Subdivision de zone 13L:*

La ligne délimitant cette subdivision part du point 00° 32° W, passe par le point 00° 20° W, le Pôle Sud, les points 57° S 55° W, 36° S 55° W, 40° S 50° W, 20° S 32° W, pour revenir à son point de départ 00° 32° W.

27/173A *Zone des lignes aériennes régionales et nationales — 14:*

(ZLARN-14)

Cette zone est délimitée par une ligne qui, partant du Pôle Sud, suit le méridien 110° E jusqu'au point point 10° S 110° E; de là, elle passe par les points 10° S 145° E, 19° S 153° E, 27° S 160° E, pour rejoindre le Pôle Sud en suivant le méridien 160° E.

27/173B *Subdivision de zone 14A:*

Cette subdivison est délimitée cette subdivision part du Pôle Sud, suit le méridien 110° E jusqu'au point 19° S 110° E; de là, elle passe par les points 19° S 118° E, 24° S 120° E, 24° S 131° E, pour rejoindre le Pôle Sud en suivant le méridien 131° E.

27/173C *Subdivision de zone 14B:*

Cette subdivison est délimitée par une ligne qui, partant du point 19° S 110° E, passe par les points 10° S 110° E, 10° S 131° E, 24° S 131° E, 24° S 120° E, 19° S 118° E, pour revenir à son point de départ 19° S 110° E.

27/173D *Subdivision de zone 14C*

Cette subdivision est délimitée par une ligne qui, partant du point 24° S 131° E, passe par les points 10° S 131° E, 10° S 139° E, 24° S 139° E, pour revenir à son point de départ 24° S 131° E.

27/173E *Subdivision de zone 14D:*

La ligne délimitant cette subdivision part du Pôle Sud, suit le méridien 131° E jusqu'au point 24° S 131° E; de là, elle passe par les points 24° S 139° E, 27° S 139° E, 27° S 142° E, 34° S 142° E, 34° S 139° E, pour rejoindre le Pôle Sud en suivant le méridien 139° E.

27/173F *Subdivision de zone 14E:*

Cette subdivision est délimitée par une ligne qui part du point 24° S 139° E, suit le méridien 139° E jusqu'au point 10° S 139° E, passe para les points 10° S 145° E, 19° S 153° E, pour rejoindre son point de départ 24° S 139° E.

27/173G *Subdivision de zone 14F:*

Cette subdivision est délimitée par une ligne qui part du point 27° S 139° E, suit le méridien 139° E jusqu'au point 24° S 139° E, passe par les points 19° S 153° E, 27° S 160° E, pour rejoindre son point de départ 27° S 139° E.

27/173H *Subdivision de zone 14G:*

La ligne délimitant cette subdivision part du Pôle Sud, suit le méridien 139° E jusqu'au point 34° S 139° E, passe par les points 34° S 142° E, 27° S 142° E, 27° S 160° E et rejoint le Pôle Sud en suivant le méridien 160° E.

ARTICLE 3

Descreption des limites des zones d'allotissement et des zones de réception VOLMET

Zone VOLMET — AFRIQUE-OCÉAN INDIEN:

(AFI-MET)

27/174 La *zone d'allotissement AFI-MET* est délimitée par une ligne qui, partant du point 29° N 20° W, passe par les points 37° N 03° W, 37° N 36° E, 30° N 35° E, 10° N 52° E, 22° S 60° E, 35° S 35° E, 35° S 15° E, 08° S 15° W, 12° N 20° W, pour rejoindre de point 29° N 20° W.

27/175 La *zone de réception AFI-MET* est délimitée par une ligne qui, partant du point 37° N 03° W, passe par les points 37° N 36° E, 30° N 35° E, 10° N 52° E, 10° N 100° E, le Pôle Sud, les points 29° N 40° W, 29° N 20° W, pour rejoindre le point 37° N 03° W.

Zone VOLMET — ATLANTIQUE NORD:

(NAT-MET)

27/176 La *zone d'allotissement NAT-MET* est délimitée par une ligne qui, partant du point 41° N 78° W, passe par les points 51° N 55° W, 24° N 50° W, 24° N 74° W, pour rejoindre le point 41° N 78° W.

27/177 La *zone de réception NAT-MET* est délimitée par une ligne qui, partant du point 24° N 97° W, passe par les points 24° N 85° W, 75° N 85° W, 75° N 20° W, 00° 20° W, 00° 95° W, pour rejoindre le point 24° N 97° W.

Zone VOLMET — EUROPE:

(EUR-MET)

27/178 La *zone d'allotissement EUR-MET* est délimitée par une ligne qui, partant du point 33° N 12° W, passe par les points 54° N 12° W, 70° N 00°, 74° N 40° E, 40° N 36° E, 29° N 35° 30' E, 32° N 13° E, pour rejoindre de point 33° N 12° W.

27/179 La *zone de réception EUR-MET* est délimitée par une ligne qui, partant du point 15° N 20° W, passe par les points 40° N 50° W, 75° N 50° W, 75° N 45° E, 15° N 45° E, pour rejoindre de point 15° N 20° W.

Zone VOLMET — MOYEN-ORIENT:

(MID-MET)

27/180 La *zone d'allotissement MID-MET* est délimitée par une ligne qui, partant du point 50° N 80° E, passe par les points 29° N 80° E, 27° N 85° E, 16° N 78° E, 22° N 56° E, 16° N 42° E, 30° N 30° E, 51° N 30° E, 57° N 37° E, pour rejoindre le point 50° N 80° E.

27/181 La *zone de réception MID-MET* est délimitée par une ligne qui, partant du point 50° N 80° E, passe par les points 50° N 90° E, 35° N 90° E, 27° N 85° E, 16° N 78° E, 22° N 56° E, 16° N 42° E, 30° N 30° E, 51° N 30° E, 57° N 37° E, pour rejoindre le point 50° N 80° E.

Zone VOLMET — NORD CENTRE ASIE:

(NCA-MET)

27/181A La *zone d'allotissement NCA-MET* est délimitée par une ligne qui, partant du point 76° N 32° E, passe par les points 80° N 90° E, 75° N 168° W, 66° N 168° W, 48° N 160° E, 42° N 135° E, 50° N 130° E, 50° N 90° E, 35° N 70° E, 45° N 30° E, 60° N 20° E, pour rejoindre le point 76° N 32° E.

27/181B La *zone de réception NCA-MET* est délimitée par une ligne qui, partant du Pôle Nord, passe para les points 40° N 168° W, 30° N 140° E, 35° N 70° E, 30° N 20° E, pour rejoindre le Pôle Nord.

Zone VOLMET — PACIFIQUE:

(PAC-MET)

27/182 La *zone d'allotissement PAC-MET* est délimitée par une ligne qui, partant du point 52° N 132° E, passe par les points 63° N 149° W, 38° N 120° W, 50° S 120° W, 50° S 145° E, 28° S 145° E, 03° S 129° E, 22° N 112° E, pour rejoindre le point 52° N 132° E.

27/183 La *zone de réception PAC-MET* est délimitée par une ligne qui, partant du point 60° N 100° E, passe para les points 75°-N 160° W, 75° N 110° W, 65° S 110° W, 65° S 145° E, 28° S 145° E, 03° S 129° E, 05° N 80° E, 40° N 80° E, pour rejoindre le point 60° N 100° E.

Zone VOLMET — SUD-EST ASIATIQUE:

(SEA-MET)

27/184 La *zone d'allotissement SEA-MET* est délimitée par une ligne qui, partant du point 55° N 75° E, passe par les points 55° N 135° E, 45° N 135° E, 35° N 130° E, 10° N 130° E, 10° S 155° E, 35° S 155° E, 35° S 116° E, 08° N 75° E, 26° N 65° E, pour rejoindre de point 55° N 75° E.

27/185 La *zone de réception SEA-MET* est délimitée par une ligne qui, partant du point 55° N 50° E, passe par les points 55° N 180°, 50° S 180°, 50° S 70° E, 08° N 70° E, 08° N 50° E, pour rejoindre le point 55° N 50° E.

Zone VOLMET — CARAÏBES:

(CAR-MET)

27/185A La *zone d'allotissement CAR-MET* est délimitée par une ligne qui, partant du point 30° N 110° W, passe par les points 30° N 75° W, 00° 50° W, suit l'Équateur jusqu'au point 00° 80° W, pour rejoindre le point 30° N 110° W.

27/185B La *zone de réception CAR-MET* est délimitée par une ligne qui, partant du point 40° N 120° W, passe par les points 40° N 20° W, 25° S 20° W, 25° S 120° W, pour rejoindre le point 40° N 120° W.

Zone VOLMET — SUD AMÉRIQUE:

(SAM-MET)

27/185C La *zone d'allotissement SAM-MET* est délimitée par une ligne qui, partant du point 15° N 83° W, passe par les points 15° N 60° W, 05° S 35° W, 55° S 60° W, 55° S 83° W, pour rejoindre le point 15° N 83° W.

27/185D La *zone de réception SAM-MET* est délimitée par une ligne qui, partant du point 30° N 120° W, passe par le point 30° N 00°, le Pôle Sud, pour rejoindre le point 30° N 120° W.

ARTICLE 4

Zones mondiales d'allotissement

27/185E *Zone mondiale I:*

Les limites de cette zone d'allotissement correspondent à celles de l'ensemble des ZLARN 1, 2 et 3.

27/185F *Zone mondiale II:*

Les limites de cette zone d'allotissement correspondent à celles de l'ensemble des ZLARN 10, 11, 12A, 12B, 12C et 12D.

27/185G *Zone mondiale III:*

Les limites de cette zone d'allotissement correspondent à celles de l'ensemble des ZLARN 6, 8, 9 et 14.

27/185H *Zone mondiale IV:*

Les limites de cette zone d'allotissement correspondent à celles de l'ensemble des ZLARN 12E à 12J et la ZLARN 13.

27/185I *Zone mondiale V:*

Les limites de cette zone d'allotissement correspondent à celles de l'ensemble des ZLARN 4, 5 et 7.

SECTION II

Allotissement des fréquences dans le service mobile aéronautique (R)

ARTICLE 1

27/186 Plan d'allossement de fréquences par zones

Notes:

27/187 *a)* Le signe * indique une restriction dans l'emploi de la fréquence considérée, dont la signification est donnée dans la colonne 3 du Plan d'allotissement de fréquences par ordre numérique (numéros **27/195** à **27/207 A)**.

27/188 *b)* La liste suivant ne comprend pas les fréquences communes dans le monde entier aux services mobiles aéronautiques (R) et (OR), 3023 kHz et 5680 kHz. L'allotissement de ces fréquences est indique à l'article 2.

27/189

Zones Areas Zonas	Bandes de fréquences/Frequency bands/Bandas de frequências (MHz)

ARTICLE 2

Plan d'allotissement de fréquences (par ordre numérique)

Notes générales

27/192 1. *Classes des stations* — FA:

Classes d'émission: voir les numéros **27/49** à **27/52.**

Puissance: à moins d'indications contraires dans le Plan, la valeur des puissances des stations aéronautiques et des stations d'aéronef est celle qui figure aux numéros **27/54** à **27/62.**

Horaire: H24, à moins d'indications contraires.

27/193 2. Une fréquence allotie avec la mention «utilisation diurne» peut être utilisée pendant la période s'étendent de une heure après le lever du soleil jusqu'à une heure avant son coucher.

27/194 3. Une «voie commune» est une voie allotie en commun à deux zones ou plus sans tenir compte des conditions de brouillage réciproque; son emploi fait l'objet d'un accord entre les administrations intéressées.

27/194A 4. A l'exception des fréquences porteuses (fréquences de référence) 3023 kHz et 5680 kHz, les fréquences utilisables dans le monde entier et spécifiées dans les tableaux figurant au numéro **27/189** et aux numéros **27/195** à **27/207A** sont réservées aux assignations faites par les administrations à des stations desservant un ou plusieurs exploitants d'aéronefs, selon les droits conférés par l'administration intéressée. Ces assignations ont pour objet l'établissement de communications entre une station aéronautique appropriée et une station d'aéronef, quel que soit le point du monde où elle se trouve, afin de contrôler la régularité du vol et de veiller à la sécurité de l'aéronef. Les fréquences utilisables dans le monde entier ne doivent pas être assignées par les administrations pour les ZLAMP, ZLARN ou zones VOLMET. Lorsqu'une zone d'exploitation est entièrement comprise dans les limites de ZLARN ou de subdivision de ZLARN, les fréquences à utiliser sont les fréquences allotiès aux ZLARN et aux subdivisions de ZLARN.

Explation of symbols and abbreviations

Colomn 2 M = MWARA.
R = RDARA.
V = VOLMET.
W = worldwide.

Colomn 3 CC = common channel to.
C001/... Restricted do daytime only, in the area indicated after the slant stroke.
C002/6G In area 6G, operation is resctricted to east of 95° E.
C003/6G In area 6G, operation is resctricted to west of 95° E.
C004/6G Use limited to east of 110° E.
C005/2A Use limited to north of 60° N.
C006/6A Use limited to east of 75° E.
C007 Not used.
C008 Not used.

C009/6G In area 6G, use limited to east of 110° E and south of 25° N.
C010/6G In area 6G, use limited to east of 118° E and north of 40° N.
C011/6E In area 6E, use is limited to south of 20° N.
C100/... Worldwide Allotment Area is indicated after the symbol. For assignment procedure see No **27/194A**.

Explicación de los símbolos y abreviaturas

Colomna 2 M = ZRMP.
R = ZRRN.
V = VOLMET.
W = mundial.
Colomna 3 CC = canal común a.
C001/... En la zona indicada después del trazo oblicuo, utilización diurna.
C002/6G En la zona 6G, el funcinamiento está limitado al este de 95° E.
C003/6G En la zona 6G, el funcionamiento está limitado al oeste de 95° E.
C004/6G Uso limitado al este de 110° E.
C005/2A Uso limitado al norte de 60° N.
C006/6A Uso limitado al este de 75° E.
C007 No ha sido utilizado.
C008 No ha sido utilizado.
C009/6G En la zona 6G, el funcionamiento está limitado al este de 110° E y al sur de 25° N.
C010/6G En la zona 6G, el funcionamiento está limitado al est de 118.° E y al norte de 40° N.
C011/6E En la zona 6E, uso limitado al sur de 20° N.
C100/... Se indica la zona de ajudicación para utilización mundial después del símbolo. En lo que se refiere al procedimiento para la asignación de las frecuencias véase el numéro **27/194A**.

ARTICLE 3

Fréquences pour utilisation commune

27/208 1. Les fréquences porteuses (fréquences de réference) 3023 kHz et 5680 kHz sont destinées à l'utilisation commune dans le monde entier.

27/209 2. L'utilisation de ces fréquences dans le monde entier esta autorisée:

2.1. Dans les stations d'aéronef, pour:

a) Les contrôles d'approche et d'aérodrome;
b) Les communications avec les stations aéronautiques iorsque les autres fréquences de ces stations sont indisponibles ou inconnues;

2.2. Dans les stations aéronautiques, pour les contrôles d'approche et d'aérodrome avec les réserves suivantes:

a) Avec une puisssance moyenne limitée à une valeur au plus égale à 20 watts dans le circuit d'antenne;
b) Dans chaque cas, on doit étudier tout spécialment le type d'antenne à utiliser pour éviter les brouillages nuisibles;
c) La puissance des stations aéronautiques qui utilisent ces fréquences dans les conditions ci-dessus augmentée jusqu'à la valeur nécessaire pour satisfaire certains besoins d'exploitation, sous réserve de coordination entre les administrations directement intéressés et celles dont les services peuvent être défavorablement influencés.

27/210 3. Nonobstant les disposition qui précèdent, la fréquence 5680 kHz peut également être utilisé dans les stations aéronautiques pour les communications avec des stations d'aéronef lorsque les autres fréquences des stations aéronautiques sont indisponibles ou inconnues. Cette utilisation est cependant limitée à des zones et soumise à des conditions telles qu'il ne puisse en résulter aucun brouillage nuisible aux autres communications autorisées du service mobile aéronautique.

27/211 4. Des détails supplémentaires concernant l'utilisation de ces voies pour les fins susmentionnées peuvent être recommandés par les réunions de l'OACI.

27/212 5. Les fréquences 3023 kHz et 5680 kHz peuvent également être utilisées par des stations d'autres services mobiles qui participent à des opérations de recherche et de sauvetage coordonées, aériennes et de surface, ainsi que pour des communications entre ces satations et les stations terrestres participantes. Les stations aéronautiques sont autorisées á utiliser ces fréquences pour établir des communications avec de telles stations.

27/213 6. Ces voies peuvent être utilisées pour les émissions de classe A1 ou A3, conformément à des accords particuliers. Elles ne doivent pas être subdivisées.

27/214 7. Toutes les stations qui participent directement à des opérations de recherche et de sauvetage coordonnées et qui utilisent les fréquences 3023 kHz et 5680 kHz doivent émettre uniquement dans la bande latérale supérieure, à l'exception des cas prévus au numéro **27/50**.

INDEX ANALYTIQUE

Résolutions et recommandations

Cet index analytique comprend deux parties:

PARTIE A — Résolutions;
PARTIE B — Recommandations.

Chaque partie contient deux sections:

Section I — liste des résolutions et recommandations dans l'ordre numérique avec indication des sujets (mots-clés) répertoriés dans la section II. Les sujets principaux figurant en majuscules sont les titres sous lesquels on trouvera les textes explicatifs des résolutions ou recommandations. Ceux qui figurent en minuscules renvoient à un ou plusieurs sujets principaux;
Section II — liste des résolutions/recommandations groupées par sujet (mots-clés), dans l'ordre alphabétique.

PARTIE A

Résolutions

SECTION I

Sujets de l'index analytique (mots-clés)

Résolution N° 1 — Notification des assignations de fréquence:

Gestion des fréquences;
Règlement des radiocommunications.

Résolution N° 2 — Orbite des satellites geostationnaires. Services spatiaux:

Fichier de référence international des fréquences (FRIF);
Union Internationale des Télécommunications (IFRB).

Résolution N° 3 — Orbite des satellites geostationnaires:

Conférences administratives;
Union Internationale des Télécommunications (CCIR, conseil d'administration, IFRB).

Résolution N° 4 — Orbite des satellites geostationnaires:

Conférences administratives;
Fichier de référence internationale des fréquences (FRIF);
Règlement des radiocommunications.
Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 5 — Propagation — cooperation technique:

Organisations internationales (UAPT, UPAT, URTNA);
Union Internationale des Télécommunications (CCIR, conférences administratives, conseil d'administration, secrétaire général).

Résolution N° 6 — Règlement des radiocommunications:

Gestion des fréquences;
Union Internationale des Télécommunications (IFRB, secrétaire général).

Résolution N° 7 — Gestion des fréquences — cooperation technique:

Conférences administratives;
Union Internationale des Télécommunications (CCIR, conférence de plénipotentiaires, conseil d'administration, IFRB, secrétaire général).

Résolution N° 8 — Attribution des bandes de fréquence — service fixe:

Règlement des Radiocommunications;
Service mobiles;
Union Internationale des Télécommunications (IFRB).

Résolution N° 9 — Service fixe:

Fichier de référence international des fréquences (FRIF);
Union Internationale des Télécommunications (IFRB).

Résolution N° 10 — Operations/organisations de secours:

Attribution de bandes de fréquence.

Résolution N° 11 — Navires et aeronefs non parties a un conflit arme:

Organisations internationales (OACI, OMCI);
Service mobile aéronautique (R);
Service mobile maritime;
Union Internationale des Télécommunications (conférences administratives, conseil d'administration, secrétaire général).

Résolution N° 12 — Identification des stations:

Règlement des radiocommunications;
Union Internationale des Télécommunications (conférences administratives, secrétaire général).
Secrétaire général.

Résolution N° 13 — Identification des stations:

Union Internationale des Télécommunications (conférences administratives, secrétaire général).

Résolution N° 14 — Cooperation technique:

Organisations internationales (ONU);
Union Internationale des Télécommunications (conférences administratives, conseil d'administration, secrétaire général).

Résolution N° 15 — Services statiaux — cooperation technique:

Union Internationale des Télécommunications (conférences administratives, conseil d'administration).

Résolution N° 16 — Cooperation technique:

Organisations internationales (ONU);
Union Internationale des Télécommunications (CCIR, CCITT, conférences administratives, conseil d'administration, secrétaire général).

Résolution N° 17 — Conferences administratives:

Union Internationale des Télécommunications (CCIR, conseil d'administration, IFRB, secrétaire général).

Résolution N° 30 — Fichier de référence international des fréquences (FRIF):

Union Internationale des Télécommunications (IFRB).

Résolution N° 31 — Service de radiodiffusion par satellite — service fixe par satellite:

Fichier de référence international des fréquences (FRIF);
Règlement des Radiocommunications;
Services de Terre;
Services mobiles;
Union Internationale des Télécommunications (CCIR).

Résolution N° 32 — Services spatiaux:

Fichier de référence international des fréquences (FRIF);
Services de Terre;
Services mobiles;
Union Internationale des Télécommunications (IFRB).

Résolution N° 33 — Service de radiodiffusion par satellite:

Fichier de référence international des fréquences (FRIF);
Règlement des Radiocommunications;
Services de Terre;
Services spatiaux;
Union Internationale des Télécommunications (IFRB).

Résolution N° 34 — Service de radiodiffusion par satellite:

Règlement des Radiocommunications;
Services de Terre;
Services spatiaux;
Union Internationale des Télécommunications (CCIR).

Résolution N° 35 — Gestion des fréquences:

Règlement des Radiocommunications;
Union Internationale des Télécommunications (CCIR, IFRB).

Résolution N° 36 — Emissions — Fichier de référence international des fréquences (FRIF):

Gestion des fréquences;
Union Internationale des Télécommunications (IFRB).

Résolution N° 37 — Gestion des fréquences — cooperation technique:

Union Internationale des Télécommunications (conseil d'administration, secrétaire général);
Utilisation des techniques informatiques.

Résolution N° 38 — Service fixe:

Service mobiles;
Services de radiorepérage;
Union Internationale des Télécommunications (conférences administratives, IFRB);

Résolution N° 60 — Propagation:

Conférences administratives;
Union Internationale des Télécommunications (CCIR, conférences administratives, conseil d'administration, secrétaire général);

Résolution N° 61 — Division du monde — propagation:

Union Internationale des Télécommunications (CCIR).

Résolution N° 62 — Ionosphere.

Résolution N° 63 — Equipement:

Conférences administratives;
Organisations internationales (CEI, CISPR);
Union Internationale des Télécommunications (CCIR, conférence administratives).

Résolution N° 64 — Equipement:

Union Internationale des Télécommunications (CCIR, CCITT).

Résolution N° 65 — Règlement des radiocommunications:

Union Internationale des Télécommunications (CCIR, secrétaire général).

Résolution N° 66 — Division du monde — attribution de bandes de fréquences:

Union Internationale des Télécommunications (CCIR, conseil d'administration).

Résolution N° 67 — Equipement:

Résolution N° 68 — Conferences administratives — terminologie:

Règlement des radiocommunications;
Union Internationale des Télécommunications (CCIR, CCITT, conférence administratives, conférences de plénipotentiaires, secrétaire général).

Résolution N° 100 — Service fixe par satellite:

Fichier de référence international des fréquences (FRIF);
Service de radiodiffusion par satellite;
Union Internationale des Télécommunications (IFRB).

Résolution N° 101 — Service fixe par satellite:

Conférences administratives;
Liaisons de connexion;
Service de radiodiffusion par satellite;
Union Internationale des Télécommunications (CCIR, conseil d'administration).

Résolution N° 102 — Service fixe par satellite:

Liaisons de connexion;
Service de radiodiffusion par satellite;
Union Internationale des Télécommunications (IFRB).

Résolution N° 103 — Service fixe:

Coopération technique;
Règlement des Radiocommunications;
Union Internationale des Télécommunications (IFRB).

Résolution N° 200 — Détresse et sécurité:

Organisations internationales (OMCI);
Service mobile maritime;
Services mobiles;
Union Internationale des Télécommunications (CCIR, conférences administratives, secrétaire général).

Résolution N° 201 — Correspondance publique:

Service mobile maritime;
Services mobiles;
Union Internationale des Télécommunications (CCITT, conférences administratives).

Résolution N° 202 — Services mobiles:

Conférences administratives;
Union Internationale des Télécommunications (CCIR, conseil d'administration, IFRB).

Résolution N° 300 — Service mobile maritime:

Conférences administratives;
Fichier de référence international des fréquences (FRIF);
Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 301 — Service mobile maritime:

Fichier de référence international des fréquences (FRIF);
Conférences administratives;
Union Internationale des Télécommunications (IFRB).

Résolution N° 302 — Service mobile maritime:

Fichier de référence international des fréquences (FRIF);
Océanographie;
Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 303 — Service mobile maritime:

Fréquences navire-navire;
Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 304 — Service mobile maritime:

Disposition des voies;
Union Internationale des Télécommunications (conférences administratives).

Résolution N° 305 — Détresse et sécurité:

Conférences administratives;
Organisations internationales (OMCI);
Service mobile maritime;
Services mobiles;
Union Internationale des Télécommunications (conférences administratives, secrétaire général).

Résolution N° 306 — Service mobile maritime:

Emissions;
Techniques de la bande latérale unique;
Union Internationale des Télécommunications (conférences administratives).

Résolution N° 307 — Service mobile maritime:

Emissions;
Techniques de la bande latérale unique;
Union Internationale des Télécommunications (conférences administratives).

Résolution N° 308 — Service mobile maritime:

Disposition des voies;
Union Internationale des Télécommunications (conférences administratives).

Résolution N° 309 — Détresse et sécurité — service mobile maritime:

Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 310 — Service mobile maritime:

Conférences administratives;
Organisations internationales (OMCI);
Union Internationale des Télécommunications (CCIR, conférences administratives, secrétaire général).

Résolution N° 311 — Service mobile maritime:

Union Internationale des Télécommunications (CCIR, conférences administratives, secrétaire général).

Résolution N° 312 — Service mobile maritime:

Union Internationale des Télécommunications (conférences administratives, secrétaire général).

Résolution N° 313 — Identification des stations:

Service mobile maritime;
Service mobile maritime par satellite;
Union Internationale des Télécommunications (CCIR, CCITT, conférences administratives, secrétaire général).

Résolution N° 314 — Service mobile maritime:

Conférences administratives;
Océanographie;
Organisations internationales (COI, OMM);
Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 315 — Service mobile maritime:

Correspondance publique;
Union Internationale des Télécommunications (conférences administratives).

Résolution N° 316 — Cooperation technique:

Organisations internationales (CNUCED, OMCI, PNUD);
Service mobile maritime;
Union Internationale des Télécommunications (conférences administratives, secrétaire général).

Résolution N° 400 — Service mobile aeronautique (R):

Fichier de référence international des fréquences (FRIF);
Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 401 — Service mobile aeronautique (R):

Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 402 — Service mobile aeronautique (R):

Emissions;
Règlement des Radiocommunications;
Techniques de la bande latérale unique;
Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 403 — Service mobile aeronautique (R) — service mobile aeronautique (OR):

Recherche et sauvetage;
Union Internationale des Télécommunications (conférences administratives).

Résolution N° 404 — Service mobile aeronautique (R):

Fichier de référence international des fréquences (FRIF);
Union Internationale des Télécommunications (conférences administratives, IFRB, secrétaire général).

Résolution N° 405 — Service mobile aeronautique (R):

Union Internationale des Télécommunications (conférences administratives).

Résolution N° 405 — Service mobile aeronautique (R):

Union Internationale des Télécommunications (conférences administratives).

Résolution N° 406 — Service mobile aeronautique (R) — service mobile aeronautique par satellite:

Diffusion de renseignements météorologiques;
Union Internationale des Télécommunications (conférences administratives).

Résolution N° 407 — Service mobile aeronautique (R):

Détresse et sécurité (contrôle des émissions);
Union Internationale des Télécommunications (conférences administratives, IFRB).

Résolution N° 500 — Service de radiodiffusion:

Organisations internationales (OACI);
Règlement des Radiocommunications;
Union Internationale des Télécommunications (IFRB, secrétaire général).

Résolution N° 501 — Service de radiodiffusion:

Union Internationale des Télécommunications (IFRB).

Résolution N° 502 — Service de radiodiffusion par satellite:

Règlement des Radiocommunications;
Union Internationale des Télécommunications (IFRB, secrétaire général).

Résolution N° 503 — Service de radiodiffusion par satellite:

Fichier de référence international des fréquences (FRIF);
Règlement des Radiocommunications;
Service fixe par satellite;
Services spatiaux;
Union Internationale des Télécommunications (IFRB).

Résolution N° 504 — Service de radiodiffusion par satellite:

Conférences administratives;
Règlement des Radiocommunications;

Résolution N° 505 — Service de radiodiffusion par satellite:

Conférences administratives;
Union Internationale des Télécommunications (CCIR).

Résolution N° 506 — Service de radiodiffusion par satellite — Orbite des satelites geostationnaires:

Services spatiaux;

Résolution N° 507 — Service de radiodiffusion par satellite:

Conférences administratives;
Règlement des Radiocommunications;
Union Internationale des Télécommunications (conseil d'administration, IFRB).

Résolution N° 508 — Service de radiodiffusion:

Conférences administratives;
Règlement des Radiocommunications;
Techniques de la bande latérale unique;
Union Internationale des Télécommunications (CCIR, conseil d'administration, IFRB).

Résolution N° 509 — Service de radiodiffusion:

Conférences administratives;
Union Internationale des Télécommunications (CCIR, conseil d'administration, IFRB).

Résolution N° 510 — Services de radiodiffusion:

Conférences administratives;
Union Internationale des Télécommunications (CCIR, conseil d'administration).

Résolution N° 600 — Services de radiorepérage:

Conférences administratives;
Organisations internationales (OACI, OMCI);
Service mobile aéronautique (R);
Service mobile maritime;
Union Internationale des Télécommunications (CCIR, conseil d'administration, secrétaire général).

Résolution Nº 601 — Radiobalises de localisation des sinistres:

Organisations internationales (OACI);
Recherche et sauvetage;
Service mobile aéronautique (R);
Service mobile maritime;
Union Internationale des Télécommunications (CCIR, conférences administratives).

Résolution Nº 640 — Service d'amateur:

Catastrophe naturelle;
Secours.

Résolution Nº 641 — Service d'amateur — service de radiodiffusion.

Résolution Nº 642 — Service d'amateur par satellite:

Union Internationale des Télécommunications (IFRB).

Résolution Nº 700 — Service de radiodiffusion par satellite — service fixe par satellite:

Conférences administratives;
Règlement des Radiocommunications;
Union Internationale des Télécommunications (CCIR).

Résolution Nº 701 — Service de radiodiffusion par satellite — service fixe par satellite:

Conférences administratives;
Liaisons de connexion;
Union Internationale des Télécommunications (CCIR, conseil d'administration, IFRB, secrétaire général).

Résolution Nº 702 — Service de radiodiffusion par satellite — service fixe — services mobiles:

Union Internationale des Télécommunications (CCIR, secrétaire général).

Résolution Nº 703 — Services spatiaux:

Services de Terre;
Union Internationale des Télécommunications (CCIR, IFRB, secrétaire général).

Section II

Attribution de bandes de fréquences:

Elimination des services fixe et mobile de certaines bandes de fréquences comprises entre 4000 kHz et 27 000 kHz et procédure de transition pour le choix et l'approbation d'assignations de remplacement (Résolution Nº 8).
Révision de la division du monde en régions aux fins de l'attribution de bandes de fréquences (Résolution Nº 66).

Communications en cas de catastrophe naturelle:

Voir *Service d'amateur* (Résolution Nº 640).

Conférences administratives:

Conférence de plénipotentiaires, mesures à prendre par (Résolutions Nºs 7 et 68).
Détermination de la structure des comissions qui pourront être établies en fonction de l'ordre du jour (Résolution Nº 17).
Autres Résolutions concernant les conférences:

Voir *Détresse et sécurié* (Résolution Nº 305).
Voir *Equipement* (Résolution Nº 63).
Voir *Orbite des satellites géostationnaires* (Résolutions Nºs 3 et 4).
Voir *Propagation* (Résolution Nº 60).
Voir *Service de radiodiffusion* (Résolutions Nºs 508, 509, 510 et 702).
Voir *Service de radiodiffusion par satellite* (Résolutions Nºs 504, 505, 507, 700 et 701).
Voir *Service fixe par satellite* (Résolution Nº 101).
Voir *Service mobile maritime* (Résolutions Nºs 300, 301, 310 et 314).
Voir *Service de radiorepérage* (Résolution Nº 600).
Voir *Services mobiles* (Résolution Nº 202).

Cooperation et assistance technique:

Assistance dans le domaine des radiocommunications spatiales (Résolution Nº 15).
Assistance en matière d'utilisation des techniques informatiques pour la gestion du spectre radioélectrique (Résolution Nº 37).
Coopération dans le domaine des télécommunications maritimes (Résolution Nº 316).
Études de propagation en régions tropicales (Résolution Nº 5).
Mise en oeuvre d'une gestion nationale des fréquences radioélectriques (Résolution Nº 7).
Rôle des télécommunications dans le développement rural intégré (Résolution Nº 16).
Transfert de technologie dans le domaine des télécommunications (Résolution Nº 14).
Voir aussi *Service fixe* (Résolution nº 103).

Correspondance publique:

Dispositions d'exploitation à la taxation et à la comptabilité de la correspondance publique dans le service mobile (Résolution nº 201).
Voir aussi *Service mobile maritime* (Résolution Nº 315).

Détresse et sécurité:

Contrôle des émissions:

Utilisation non autorisée des fréquences des bandes attribuées au service mobile maritime (Résolution Nº 309).
Voir aussi *Service mobile aéronautique* (R) (Résolution Nº 407).

Utilisation des classes d'émission R3E et J3E (*a*):

Sur la fréquence porteuse 2182 kHz (Résolution Nº 200).
Sur les fréquences porteuses 4125 kHz et 6215,5 kHz (Résolution Nº 305).

Voir aussi *Service mobile aéronautique* (R) (Résolution Nº 403).

Diffusion de renseignements météorologiques:

Voir *Service mobile aéronautique* (R) (Résolution Nº 406).

Dispositions des voies:

Voir *Service mobile maritime* (Résolutions Nºs 304 et 308).

Division du monde:

En zones climatiques pour le calcul des caractéristiques de propagation (Résolution Nº 61).
Révisions de la division du monde en régions aux fins d'attribution des bandes de fréquences (Résolution Nº 66).

Émissions:

Établissement par l'IFRB d'une documentation explicative au sujet de l'application de la nouvelle méthode de désignation des émissions (Résolution Nº 36).
Voir aussi *Service mobile aéronautique* (R) (Résolution Nº 402).
Voir aussi *Service mobile maritime* (Résolutions Nºs 306 et 307).

Equipement:

ISM:

Protection des services de radiocommunication contre les brouillages causés par les appareils ISM (Résolution Nº 63).

Radioélectriques:

Perfectionnement de la conception des (Résolution Nº 67).
Protection contre le foudre des (Résolution Nº 64).

Fichier de référence international des fréquences (FRIP):

Etablissement par l'IFRB d'une documentation explicative sur la nouvelle méthode de désignation des émissions (Résolution Nº 36).
Révision d'inscriptions à la demande de conférences antérieures (Résolution Nº 30).
Voir aussi *Orbite des satellites géostationnaires* (Résolutions Nºs 2 et 4).
Voir aussi *Service de radiodiffusion par satellite* (Résolutions Nºs 31, 33 et 503).
Voir aussi *Service fixe* (Résolution Nº 9).
Voir aussi *Service fixe par satellite* (Résolution Nº 100).
Voir aussi *Service mobile aéronautique (R)* (Résolutions Nºs 400, 401 et 404).
Voir aussi *Service mobile maritime* (Résolutions Nºs 300, 301 et 302).
Voir aussi *Service spatiaux* (Résolution Nº 32).

Fréquences navire-navire:

Voir *Service mobile maritime* (Résolution Nº 303).

Gestion des fréquences:

Assistance relative à l'utilisation des techniques informatiques pour la (Résolution Nº 37).
Mise en œuvre d'une gestion nationale des fréquences radioélectriques (Résolution Nº 7).
Procédure à suivre pour mettre fin à un désaccord au sujet des Normes techniques ou des Règles de procédure de l'IFRB (Résolution Nº 35).
Voir aussi *Coopération technique* (Résolution Nº 7).
Voir aussi *Émissions* (Résolution Nº 36).
Voir aussi *Notification des assignations des fréquence* (Résolution Nº 1).
Voir aussi *Règlement des radicommunications* (Résolution Nº 6).

Identification des stations:

Indicatifs d'appel:

Nouvelles Règles de formation des (Résolution Nº 12).
Possibilité de former de nouvelles séries d'indicatifs d'appel (Résolution Nº 13).

Introduction d'un nouveau système d'identification des stations du service mobile maritime et du service mobile maritime par satellite (identités dans le service mobile maritime) (Résolution Nº 313).
Voir aussi *Service mobile maritime* (Résolution Nº 311).

Liaison de connexion:

Voir *Service fixe par satellite* (Résolutions Nºs 101, 102 et 701).

(*a*) Précédemment A3A et A3J.

Navires et aéronefs non parties a un conflit arme:

Utilisation des radiocommunications pour la sécurité, l'identification et la localisation des (Résolution N° 11).

Notification des assignations de fréquence (généralites):

A faire par l'administration du pays sur le territoire duquel la station est située (Résolution N° 1).

Oceanographie:

Voir aussi *Service mobile maritime* (Résolutions N°s 302 et 314).

Operations organisations de secours:

Assignations de fréquence pour les (Résolution N° 10).
Voir aussi *Service d'amateur* (Résolution N° 640).

Orbite des satellites géostationnaires:

Durée de validité des assignations de fréquences aux stations spatiales utilisant l'—— (Résolution N° 4).
Utilisation de l'——, à exclusion de toute autre orbite, par les stations spatiales fonctionnant dans les bandes de fréquences de 12 GHz attribuées au service de radiodiffusion par satellite (Résolution N° 506).
Utilisation de l'—— et planification des service spatiaux utilisant cette orbite (Résolution N° 3).
Utilisation equitable par tous les pays, avec égalité de droits, de l'—— et des bandes de fréquences attribuées aux services de radiocommunication spatiale (Résolution N° 2).

Organisations internationales:

Résolutions présentant un intérêt pour les organisations suivantes:

Commission électrotechnique internationale (CEI):

Voir *Equipement* (Résolution N° 63).

Comission océanographique intergouvernementale (COI):

Voir *Service mobile maritime* (Résolution N° 314).

Comité international spécial des perturbations radioélectriques (CISPR):

Voir *Equipement* (Résolution N° 63).

Conférence des Nations Unies pour le commerce et le développement (CNUCED):

Voir *Coopération technique* (Résolution N° 316).

Organisation de l'aviation civile internationale (OACI):

Voir *Navires et aéronefs non parties à un conflit armé* (Résolution N° 11).
Voir *Radiobalises de localisation des sinistres* (Résolution N° 601).
Voir *Service de radiodiffusion* (Résolution N° 500).
Voir *Service de radiorepérage* (Résolution N° 600).

Organisation des Nations Unies (ONU):

Voir *Coopération technique* (Résolutions N°s 14 et 16).

Organisation intergouvernementale consultative de la navigation maritime (OMCI):

Voir *Coopération technique* (Résolution N° 316).
Voir *Détresse et sécurité* (Résolutions N°s 200 et 305).
Voir *Navires et aéronefs non parties à un conflit armé* (Résolution N° 11).
Voir *Radiobalises de localisation des sinistres* (Résolution N° 601).
Voir *Service mobile maritime* (Résolution N° 310).
Voir *Service de radiorepérage* (Résolution N° 600).

Organisation météorologique mondiale (OMM):

Voir *Service mobile maritime* (Résolution N° 314).

Organisations régionales:

Union Africaine des Postes et Télécommunications(UAPT), Union des Radiodiffusion et Télévision Nationales d'Afrique (URTNA), Union Panafricaine des Télécommunications (UAPT) et autres:

Voir *Cooperátion technique* (Résolution N° 5).

Programme des Nations Unies pour le développement (PNUD):

Voir *Coopération technique* (Résolution N° 316)

Propagation:

Coopération technique avec les pays en développement dans le domaine des études de propagation en régions tropicales (Résolution N° 5).
Divison du monde en zones climatiques pour le calcul des caractéristiques de propagation (Résolution N° 61).
Renseignements sur la propagation des ondes radioélectriques utilisés pour déterminer la zone de coordination (Résolution N° 60).

Radiobalises de localisation des sinistres:

Les radiobalises de localisation des sinistres qui fonctionnent sur la fréquence 121,5 MHz ou sur la fréquence 243 MHz, ou sur ces deux fréquences, doivent êre conformes aux Normes et aux Avis de l'OACI et du CCIR (Résolution N° 601).

Recherche et sauvetage:

Voir *Radiobalises de localisation des sinistres* (Résolution Nº 601).
Voir *Services mobiles aéronautiques (R) et (OR)* (Résolution Nº 403).

Recherche ionosphérique:

Utilisation expérimentale des ondes radioélectriques par les satellites de recherche ionosphérique (Résolution Nº 62).

Règlement des Radiocommunications:

Identification des dispositions conteant une référence à des Avis du CCIR (Résolution Nº 65).
Manuel destiné à expliquer et à illustrer les procédures du chapitre IV du Réglement des Radiocommunications (Résolution Nº 6).
Voir aussi *Attribution des bandes de fréquences* (Résolution Nº 8).
Voir aussi *Gestion des fréquences* (Résolution Nº 35).
Voir aussi *Identification des stations* (Résolution Nº 12).
Voir aussi *Notification des assignations de fréquence* (Résolution Nº 1).
Voir aussi *Orbite des satellites géostationnaires* (Résolution Nº 4).
Voir aussi *Service de radiodiffusion* (Résolutions Nºs 500 et 508).
Voir aussi *Service de radiodiffusion par satellite* (Résolutions Nºs 31, 33, 34, 502, 503, 504 et 507).
Voir aussi *Service fixe* (Résolution Nº 700).
Voir aussi *Service mobile aéronautique (R)* (Résolutions Nºs 402 et 403).
Voir aussi *Terminologie* (Résolution Nº 68).

Service d'amateur:

Interdiction aux stations de radiodiffusion d'émettre sur des fréquences de la bande 700-7100 kHz réservée au service d'amateur (Résolution Nº 641).
Utilisation des bandes attribuées au service d'amateur aux fins de communications internationales en cas de catastrophes naturelles (Résolution Nº 640).

Service d'amateur par satellite:

Communication à l'IFRB des informations à la mise en service des stations terriennes du service d'amateur par satellite (Résolution Nº 642).

Service de radiodiffusion:

Convocation de conférences:

Définition des critères de partage pour l'utilisation des bandes des ondes métriques e décimétriques attribuées aux service fixe, de radiodiffusion et mobile dans la Région 3 (Résolution Nº 702).
Planification de la radiodiffusion sonore dans la bande 87,5-108 MHz pour la Région 1 et certains pays concernés de la Région 3 (Résolution Nº 510).
Planification des bandes d'ondes décamétriques (Résolution Nº 508).
Réexamen et révision des dispositions des Actes finals de Conférence africaine de radiodiffusion sur ondes métriques et décimétriques (Génève, 1963) (Résolution Nº 509).

Examen par l'IFRB des fiches de notification concernant les stations du service de radiodiffusion de la Région 2 travaillant dans la bande 535-1605 kHz (Résolution Nº 501).
Interdiction d'utiliser la bande 700-7100 khz réservée au service d'amateur (Résolution Nº 641).
Modification des fréquences porteuses des stations de radiodiffusion à ondes kilométriques dans la Région 1 (Résolution Nº 500).

Service de radiodiffusion par satellite:

Convocation de conférences:

Etablissement d'accords et de plans associés (Résolution Nº 507).
Planification dans la bande des 12 GHz et les liaisons de connexion associées, dans la Région 2 (Résolution Nº 701).

Procédures à appliquer avant l'entrée en vigur des accords et des plans:

Application de certaines dispositions des Actes finals de la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) pour tenir compte des modifications aportées par la CAMR-1959 au Tableau d'attribution des bandes de fréquences pour la Région 2, dans la bande 1,7-12,7 GHz (Résolution Nº 31).
Coodination, notification et inscription dans le Fichier de référence international des fréquences des assignations de fréquence aux stations de la Région 2 (Résolution Nº 503).
Etablissement de services de radiodiffusion par satellite dans la bande 12,5-12,75 GHz et partage avec les services spatiaux et de Terre dans la Région 1, 2 et 3 (Résolution Nº 34).
Expériences et études relatives au service de radiodiffusion par satellite (radiodiffusion sonore) dans la gamme de fréquences de 0,5 GHz à 2 GHz (Résolution Nº 505).
Mise en service de stations spatiales du service de radiodiffusion par satellite; procédures de coordination entre les stations spatiales de ce service et les stations de terre et les systèmes spatiaux relevant d'autres administrations; notification, examen et inscription dans le FRIP des assignations aux stations spatiales du service de radiodiffusion par satellite (Résolution Nº 33).
Procédures intérimaires à appliquer jusqu'à l'insertion en annexe au Réglement des radiocommunications du plan et des dispositions adoptées par la Conférence administrative mondiale des radiocommunications pour la radiodiffusion par satellite (Génève, 1977) (Résolution Nº 502).
Procédure intérimaire relative à la bande 11,7-12,2 GHz dans la Région 2 (Résolution Nº 504).
Partage entre le service fixe par satellite dans les Régions 1 et 3 et le service de radiodiffusion par satellite dans la Région 2, dans la bande 12,2-12,7 GHz (Résolution Nº 700).

Utilisation de l'orbite des satellites géostationnaires, à l'exclusion de toute autre orbite, par les stations spatiales fonctionnant dans les bandes de fréquences de 12 GHz attribuées au service de radiodiffusion par satellite (Résolution Nº 506).
Voir aussi *Service fixe par satellite* (Résolutions Nºs 100, 101 et 102).

Service fixe:

Assistance aux pays en développement pour assurer l'accès de leurs service fixes aux bandes des ondes décamétriques (Résolution Nº 103).
Convocation de conférences pour définir des critères de partage pour l'utilisation des bandes des ondes métriques et décimétriques attribuées au service fixe (et aux services de radiodiffusion et mobile) dans la Région 3 (Résolution Nº 702).
Réassignation des fréquences aux stations des services fixe et mobile fonctionnant dans certaines bandes attribuées aux services de radiolocalisation et d'amateur dans la Région 1 (Résolution Nº 38).
Retrait des service fixe et mobile de certaines bandes comprises entre 4000 kHz et 27 500 kHz et procédure de transition relative au choix et à l'approbation des assignations de remplacement (Résolution Nº 8).
Révision des inscriptions dans le FRIP dans les bandes attribuées au service fixe entre 3000 kHz et 27 500 kHz (Résolution Nº 9).
Voir aussi *Service fixe par satellite* (Résolution Nº 31).

Service fixe par satellite:

Application de certaines dispositions des Actes finals de la Conférence mondiale pour la radiodiffusion par satellite, 1977, pour tenir compte des modifications apportés par la CAMR-79 au Tableau d'attribution des bandes de fréquences pour la Région 2, dans la bande 11,7-12,7 GHZ (Résolution Nº 31).
Conclusion d'accords et établissement des plans associés pour des liaisons de connexion aux stations du service de radiodiffusion par satellite fonctionnant dans la bande des 12 GHz (Résolution Nº 101).
Convocation d'une conférence chargée d'établir un plan pour le service de radiodiffusion par satellite dans la bande des 12 GHz et des liaisons de connexion associés dans la Région 2 (Résolution Nº 701).
Coordination des caractéristiques techniques des liaisons de connexion aux stations spatiales du service de radiodiffusion par satellite de la bande 11,7-12,5 GHz (Région 1) et 11,7-12,2 GHz (Région 3) pour la période de transition (Résolution Nº 102).
Coodination, notification et inscription dans le FRIP des assignations á des stations du service fixe par satellite, à l'égard des stations du service de radiodiffusion par satellite dans la Région 2 (Résolution Nº 100).
Partage entre le service fixe par satellite dans les Régions 1 et 3 le service de radiodiffusion par satellite dans la Région 2, dans la bande 12,2-12,7 GHz (Résolution Nº 700).
Voir aussi *Service de radiodiffusion par satellite* (Résolution Nº 503).

Service mobile aéronautique (OR):

Utilisation des fréquences 3023 kHz et 5680 kHz:

En commun par les services mobiles aéronautiques (R) et (OR) (Résolution Nº 403).

Service mobile aéronautique par satellite:

Bandes de fréquences supérieures aux bandes d'ondes décamétriques:

Utilisation pour les communications et la diffusion de renseignements météorologiques dans le service mobile aéronautique (R) et service aéronautique par satellite (Résolution Nº 406).

Service mobile aéronautique (R):

Bandes de fréquences attribués en exclusivité au service mobile aéronautique (R) entre 2850 kHz et 22 000 kHz:

Traitement des fiches de notification concernant les assignations de fréquences (Résolution Nº 400).
Mise en œuvre du Plan d'allotissemnt de fréquences de l'Appendice 27 Aer2 (Résolution Nº 401).
Mise en œuvre du nouvel arrangement apllicable à ces bandes de passage de l'exploitation en DBL à l'exploitation en BLU (Résolution Nº 402).

Bandes de fréquences attribuées en exclusivité au service mobile aéronautique (R) entre 21 924 kHz et 22 000 kHz:

Mise en œuvre de la nouvelle disposition (addition à l'appendice 27 Aer2) (Résolution Nº 404).

Bandes de fréquences supérieures aux bandes d'ondes décamétriques:

Utilisation pour les communications et la diffusion de renseignements météorologiques dans le service mobile aéronautique (R) et le service mobile aéronautique par satellite (Résolution Nº 406).

Utilisation des fréquences 3023 kHz et 5680 kHz:

En commun par les services mobile aéronautique (R) et (OR) (Résolution Nº 403).

Utilisation (emploi amélioré) des fréquences du service mobile aéronautique (R) (Résolution Nº 405).
Utilisation non autorisée par d'autres services des fréquences des bandes attribuées au service mobile aéronautique (R) (Résolution Nº 407).
Voir aussi *Navires et aéronefs non parties à un conflit arrné* (Résolution Nº 11).
Voir aussi *Radiobalises de localisation des sinistres* (Résolution Nº 601).
Voir aussi Services de radiorepérage (Résolution Nº 600).

Service mobile maritime:

Emploi de la technique de la BLU dans les bandes du service radiotéléphonique comprises entre 1605 kHz et 4000 kHz (Résolution Nº 306).
Espacement des fréquences dans la bande 156-174 MHz (Résolution Nº 308).
Établissement d'un système mondial coordonné pour le rassemblement des données concernant l'océanographie (Résolution Nº 314).
Fréquences à prévoir en vue de l'établissement et de la mise en ocuvre future de systèmes de télémesure, de télécomande et d'échange de données pour les mouvements des navires (Résolution Nº 310).
Fréquences navire-navire dans les bandes comprises entre 1605 kHz et 3600 kHz dans le Région 1, réexamen des zones d'utilisation des (Résolution Nº 303).
Identités dans le service mobile maritime — Voir *Identification des stations* (Résolution Nº 313).
Introduction de nouvelles procédures d'appel en télégraphie Morse A1A à ondes décamétriques et plan de répartition des voies associé (Résolution Nº 312).
Introduction d'un système d'appel sélectif numérique (Résolution Nº 311).
Mise en œuvre de la nouvelle disposition des voies utilisées pour la télégraphie Morse de classe A1A dans les bandes comprises entre 4000 kHz et 27 500 kHz (Résolution Nº 304).

Notification des fréquences non appariées utilisées par les stations de navire pour les systèmes à bande étroite de télégraphie à impression directe et de transmission de données (Résolution Nº 301).
Passage à la technique de la BLU des stations radiotéléphoniques dans les bandes comprises entre 1605 kHz et 4000 kHz (Résolution Nº 307).
Suppression éventuelle des taxes de station mobile pour la correspondance publique, date recommandée pour la (Résolution Nº 315).
Traitement par l'IFRB des fiches de notification d'assignation de fréquence aux stations océanographiques (Résolution Nº 301).
Utilisation et notification des fréquences appariées réservées aux systèmes à bande étroite de télégraphie à impression directe et de transmission de données fonctionnant dans les bandes d'ondes décamétriques (Résolution Nº 300).
Utilisation non autorisée des fréquences des bandes attribuées au service mobile maritime (Résolution Nº 309).
Voir aussi *Correspondance publique* (Résolution Nº 201).
Voir aussi *Détresse et sécurité* (Résolutions Nºs 200 et 305).
Voir aussi *Navires et aéronefs non parties à un conflit armé* (Résolution Nº 11).
Voir aussi *Radiobalises de localisation des sinistres* (Résolution Nº 601).
Voir aussi *Service mobile maritime* (Résolution Nº 316).
Voir aussi *Service radiocrepérage* (Résolution Nº 600).
Voir aussi *Services mobiles* (Résolution Nº 202).

Service mobile maritime par satellite:

Identités du service mobile maritime — Voir *Identification des stations* (Résolution Nº 313).
Voir aussi *Correspondance publique* (Résolution Nº 20).

Service de radiorepérage:

Utilisation pour le service de radionavigation, de certaines bandes de fréquences des ondes décamétriques et centimétriques (Résolution Nº 600).
Voir aussi *Service fixe* (Résolution Nº 38).

Service de Terre:

Voir *Service de radiodiffusion par satellite* (Résolutions Nºs 33 et 34).
Voir *Service fixe par satellite* (Résolution Nº 31).
Voir *Service spatiaux* (Résolutions Nºs 32 et 703).

Service mobiles:

Convocation de conférences chargées de définir des critères de partage pour l'utilisation des bandes des ondes métriques et décimétriques attribuées aux services fixe, de radiodiffusion et mobile dans la Région 3 (Résolution Nº 702).
Convocation d'une Conférence administrative mondiale des radiocommunications pour les services mobiles (Résolution Nº 202).
Réassignation des fréquences aux stations des services fixe et mobile fonctionnant dans certaines bandes attribuées aux services de radiolocalisation et d'amateur dans la Région 1 (Résolution Nº 38).
Voir aussi *Correspondance publique* (Résolution Nº 201).
Voir aussi *Détresse et sécurité* (Résolutions Nºs 200 et 305).
Voir aussi *Services de radiodiffusion par satellite* (Résolution Nº 31).
Voir aussi *Service fixe* (Résolution Nº 8).

Services spatiaux:

Coopération internationale et assistance technique (Résolution Nº 15).
Méthodes de calcul et critères de brouillage en ce qui concerne le partage des bandes de fréquences entre services de radiocommunication spatiale et services de radiocommunication de Terre ou entre services de radiocommunication spatiale (Résolution Nº 703).
Utilisation des assignations de fréquence aux stations de radiocommunication de Terre et de radiocommunication spatiale dans les bandes 11,7-12,2 GHz dans la Région 3 et 11,7-12,5 GHz dans la Région 1 (Résolution Nº 32).
Utilisation équitable par tous les pays, avec égalité de droits, des bandes de fréquences attribuées aux services de radiocommunication spatiale (Résolution Nº 2).
Voir aussi *Service de radiodiffusion par satellite* (Résolutions Nºs 33, 34, 503 et 506).

Technique de la bande laterale unique (BLU):

Voir *Service de radiodiffusion* (Résolution Nº 508).
Voir *Service mobile aéronautique (R)* (Résolution Nº 402).
Voir *Service mobile amaritime* (Résolutions Nºs 306 et 307).

Terminologie:

Nouvelle définition de certains termes contenus dans l'Annexe 2 à la Convention et applicables au Règlement des Radiocommunications (Résolution Nº 68).

Union international des telecommunications:

Exigeant consultatif international des radiocommunications (CCIR);

Comité consultatif international des radiocommunications (CCIR):

Voir *Conférences administratives* (Résolution Nº 17).
Voir *Coopération technique* (Résolution Nº 16).
Voir *Détresse et sécurité* (Résolution Nº 200).
Voir *Division du monde* (Résolutions Nºs 61 et 66).
Voir *Equipement* (Résolutions Nºs 63 et 64).
Voir *Gestion des fréquences* (Résolutions Nº 7 et 35).
Voir *Identification des stations* (Résolution Nº 313).
Voir *Propagation* (Résolutions Nºs 5 et 60).
Voir *Orbite des satellites géostationnaires* (Résolution Nº 3).
Voir *Règlement des Radiocommunications* (Résolution Nº 65).
Voir *Service de radiodiffusion* (Résolutions Nº 508, 509, 510 et 702).
Voir *Service de radiodiffusion par satellite* (Résolutions Nºs 31, 34, 505, 700 et 701).
Voir *Service fixe par satellite* (Résolution Nº 101).

Voir *Service mobile maritime* (Résolutions N^{os} 310 et 311).
Voir *Service de radiorepérage* (Résolution N° 600).
Voir *Service mobiles* (Résolution N° 202).
Voir *Services spatiaux* (Résolution N° 703).
Voir *Terminologie* (Résolution N° 68).

Comité consultatif international télégraphique et téléphonique (CCITT):

Voir *Coopération technique* (Résolution N° 16).
Voir *Correspondance publique* (Résolution N° 201).
Voir *Equipement* (Résolution N° 64).
Voir *Identification des stations* (Résolution N° 313).
Voir *Terminologie* (Résolution N° 68).

Comité international D'enregistrement des fréquences (IFRB):

Voir *Conférences administratives* (Résolution N° 17).
Voir *Emissions* (Résolution N° 36).
Voir *Fichier de référence international ees fréquences (FRIF)* (Résolution N° 30).
Voir *Gestion des fréquences* (Résolutions N^{os} 7 et 35).
Voir *Orbite des satellites géostationnaires* (Résolutions N^{os} 2, 3 et 4).
Voir *Règlement des Radiocommunications* (Résolution N° 6).
Voir *Service aéronautique mobile (R)* (Résolutions N^{os} 400, 401, 402, 404 et 407).
Voir *Service d'amateur par satellite* (Résolution N° 642).
Voir *Service de radiodiffusion* (Résolutions N^{os} 500, 501, 508 et 509).
Voir *Service de radiodiffusion par satellite* (Résolutions N^{os} 33, 502, 503, 507 et 701).
Voir *Service fixe* (Résolutions N^{os} 8, 9, 38 et 103).
Voir *Service fixe par satellite* (Résolutions N^{os} 100 et 102).
Voir *Service mobile maritime* (Résolutions N^{os} 300, 301, 302, 303, 309 et 314).
Voir *Service mobile* (Résolution N° 202).
Voir *Service spatiaux* (Résolution N^{os} 32 et 703).

Conférences administratives:

Voir *Détresse et sécurité* (Résolution N° 305).
Voir *Equipement* (Résolution N° 63).
Voir *Orbite des satellites géostationnaires* (Résolution N° 4).
Voir *Propagation* (Résolution N° 60).
Voir *Service de radiodiffusion* (Résolutions N^{os} 2, 3 et 4).
Voir *Service de radiodiffusion par satellite* (Résolutions N^{os} 2, 3 et 4).
Voir *Service mobile maritime* (Résolutions N^{os} 300, 310 et 314).
Voir *Service de radiorepérage* (Résolution N° 600).
Voir *Terminologie* (Résolution N° 68).

En outre, les Résolutions suivantes se rapportent d'une manière ou d'une autre aux futures conférences:

Voir aussi *Coopération technique* (Résolutions N^{os} 14, 16 et 316).
Voir aussi *Correspondance publique* (Résolution N° 201).
Voir aussi *Détresse et sécurité* (Résolutions N^{os} 200 et 309).
Voir aussi *Identification des stations* (Résolutions N^{os} 12, 13 et 313).
Voir aussi *Navires et aéronefs non parties à un conflit armé* (Résolution N° 11).
Voir aussi *Propagation* (Résolution N° 5).
Voir aussi *Radiobalises de localisation des sinistres* (Résolution N° 601).
Voir aussi *Service fixe* (Résolution N° 38).
Voir aussi *Service mobile aéronautique* (R) (Résolutions N^{os} 400, 401, 402, 403, 404, 405, 406 et 407).

Voir *Service de radiodiffusion par radiosatellite* (Résolutions N^{os} 507 et 701).
Voir *Service fixe par satellite* (Résolution N° 101).
Voir *Services de radiorepérage* (Résolution N° 600).
Voir *Services mobiles* (Résolution N° 202).

Secrétaire général:

Voir *Conférences administratives* (Résolution N° 17).
Voir *Coopération technique* (Résolutions N^{os} 5, 14, 16 et 316).
Voir *Détresse et sécurité* (Résolutions N^{os} 200 et 305).
Voir *Gestion des fréquences* (Résolutions N^{os} 7 et 37).

Voir *Identification des stations* (Résolutions Nos 12, 13 et 313).
Voir *Navires et aéronefs non parties à un conflit armé* (Résolution Nº 11).
Voir *Propagation* (Résolution Nº 60).
Voir *Règlement des Radiocommunications* (Résolutions Nos 6 et 65).
Voir *Service de radiodiffusion* (Résolutions Nos 502 et 701).
Voir *Service de radiodiffusion par satellite* (Résolutions Nos 500 et 508).
Voir *Service mobile aéronautique* (R) (Résolution Nº 404).
Voir *Service mobile maritime* (Résolutions Nos 310, 311 et 312).
Voir *Services de radiorepérage* (Résolution Nº 600).
Voir *Services spatiaux* (Résolution Nº 703).
Voir *Terminologie* (Résolution Nº 68).

Utilisation des techniques informatiques:

Voir *Gestion des fréquences* (Résolution Nº 37).

PARTIE B

Recommandations

SECTION I

Sujets de l'Index analytique (mots clés)

Recommandation Nº 1 — Communications en cas de catastrophes — services spatiaux:

Opérations de secours;
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 2 — Conferences administratives — services spatiaux:

Fichier de référence international des fréquences (FRIF);
Règlement des Radiocommunications;
Union Internationale des Télécommunications (conseil d'administration).

Recommandation Nº 3 — Transmission d'energie electrique:

Organisation internationale (ONU);
Union Internationale des Télécommunications (CCIR, sécretaire général).

Recommandation Nº 4 — Reseaux de radiocommunication (4000-27 500 kHz):

Gestion des fréquences.

Recommandation Nº 5 — Gestion des fréquences:

Coopération et asssistance techniques.

Recommandation Nº 6 — Coopération et assistance techniques:

Union Internationale des Télécommunications (IFRB).

Recommandation Nº 7 — Service mobile aéronautique (R) — service mobile maritime:

Licences.

Recommandation Nº 8 — Indentification des stations:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 9 — service de radiodiffusion — service mobile aéronautique (R) — service mobile maritime:

Union Internationale des Télécommunications (sécretaire général).

Recommandation Nº 10 — Conferences administratives:

Union Internationale des Télécommunications (sécretaire général).

Recommandation Nº 11 — Conferences administratives — Règlement des Radiocommunications:

Recommandation Nº 12 — Conferences administratives — Union Internationale des Télécommunications (conférences de plénipotentiaires):

Liaisons de connexion;
Orbite des satellites géostationnaires;
Service de radiodiffusion par satellite;
Service fixe;
Services de radiorepérage;
Services mobiles;
Services spatiaux;
Union Internationale des Télécommunications (conseil d'administration).

Recommandation Nº 13 — Règlement des Radiocommunications — Union Internationale des Télécommunications (conseil d'administration):

Union Internationale des Télécommunications (conférences administratives).

Recommandation Nº 30 — Controle des émissions:

Organisations internationales (ONU);
Union Internationale des Télécommunications (CCIR, IFRB).

Recommandation Nº 31 — Application des techniques informatiques — Gestion des fréquences:

Union Internationale des Télécommunications (CCIR, IFRB, secrétaire général).

Recommandation Nº 60 — Normes techniques:

Union Internationales des Télécommunications (CCIR, IFRB).

Recommandation Nº 61 — Normes techniques:

Gestion des fréquences;
Union Internationale des Télécommunications (CCIR, IFRB).

Recommandation Nº 62 — Émissions:

Union Internationale des Télécommunications (CCIR, IFRB).

Recommandation Nº 63 — Largeurs de bande:

Union Internationale des Télécommunications (CCIR, IFRB).

Recommandation Nº 64 — Gestion des fréquences:

Normes techniques;
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 65 — Gestion des fréquences:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 66 — Émissions:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 67 — Terminologie:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 68 — Propagation:

Normes techniques;
Organisations internationales (Union radioscientifique internationales);
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 69 — Equipement:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 70 — Equipement:

Normes techniques;
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 71 — Equipement.
Recommandation Nº 72 — Terminologie:

Union Internationale des Télécommunications (CCIR, CCITT, conférences administratives, secrétaire général).

Recommandation Nº 73 — Terminologie:

Règlement des Radiocommunications;
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 74 — Unites SI.
Recommandation Nº 100 — Diffusion Tropospherique:

Union Internationale des Télécommunications (CCIR, conférences administratives, conseil d'administration).

Recommandation Nº 101 — Liaisons de connexion — service de radiodiffusion par satellite — service fixe par satellite:

Services spatiaux;
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 102 — Faisceaux hertziens:

Service fixe par satellite;
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 103 — Service fixe par satellite.
Recommandation Nº 200 — Détresse et sécurité:

Organisations internationales (OMCI);
Service mobile maritime;
Services mobiles;
Union Internationale des Télécommunications (conférences administratives, secrétaire général).

Recommandation Nº 201 — Détresse et sécurité:

Organisations internationales (OMCI);
Service mobile maritime;
Service mobile maritime par satellite;
Union Internationale des Télécommunications (CCIR, conférences administratives).

Recommandation N° 202 — Détresse et sécurité:

Règlement des Radiocommunications;
Union Internationale des Télécommunications (conférences administratives).

Recommandation N° 203 — Détresse et sécurité — service mobile maritime:

Organisations internationales (OMCI);
Règlement des Radiocommunications;
Union Internationale des Télécommunications (conférences administratives, secrétaire général).

Recommandation N° 204 — Règlement des Radiocommunications — service mobile aéronautique (R) — service mobile maritime — services mobiles:

Organisations internationales (OACI, OMCI);
Union Internationale des Télécommunications (conférences administratives, secrétaire général).

Recommandation N° 300 — Service mobile maritime — services mobiles:

Organisations internationales (OMCI);
Union Internationale des Télécommunications (CCIR, conférences administratives, conseil d'administration, secrétaire général).

Recommandation N° 301 — Service mobile maritime — services mobiles:

Organisations internationales (OMCI);
Union Internationale des Télécommunications (CCIR conférences administratives, conseil d'administration, secrétaire général).

Recommandation N° 302 — Service mobile maritime:

Gestion des fréquences;
Union Internationale des Télécommunications (CCIR).

Recommandation N° 303 — Détresse et sécurité:

Service mobile maritime.

Recommandation N° 304 — Service mobile maritime:

Union Internationale des Télécommunications (secrétaire général).

Recommandation N° 305 — Règlement des Radiocommunications — service mobile maritime:

Union Internationale des Télécommunications (conférences administratives).

Recommandation N° 306 — Détresse et sécurité — service mobile maritime.
Recommandation N° 307 — Détresse et sécurité — service mobile maritime:

Union Internationale des Télécommunications (conférences administratives, CCIR).

Recommandation N° 308 — Service mobile maritime:

Union Internationale des Télécommunications (conférences administratives).

Recommandation N° 309 — Détresse et sécurité — service mobile maritime:

Organisations internationales (OMCI);
Union Internationale des Télécommunications (conférences administratives, secrétaire général).

Recommandation N° 310 — Service mobile maritime:

Organisations internationales (OMCI);
Union Internationale des Télécommunications (CCIR, CCITT, conférences administratives, secretaire général).

Recommandation N° 311 — Détresse et sécurité — Service mobile maritime.
Recommandation N° 312 — Service mobile maritime:

Union Internationale des Télécommunications (CCIR, CCITT).

Recommandation N° 313 — Service mobile maritime par satellite:

Union Internationale des Télécommunications (conférences administratives).

Recommandation N° 400 — Service mobile aeronautique (R):

Organisations internationales (OACI);
Union Internationale des Télécommunications (IFRB, secrétaire général).

Recommandation N° 401— Service mobile aeronautique (R).
Recommandation N°. 402 — Service mobile aeronautique (R):

Gestion des fréquences;
Organisations internationales (OACI);
Union Internationale des Télécommunications (IFRB, secrétaire général).

Recommandation N° 403 — Service mobile aeronautique (R):

Organisations internationales (OACI);
Union Internationale des Télécommunications (IFRB).

Recommandation N° 404 — Service mobile aeronautique (R):

Gestion des fréquences;
Union Internationale des Télécommunications (IFRB).

Recommandation Nº 405 — Service mobile aeronautique par satellite (R):

Organisations internationales (OACI);
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 406 — Service mobile aeronautique (OR):

Règlement des Radiocommunications;
Union Internationale des Télécommunications (conférences administratives, conseil d'administration).

Recommandation Nº 407 — Service mobile aeronautique (R):

Règlement des Radiocommunications;
Union Internationale des Télécommunications (conférences administratives).

Recommandation Nº 500 — Conférences administratives — service de radiodiffusion:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 501 — Conférences administratives — service de radiodiffusion:

Techniques de la bande latérale unique;
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 502 — Service de radiodiffusion:

Organisations internationales (ONU, ONUDI, UNESCO);
Union Internationale des Télécommunications (CCIR, secrétaire général).

Recommandation Nº 503 — Service de radiodiffusion:

Union Internationale des Télécommunications (CCIR)

Recommandation Nº 504 — Service de radiodiffusion:

Union Internationale des Télécommunications (CCIR, conférences administratives, conseil d'administration).

Recommandation Nº 505 — Service de radiodiffusion par satellite:

Propagation;
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 507 — Service de radiodiffusion par satellite:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 508 — Service de radiodiffusion par satellite:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 600 — Service de radioreperage:

Organisations internationales (OACI, OMCI).

Recommandation Nº 601 — Service de radioreperage:

Organisations internationales (OACI).

Recommandation Nº 602 — Service de radioreperage:

Organisations internationales (AISM, OMCI);
Union Internationale des Télécommunications (CCIR, conférences administratives, conseil d'administration, secrétaire général).

Recommandation Nº 603 — Service de radiorepérage.
Recommandation Nº 604— Detresse et securite — radiobalises de localisation des sinistres:

Organisations internationales (AISM, OMCI);
Service mobile aéronautique (R);
Service mobile maritime;
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 605 — Services de radioreperage:

Organisations internationales (OMCI);
Union Internationale des Télécommunications (CCIR, conférences administratives).

Recommandation Nº 620 — Meteorologie:

Organisations internationales (OMM).

Recommandation Nº 700 — Services spatiaux.
Recommandation Nº 701 — Service de radioastronomie:

Union Internationale des Télécommunications (conférences administratives).

Recommandation Nº 702— Emissions:

Union Internationale des Télécommunications (conférences administratives).

Recommandation Nº 703 — Services de radioreperage — services mobiles:

Service fixe.

Recommandation Nº 704 — Service de radiodiffusion — services de radioreperage:

Gestion des fréquences;
Organisations internationales (OACI);
Union Internationale des Télécommunications (CCIR).

Recommandation Nº 705 — Service de radiodiffusion — services de radiodiffusion par satellite:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 706 — Service fixe — service fixe par satellite — services mobiles — services spatiaux:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 707 — Service inter-satellites — service de radioreperage:

Règlement des Radiocommunications;
Union Internationale des Télécommunications (CCIR, conférences administratives).

Recommandation Nº 708 — Service de Terre — Services spatiaux:

Union Internationale des Télécommunications (CCIR).

Recommandation Nº 709 — Service inter-satellites — service mobile aeronautique (R):

Union Internationale des Télécommunications (CCIR, conférences administratives).

Recommandation Nº 710 — Service inter-satellites — service de radioreperage:

Union Internationale des Télécommunications (CCIR, conférences administratives).

Recommandation Nº 711 — Services spatiaux:

Gestion des fréquences;
Règlement des Radiocommunications;
Union Internationale des Télécommunications (CCIR, conférences administratives).

Recommandation Nº 712 — Service de radiodiffusion par satellite :

Union Internationale des Télécommunications (CCIR).

SECTION II

Aplication des techniques informatiques:

Manuel sur l'application des techniques informatiques à la gestion du spectre radioélectrique (Recommandation Nº 31).

Communications en cas de catastrophes:

Utilisation de systèmes de radiocommunications spatiales en cas de catastrophes naturelles, etc. (Recommandation Nº 1).

Conferences administratives:

Convocation de futures conférences administratives des radiocommunications traitant de services déterminés (Recommandation Nº 12).
Elaboration de la documentation technique nécessaire pour la Conférence administrative mondiale des radiocommunications pour la radiodiffusion à ondes décamétriques (Recommandation Nº 500).
Étude de la technique de la bande latérale unique pour la Conférence administrative mondiale des radiocommunications pour la radiodiffusion à ondes décamétriques (Recommandation Nº 501).
Examen, par les conférences administratives mondiales des radiocommunications, de l'état d'occupation du spectre des fréquences dans le domaine des radiocommunications spatiales (Recommandation Nº 2).
Numérotation figurant dans la marge du Règlement des Radiocommunications (Recommandation Nº 11).
Présentation des propositions de modification aux textes du Règlement des Radiocommunications (Recommandation Nº 10).
Autres Recommandations concernant les conférences:

Voir *Détresse et sécurité* (Recommandations Nºs 200 et 201).
Voir *Diffusion troposphérique* (Recommandation Nº 100).
Voir *Emissions* (Recommandation Nº 702).
Voir *Règlement des Radiocommunications* (Recommandations Nºs 13 et 234).
Voir *Service de radioastronomie* (Recommandation Nº 701).
Voir*Service de radiodiffusion* (Recommandation Nº 504).
Voir *Service intersatellites* (Recommandations Nºs 707, 709 et 710).
Voir *Service mobile aéronautique (OR)* (Recommandation Nº 406).
Voir *Service mobile aéronautique (R)* (Recommandation Nº 407).
Voir Service mobile maritime (Recommandations Nºs 203, 300, 301, 305, 308, 309 et 310).
Voir *Service mobile maritime par satellite* (Recommandation Nº 313).
Voir *Services de radiorepérage* (Recommandations Nºs 602 et 605).
Voir *Services de Terre* (Recommandation Nº 711).
Voir *Terminologie* (Recommandation Nº 72).

Contrôle des emissions:

Contrôle international des émissions (Recommandation Nº 30).

Cooperation et assistance techniques:

Besoins pratiques des pays qui ont besoin d'assistance spéciale (Recommandation Nº 6).
Voir *Gestion des fréquences* (Recommandation Nº 5).

Detresse et sécurité:

Date d'entrée en vigueur de la bande de garde de 10 kHz pour la fréquence 500 kHz dans le service mobile (détresse et appel) (Recommandation Nº 200).
Désignation d'une fréquence dans les bandes 435-495 kHz ou 505-526,5 kHz pour l'émission par les stations côtières des bulletins météorologiques et des avis aux navigateurs, au moyen de la télégraphie à impression directe à bande étroite (Recommandation Nº 309).
Fréquence réservée aux besoins de la sécurité dans les bandes du service mobile maritime comprises entre 1605 kHz et 3800 kHz (Recommandation Nº 307).
Protection contre les brouillages préjudiciables des fréquences de détresse et de sécurité (Recommandation Nº 202).
Signal à fréquence acoustique consécutif au signal d'alarme radiotéléphonique émis par les stations côtières (Recommandation Nº 311).
Trafic de détresse, d'urgence et de sécurité (Recommandation Nº 201).
Utilisation de fréquences supplémentaires en plus de la fréquence porteuse 2182 kHz aux fins de détresse et de sécurité (Recommandation Nº 303).
Utilisation future de la bande 2170-2194 kHz (Recommandation Nº 203).
Utilisation future et caractéristiques des radiobalises de localisation des sinistres (Recommandation Nº 604).
Veille sur la fréquence 156,8 MHz par les stations côtières aux fins de détresse (Recommandation Nº 306).

Diffusion troposphérique:

Bandes de fréquences préférentielles pour les systèmes qui utilisent la propagation par diffusion troposphérique (Recommandation Nº 100).

Emissions:

Rayonnements non essentiels

Dans le service de radiodiffusion par satellite (Recommandation Nº 507).
Études sur les niveaux maximaux tolérés de rayonnements non essentiels (Recommandation Nº 66).

Recherche d'émissions intentionnelles d'origine extraterrestre (Recommandation Nº 702).
Supplément aux caractéristiques additionnelles de classification des émissions — appendice 6 (Recommandation Nº 62).

Equipement:

Étude des caractéristiques techniques de l' —— (Recommandation Nº 70).
Normalisation des caractéristiques techniques et d'exploitation des matériels radioélectriques (Recommandation Nº 71).
Tolérances de fréquence des émetteurs (Recommandation Nº 69).

Faisceaux hertziens:

Méthodes de modulation pour les faisceaux hertziens du point de vue du partage des bandes de fréquence avec les systèmes du service fixe par satellite (Recommandation Nº 102).

Fichier de référence international des fréquences (FRIR):

Voir *Services spatiaux* (Recommandation Nº 2).

Gestion des fréquences:

Manuel sur l'application des techniques informatiques à la gestion du sprectre radioélectrique (Recommandation Nº 31).
Moyens à mettre en oeuvre pour réduire l'encombrement de la bande 3-30 MHz (Recommandation Nº 5).
Partage du sprectre et utilisation des bandes de fréquences (Recommandation Nº 65).
Rapports de protection et champs minimaux nécessaires (Recommandation Nº 64).
Voir *Normes techniques* (Recommandation Nº 61).
Voir *Réseaux de radiocommunication (4000-27 500 kHz)* (Recommandation Nº 4).
Voir *Service de radiodiffusion* (Recommandation Nº 704).
Voir *Service mobile aéronautique (R)* (Recommandations Nºs 402 et 404).
Voir *Service mobile maritime* (Recommandation Nº 302).
Voir *Services spatiaux* (Recommandation Nº 711).

Identification des stations:

Identification automatique des stations (Recommandation Nº 8).

Largeurs de bande:

Calcul des largeurs de bande (Recommandation Nº 63).

Liaisons de connexion:

Liaisons de connexion dans le service de radiodiffusion par satellite (Recommandation Nº 101).
Voir aussi *Conférences administratives* (Recommandation Nº 12).

Licences:

Voir *Service mobile aéronautique (R)* (Recommandation Nº 7).
Voir *Service mobile maritime* (Recommandation Nº 7).

Meteorologie:

Service des auxiliaires de la météorologie (Recommandation Nº 620).

Normes techniques:

Normes techniques de l'IFRB (Recommandation Nº 60).
Normes techniques nécessaires à l'évaluation des brouillages préjudiciables dans les bandes de fréquences supérieures à 28 MHz (Recommandation Nº 61).
Voir *Equipement* (Recommandation Nº 70).

Voir *Gestion des fréquences* (Recommandation N° 64).
Voir *Propagation* (Recommandation N° 68).

Operations de secours:

Voir *Communication en cas de catastrophes* (Recommandation N° 1).

Orbite des satellites géostationnaires:

Voir *Conférences administratives* (Recommandation N° 12).

Organisations internationales:

Recommandations présentant un intérêt pour les organisations suivantes:

Association internationale de signalisation maritime (AISM):

Voir *Services de radiorepérage* (Recommandation N° 602).

Organisation des Nations Unies (ONU):

Voir *Contrôle des émissions* (Recommandation N° 30).
Voir *Equipement* (Recommandation N° 502).
Voir *Service de radiodiffusion* (Recommandation N° 502).
Voir *Transmission d'énergie électrique* (Recommandation N° 3).

Organisation des Nations Unies pour le développement industriel (ONUDI):

Voir *Equipement* (Recommandation N° 502).
Voir *Service de radiodiffusion* (Recommandation N° 502).

Organisation des Nations Unies pour l'éducation, la science et la culture (UNESCO):

Voir *Service de radiodiffusion* (Recommandation N° 502).

Organisation intergouvernamentale consultative de la navigation maritime (OMCI):

Voir *Détresse et sécurité* (Recommandations N°s 200, 201 et 203).
Voir *Radiobalises de localisation des sinistres* (Recommandation N° 604).
Voir *Règlement des Radiocommunications* (Recommandation N° 204).
Voir *Service mobile maritime* (Recommandations N°s 300, 301, 309 et 310).
Voir *Services de radiorepérage* (Recommandations N°s 600, 602 et 605).

Voir *Services de radiorepérage* (Recommandations N°s 600, 601 et 704).

Organisation météorologique mondiale (OMM):

Voir *Météorologie* (Recommandation N° 620).

Union internationale radioscientifique:

Voir *Propagation* (Recommandation N° 68).

Propagation:

Études et prévisions de la propagation et des bruits radioélectriques (Recommandation N° 68).
Voir aussi *Service de radiodiffusion par satellite* (Recommandation N° 505).

Radiobalises de localisation des sinistres:

Utilisation future et caractéristique des radiobalises de localisation des sinistres (Recommandation N° 604).

Règlement des radiocommunications:

Applications des chapitres NX, NXI et NXII du remaniement du Règlement des Radiocommunications (Recommandation N° 204).
Conférence administrative mondiale des radiocommunications pour une révision générale ou partielle de Règlement des Radiocommunications (Recommandation N° 13).
Numérotation figurant dans la marge du Règlement des Radiocommunications (Recommandation N° 11).
Utilisation des voies 15 et 17 de l'appendice 18 par les stations de communications de bord (Recommandation N° 305).
Voir *Détresse et sécurité* (Recommandations N°s 202 et 203).
Voir *Service mobile aéronautique (OR)* (Recommandation N° 406).
Voir *Service mobile aéronautique (R)* (Recommandation N° 407).
Voir *Services de radiorepérage* (Recommandation N° 707).
Voir *Services spatiaux* (Recommandations N°s 2 et 711).
Voir *Terminologie* (Recommandation N° 73).

Reseaux de radiocommunication (4000-27 500 kHz):

Amélioration du groupement des liaisons des réseaux nationaux et internationaux de radiocommunications fonctionnant dans les bandes comprises entre 400 kHz et 27 500 khz (Recommandation N° 4).

Service de radioastronomie:

Utilisation de la bande de fréquences 1330-1400 MHz par le service de radioastronomie (Recommandation N° 701).

Service de radiodiffusion:

Compatibilité entre le service de radiodiffusion dans la bande 100-108 MHz et le service de radionavegation aéronautique dans la bande 108-117,975 MHz (Recommandation N° 704).

Critères à appliquer au partage des fréquences entre le Service de radiodiffusion par satellite et le service de radiodiffusion de Terre dans la bande 620-790 MHz (Recommandation N° 705).
Elaboration de la documentation technique pour la Conférence administrative mondiale des radiocommunications pour la radiodiffusion à ondes décamétriques (Recommandation N° 500).
Étude de la technique de la bande latérale unique pour la Conférence administrative mondiale des radiocommunications pour la radiodiffusion à ondes décamétriques (Recommandation N° 501).
Mesures à prendre pour empêcher le fonctionnement de stations de radiodiffusion à bord de navires ou d'aéronefs hors des limites des territoires nationaux (Recommandation N° 9).
Plan de radiodiffusion dans la bande 1605-1705 kHz dans la Région 2 (Recommandation N° 504).
Radiodiffusion en ondes décamétriques (Recommandation N° 503).
Spécifications des récepteurs de télévision à prix modique (Recommandation N° 502).

Service de radiodiffusion par satellite:

Antennes d'émission (Recommandation N° 508).
Critères à appliquer au partage des fréquences entre le service de radiodiffusion par satellite et le service de radiodiffusion de Terre dans la bande 620-790 MHz (Recommandation N° 705).
Harmoniques de la fréquence fondamentale (Recommandation N° 706).
Interdépendence entre la conception des récepteurs, le groupement des canaux et les critères de partage (Recommandation N° 712).
Liaisons de connexion dans le service de radiodiffusion par satellite (Recommandation N° 101).
Propagation dans la bande des 12 GHz (Recommandation N° 505).
Rayonnements non essentiels (Recommandation N° 507).
Voir aussi *Conférences administratives* (Recommandation N° 12).

Services de radiorepérage:

Compatibilité entre le service de radiodiffusion dans la bande 100-108 MHz et le service de radionavigation aéronautique dans la bande 108-117,975 MHz (Recommandation N° 704).
Dispositions techniques concernant les radiophares maritimes dans la zone africaine (Recommandation n.° 603).
Nécessité de faire cesser le fonctionnement des stations des services fixe et mobile dans les bandes de fréquences 149,9-150,05 MHz et 399,9-400,05 MHz attribuées au service de radionavigation par satellite (Recommandation N° 703).
Radionavigation aéronautique — système destiné à éviter les collisions (Recommandation N° 601).
Radiophares maritimes (Recommandation N° 605).
Répondeurs (Recommandation N° 707).
Utilisation de la bande de fréquences 32-33 GHz, en partage entre le service inter-satellites et le service de radionavigation (Recommandation N° 707).
Utilisation de la bande de fréquences 9300-9500 MHz (Recommandation N° 600).
Utilisation de radiodétecteurs aéroportés dans les bandes de fréquences partagées par le service inter-satellites et le service de radiolocalisation (Recommandation N° 710).
Voir aussi *Conférences administratives* (Recommandation N° 12).

Services de terre:

Bandes de fréquence partagées par les services de radiocommunication spatiale et les services de radiocommunication de Terre (Recommandation N° 708).

Service fixe:

Partage des fréquences entre, d'une part le service d'exploration de la Terre par satellite (détecteurs passifs) et le service de recherche spatiale (déctecteurs passifs), et d'autre part, les services fixe, mobile, sauf mobile aéronautique, et fixe par satellite dans la bande 18,6-18,8 GHz (Recommandation N° 706).
Voir *Conférences administratives* (Recommandation N° 12).
Voir *Services de radiorepérage* (Recommandation N° 703).

Service fixe par satellite:

Dispersion de l'énergie de la porteuse dans le service fixe par satellite (Recommandation N° 103).
Liaisons de connexion dans le service de radiodiffusion par satellite (Recommandation N° 101).
Partage des fréquences entre, d'une part le service d'exploration de la Terre par satellite (détecteurs passifs), et le service de recherche spatiale (détecteurs passifs), et d'autre part les services fixe, mobile, sauf mobile aéronautique, et fixe par satellite dans la bande 18,6-18,8 GHz (Recommandation N° 706).
Voir *faisceaux hertziens* (Recommandation N° 102).

Services inter-satellites:

Partage des bandes de fréquences entre le service mobile aéronautique et le service inter-satellites (Recommandation N° 709).
Utilisation de la bande de fréquences 32-33 GHz, ne partage entre le service inter-satellites et le service de radionavigation (Recommandation N° 707).
Utilisation de radiodétecteurs aéroportés dans les bandes de fréquences partagées par le service inter-satellites et le service de radiolocalisation (Recommandation N° 710).

Service mobile aéronautique (OR):

Révision du Plan d'allotissement des fréquences — appendice 26 (Recommandation N° 406).

Service mobile aéronautique par satellite (R):

Étude de l'utilisation de ce service (Recommandation N° 405).

Service mobile aéronautique (R):

Application des chapitres NX, NXI et NXII du Remaiement du Règlement des radiocommunications (Recommandation N° 204).
Coopération en vue de l'emploi efficace des fréquences désignées pour utilisation mondiale (Recommandation N° 402).
Emploi efficace des fréquences désignées pour utilisation mondiale (Recommandation N° 401).

Mesures à prendre pour empêcher le fonctionnement de stations de radiodiffusion à bord de navire ou d'aéronefs hors des limites des territoires nationaux (Recommandation Nº 9).
Mise au point de techniques qui contribueront à réduire l'encombrement des bandes d'ondes décamétriques (Recommandation Nº 403).
Modèles normalisés de licences à délivrer aux stations de navire et aux stations d'aéronef (Recommandation Nº 7).
Nº 27/123 de l'Appendice 27 Aer2 (subdivison de Zone 5B) (Recommandation Nº 407).
Partage des bandes de entre le service mobile aéronautique et le service intersatellites (Recommandation Nº 709).
Passage au nouveau Plan d'allotissement des fréquences entre 2850 kHz et 22 000 kHz (Recommandation Nº 400).
Utilisation de la bande 136-137 MHz (Recommandation Nº 404).
Voir aussi *Détresse et sécurité* (Recommandation Nº 604).

Services mobiles:

Application des chapitres NX, NXI et NXII du Remaniement du Règlement des Radiocommunications (Recommandation Nº 204).
Nécessité de faire cesser les fontionnement des stations des services fixe et mobile dans les bandes de fréquences 149,9-150,05 MHz et 399,9-400,05 MHz attribuées au service de radionavigation par satellite (Recommandation Nº 703).
Planification de l'utilisation des fréquences dans la bande 435-526,5 kHz dans la Région 1 (Recommandation Nº 300).
Planification de l'utilisation des fréquences dans les bandes entre 1606,5 kHz et 3400 kHz dans la Région 1 (Recommandation Nº 301).
Voir *Conférences administratives* (Recommandation Nº 12).
Voir *Détresse et sécurité* (Recommandation Nº 200).

Service mobile maritime:

Application des Chapitres NX, NXI et NXII du Remaniement du Réglement des Radiocommunications (Recommandation Nº 204).
Désignations de fréquences des bandes d'ondes hectométriques à utiliser en commun par les stations côtières radiotéléphoniques pour les communications avec les stations de navire de nationalités autres que la leur (Recommandation Nº 308).
Désignation d'une fréquence dans les bandes 435-495 kHz ou 505-526,5 kHz pour l'énissions par les stations côtières des bulletins météorologiques et des avis aux navigateurs, au moyen de la télégraphie à impression directe á bande étroite (Recommandation Nº 309).
Études de l'interconnexion des systèmes de radiocommunication mobiles maritimes aves les réseaux télégraphie et télégraphique (Recommandation Nº 312).
Fréquence réservée aux besoins de la sécurité dans les bandes comprises entre 1605 kHz et 3800 kHz (Recommandation Nº 307).
Fréquences destinés à être utilisées dans le monde entier par les navire de toutes catégories ainsi que par les stations côtières — appendice 16, section B (Recommandation Nº 304).
Meilleure utilisation des voies radiotéléphoniques à ondes décamétriques par les stations côtières (Recommandation Nº 302).
Mesures à prendre pour empêcher le fonctionnement de stations de radiodiffusion à bord de navires ou d'aéronefs hors des limites des territoires nationaux (Recommandation Nº 9).
Modèles normalisés de licences à délivrer aux stations de navire et aux stations d'aéronefs (Recommandation Nº 7).
Partage des fréquences entre, d'une part le service d'exploiration de la Terre par satellite (détecteurs passifs) et le service de recherche spatiale (détecteurs passifs), et d'autre par les services fixe, mobile, sauf mobile aéronautique, et fixe par satellite dans la bande 18,6-18,8 GHz (Recommandation Nº 706).
Planification de l'utilisation des fréquences dans la bande 435-526,5 kHz dans la Région 1 (Recommandation Nº 300).
Planification de l'utilisation des fréquences dans les bandes comprises entre 1606,5 kHz et 340 kHz dans la Région 1 (Recommandation Nº 301).
Système automatique de radiocommunication sur ondes décimétriques pour le service mobile maritime (Recommandation Nº 310).
Utilisation des voies 15 et 17 de l'Appendice 18 par les stations de communication de bord (Recommandation Nº 305).
Utilisation d'un signal à fréquence acoustique consécutif au signal d'alarme radiotéléphonique émis par les stations côtières (Recommandation Nº 311).
Utilisation future de la bande 2170-2194 kHz (Recommandation Nº 203).
Veille sur la fréquence 156,8 MHz par les stations côtières aux fins de détresse (Recommandation Nº 306).
Voir *Détresse et sécurité* (Recommandations Nºs 200, 201, 303 et 604).
Voir *Services de radiorepérage* (Recommandation Nº 604).

Service mobile maritime par satellite:

Dispositions temporaires concernant les aspects techniques et d'exploitation (Recommandation Nº 313).
Voir aussi *Détresse et sécurité* (Recommandation Nº 201).

Service spatiaux:

Bandes de fréquences partagées par les services de radiocommunication spatiales entre eux ainsi qu'entre les services de radiocommunication spatiale et les services de radiocommunication de Terre (Recommandation Nº 708).
Coordination des stations terriennes (Recommandation Nº 711).
Examen, par les conférences administratives mondiales des radiocommunication, de l'état d'occupation du spectre des fréquences dans le domaine des radiocommunications spatiales (Recommandation Nº 2).
Partage des fréquences entre, d'une part le service d'exploration de la Terre par satellite (détecteurs passifs) et le service de recherche spatiale (détecteurs passifs), et d'autre par les services fixe, mobile, sauf mobile aéronautique, et fixe par satellite dans la bande 18,6-18,8 GHz (Recommandation Nº 706).
Utilisation de systèmes de radiocommunications spatiales en cas de catastrophes naturelles, d'épidémies, de famines et d'autre situations critiques analogues (Recommandation Nº 1).
Utilisation et partage des bandes de fréquences attribuées aux radiocommunication spatiales (Recommandation Nº 700).
Voir *Conférences administratives* (Recommandation Nº 12).
Voir *Liaisons de connexion* (Recommandation Nº 101).

Techniques de la bande laterale unique:

Voir *Service de radiodiffusion* (Recommandation Nº 501).

Terminologie:

Définition des termes «zone de sevice» et «zone de couverture» (Recommandation Nº 67).
Emploi du terme «canal» dans le Règlement des Radiocommunications (Recommandation Nº 73).
Généralités (Recommandation Nº 72).

Transmission d'energie électrique:

Transmission d'énergie électrique au moyen de fréquences radioélectriques à partir d'un engin spatial (Recommandation Nº 3).

Union International des Télécommunications:

Exigeant une intervention directe de l'Union:

Comité consultatif international des radiocommunications (CCIR):
